ICD-9 2012: Prepare for a Slew of New Case Mix Codes

Welcome improved dementia reporting.

If you thought the 2012 ICD-9 updates would be minimal because of the focus on transitioning to ICD-10 in 2013, you're in for a surprise. As of Oct. 1, you'll have more changes than in previous years: 166 new codes to grapple with, along with 168 revisions and 88 deletions.

"There are a lot of changes for this last year of regular updates to ICD-9-CM," says **Judy Adams, RN, BSN, HCS-D, COS-C** with **Adams Home Care Consulting** in Chapel Hill, N.C.

Fast track: Many of the new codes were first introduced at the March 2011 **ICD-9 Coordination and Maintenance Committee** meeting, says attendee **Therese Rode, RHIT** senior coding manager with **Inova VNA Home Health** in Falls Church, Va. While code suggestions can often take years to become reality, the speedy approval cycle this year is likely due to the plan for limited changes next year as the implementation date for ICD-10 draws nearer, she says.

Gear Up for Potential Case Mix Additions

The final decision as to which new codes will be added to the home health PPS case mix list is determined in the annual PPS update, Adams says. However, there are several new codes within categories that are currently case mix so it's likely these new codes to be case mix as well.

Neoplasm of the skin: There are 40 new five-digit codes in category 173.x (Other and unspecified malignant neoplasm of the skin). These new codes specify particular sites such as lip, eyelid, ear, other parts of face, scalp and skin of neck, trunk, upper limb, lower limb, other specific sited of skin, and skin, site unspecified, Adams says.

The new fifth digits differentiate between basal cell carcinoma and squamous cell carcinomas of the skin. These same differentiations are found in ICD-10.

Category 173 is already a case mix diagnosis in the Neoplasm category so all of these codes will be case mix as well as proxies for earning non-routine supply points in home health, Adams says.

Thalassemia: There are six new five-digit codes for specific forms of thalassemia replacing current code 282.49 (Other thalassemia). These more specific codes can be expected to be case mix diagnoses since category 282 (Hereditary hemolytic anemias) is already in the Blood Disorder case mix category, Adams says.

However, the number of patients with these conditions seen in home health is likely to be limited, she says. Thalassemia is a rare condition passed down through families resulting in destruction of red blood cells.

Pancytopenia: Three more specific five-digit codes related to pancytopenia at 284.1x (Pancytopenia) will also likely be case mix since category 284 is already case mix in the Blood Disorder category, Adams says.

Dementia: New codes 294.20 (Dementia, unspecified, without behavioral disturbance) and 294.21 (Dementia, unspecified, with behavioral disturbance) are a welcome addition because they allow home health coders to report dementia not related to another disease process like Alzheimer's, says **Jennifer Warfield, BSN, HCS-D, COSC**, education director with **PPS Plus Software** in Biloxi, Miss. These new codes also allow you to differentiate whether the patient exhibits behavioral disturbances, Warfield says. These codes will replace 294.8 (Dementia NOS).

Another change to the dementia codes is the addition of the underlying disease of Parkinson's to the 294.1x (Dementia in conditions classified elsewhere) subcategory and the removal of wandering from the code. New code V40.31

(Wandering in diseases classified elsewhere) indicates wandering for those with dementia and it is a new "use additional code" note at 294.11 (Dementia in conditions classified elsewhere with behavioral disturbance) and 294.21 (Dementia, unspecified, with behavioral disturbance), says **Lisa Selman-Holman, JD, BSN, RN, HCS-D, COS-C**, consultant and principal of **Selman-Holman & Associates** and **CoDR -- Coding Done Right** in Denton, Texas.

While the **Centers for Medicare & Medicaid Services** will have to designate this new subcategory as a case mix diagnosis, it's reasonable to believe these new dementia codes will be added as case mix diagnoses in the Psych 2 category, Adams says.

Fractures: Two new codes, 808.44 (Multiple closed pelvic fractures without disruption of pelvic circle) and 808.54 (Multiple open pelvic fractures without disruption of pelvic circle) along with revised codes 808.43 (Multiple closed pelvic fractures with disruption of pelvic circle) and 808.53 (Multiple open pelvic fractures with disruption of pelvic circle) will be case mix diagnoses in Ortho 1 category since all of the 808 (Fracture of pelvis) category is case mix, Adams says.

The pelvic fracture codes were catch-alls previously, Warfield says. The new codes add specificity and allow you to indicate whether the fracture involves the disruption of the pelvic ring.

Another improvement that these codes bring about is to allow you to list one single code when the patient has multiple pelvic fractures, Rode says.

Editors note: That's not all! We've covered the likely changes to the case mix diagnosis list in this article, but there are still many other new codes that will impact home health. Watch for more articles on the changes, including an article discussing changes to how you'll code memory disturbance, bladder disorders, and complications as well as the new V codes you'll soon have available, in upcoming issues of Home Health ICD-9 Alert.
