

## Long-Term Care Survey Alert

### Tool: Brush Up On The ABCs Of End-of-Life Care

**CMS suggests this short cut to covering the essentials of end-of-life care planning.**

Adapt the **ABCDE** mnemonic below to help manage residents' symptoms and meet the residents' physical and emotional needs at the end of life:

**A: Ask** the resident or his or her legal representative about (and screen for) pain and other symptoms related to the resident's end of life status on admission and periodically thereafter.

**A: Assess** regularly and systematically for symptoms (such as dyspnea, fatigue, declining function, anorexia/eating difficulties/weight loss, pain, loneliness, anxiety/apprehension, depression, constipation, and delirium) and their impact on the resident.

**B: Believe** the resident's report of pain or other symptoms, what precipitates it or makes it worse, and what relieves it.

**C: Choose** symptom control options that are appropriate for the resident.

**D: Deliver** interventions in a timely, logical, and coordinated manner.

**E: Empower** the resident to participate in defining the goals of treatment and planning the interventions to the extent possible; and

**E: Evaluate** the effectiveness of the chosen interventions.
