Reader Question: Review This Password Guidance Before Your Next Update

Question: How often should we change our passwords for our computers? Right now our information technology consultant set it up so we change the passwords every 30 days, but my staff is a bit overwhelmed with the need to constantly remember new passwords, and I think the efforts are distracting them from their jobs.

Ohio Subscriber

Answer: While frequent password changes have been the norm for years, the **National Institute of Standards and Technology** (NIST) updated their guidelines and recommendations concerning identity security.

"Verifiers SHOULD NOT impose other composition rules (e.g., requiring mixtures of different character types or prohibiting consecutively repeated characters) for memorized secrets. Verifiers SHOULD NOT require memorized secrets to be changed arbitrarily (e.g., periodically). However, verifiers SHALL force a change if there is evidence of compromise of the authenticator," NIST says (all emphasis original).

With this advice, encourage your IT manager and all your staff who use computers to choose a strong password (or "secret," in NIST parlance) for each function requiring a password, and don't require any changes unless you must.

Additionally, NIST does not recommend requiring that passwords have multiple composition rules, like mixed-case letters, numerals, or special characters.

"These rules provide less benefit than might be expected because users tend to use predictable methods for satisfying these requirements when imposed (e.g., appending a ! to a memorized secret when required to use a special character). The frustration they often face may also cause them to focus on minimally satisfying the requirements rather than devising a memorable but complex secret," NIST says.

When updating your password rules and regulations, NIST recommends creating a "blacklist" of passwords that are common enough to be vulnerable to attack.
