RIN 0938–AU44

Medicare Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals and the Long-Term Care Hospital Prospective Payment System and Proposed Policy Changes and Fiscal Year 2022 Rates; Quality Programs and Medicare Promoting Interoperability Program Requirements for Eligible Hospitals and Critical Access Hospitals; Proposed Changes to Medicaid Provider Enrollment; and Proposed Changes to the Medicare Shared Savings Program

AGENCY: Centers for Medicare & Medicaid Services (CMS), HHS.

ACTION: Proposed rule.

SUMMARY: We are proposing to revise the Medicare hospital inpatient prospective payment systems (IPPS) for operating and capital-related costs of acute care hospitals to implement changes arising from our continuing experience with these systems for FY 2022 and to implement certain recent legislation. In addition, we are proposing to rebase and revise the hospital market baskets for acute care hospitals, update the labor-related share, and provide the market basket update that would apply to the rate-of-increase limits for certain hospitals excluded from the IPPS that are paid on a reasonable cost basis, subject to these limits for FY 2022. We are also proposing policies relating to Medicare graduate medical education (GME) for teaching hospitals to implement certain recent legislation. The proposed rule would also update the payment policies and the annual payment rates for the Medicare prospective payment system (PPS) for inpatient hospital services provided by long-term care hospitals (LTCHs) for FY 2022. In this FY 2022 IPPS/LTCH PPS proposed rule, we are proposing to extend New COVID–19 Treatments Add-on Payment (NCTAP) for certain eligible products through the end of the fiscal year in which the PHE ends and to discontinue the NCTAP for discharges on or after October 1, 2021 for a product that is approved for new technology add-on payments beginning FY 2022. We are also proposing to repeal the collection of market-based rate information on the Medicare cost report and the market-based MS–DRG relative weight methodology, as finalized in the FY 2021 IPPS/LTCH PPS final rule.

We are proposing to establish new requirements and revise existing requirements for eligible hospitals and critical access hospitals (CAHs) participating in the Medicare Promoting Interoperability Program. We are also providing estimated and newly established performance standards for the Hospital Value-Based Purchasing (VBP) Program, and proposing updated policies for the Hospital Readmissions Reduction Program, Hospital Inpatient Quality Reporting (IQR) Program, Hospital VBP Program, Hospital-Acquired Condition (HAC) Reduction Program, and the PPS-Exempt Cancer Hospital Reporting (PCHQR) Program, and the Long-Term Care Hospital Quality Reporting Program (LTCH QRP). Additionally, due to the impact of the COVID–19 PHE on measure data used in our value-based purchasing programs, we are proposing to suppress several measures in the Hospital VBP, HAC Reduction, and Hospital Readmissions Reduction Programs. In connection with our measure suppression proposals for the FY 2022 Hospital VBP Program, we are also proposing to revise the scoring and payment methodology for the FY 2022 program year such that hospitals will not be scored using quality measure data that are distorted by the effects of the COVID–19 public health emergency (PHE) and will not receive Total Performance Scores or adjustments to their payments as a result. Similarly, we are proposing to suppress affected measures for the FY 2022 HAC Reduction Program such that hospitals will not be scored using distorted quality measure data and will not receive Total HAC Scores based on those data. For the Hospital Readmissions Reduction Program, we are proposing to suppress one affected measure under the proposed measure suppression policy for the FY 2023 applicable period such that hospitals will not be assessed using distorted quality measure data and will not receive payment reductions based on those data.

In addition, we are proposing to change, clarify, and codify Medicare organ acquisition payment policies relative to organ procurement organizations (OPOs), transplant hospitals, and donor community hospitals. Also, we are proposing to add regulation requiring that state Medicaid agencies accept valid enrollments from all Medicare-enrolled providers and suppliers for purposes of processing claims for Medicare cost-sharing liability for services furnished to Medicare-Medicaid dually eligible individuals in order to alleviate a long-standing problem related to claiming Medicare bad debt.

Additionally, we are proposing to amend the Medicare Shared Savings Program regulations to allow eligible accountable care organizations (ACOs) participating in the BASIC track's glide path the opportunity to maintain their current level of participation for performance year (PY) 2022.

DATES: To be assured consideration, comments must be received at one of the addresses provided in the **ADDRESSES** section, no later than 5 p.m. EDT on June 28, 2021.

ADDRESSES: In commenting, please refer to file code CMS–1752–P. Because of staff and resource limitations, we cannot accept comments by facsimile (FAX) transmission.

Comments, including mass comment submissions, must be submitted in one of the following three ways (please choose only one of the ways listed):

1. *Electronically.* You may (and we encourage you to) submit electronic comments on this regulation to *http://www.regulations.gov*. Follow the instructions under the ''submit a comment'' tab.

2. *By regular mail.* You may mail written comments to the following address ONLY: Centers for Medicare & Medicaid Services, Department of Health and Human Services, Attention: CMS–1752–P, P.O. Box 8013, Baltimore, MD 21244–1850.

Please allow sufficient time for mailed comments to be received before the close of the comment period.

3. *By express or overnight mail.* You may send written comments via express or overnight mail to the following address ONLY: Centers for Medicare & Medicaid Services, Department of Health and Human Services, Attention: CMS–1752–P, Mail Stop C4–26–05, 7500 Security Boulevard, Baltimore, MD 21244–1850.

For information on viewing public comments, we refer readers to the beginning of the **SUPPLEMENTARY INFORMATION** section.

I. Executive Summary and Background

A. Executive Summary

1. Purpose and Legal Authority

This FY 2022 IPPS/LTCH PPS proposed rule would make payment and policy changes under the Medicare inpatient prospective payment systems (IPPS) for operating and capital-related costs of acute care hospitals as well as for certain hospitals and hospital units excluded from the IPPS. In addition, it would make payment and policy changes for inpatient hospital services

provided by long-term care hospitals (LTCHs) under the long-term care hospital prospective payment system (LTCH PPS). This proposed rule also would make policy changes to programs associated with Medicare IPPS hospitals, IPPS-excluded hospitals, and LTCHs. In this FY 2022 proposed rule, we are continuing policies to address wage index disparities impacting low wage index hospitals; including a proposal to implement the imputed floor wage index provision of the American Rescue Plan Act of 2021; including proposals related to new technology add-on payments; and proposing to repeal the collection of market-based rate information on the Medicare cost report and the market-based MS–DRG relative weight methodology, as finalized in the FY 2021 IPPS/LTCH PPS final rule. This proposed rule also includes proposals to implement provisions of the Consolidated Appropriations Act of 2021 relating to payments to hospitals for direct graduate medical education (GME) and indirect medical education (IME) costs.

We are proposing to establish new requirements and revise existing requirements for eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program.

We are providing estimated and newly established performance standards for the Hospital Value-Based Purchasing (VBP) Program, and proposing updated policies for the Hospital Readmissions Reduction Program, Hospital Inpatient Quality Reporting (IQR) Program, Hospital VBP Program, Hospital-Acquired Condition (HAC) Reduction Program, Long Term Care Hospital Quality Reporting Program (LTCH QRP), and the PPS-Exempt Cancer Hospital Reporting (PCHQR) Program. Additionally, due to the impact of the COVID–19 PHE on measure data used in our value-based purchasing programs, we are proposing to suppress several measures in the Hospital VBP, HAC Reduction, and Hospital Readmissions Reduction Programs. As a result of these measure suppressions for the Hospital VBP Program we are also proposing a special scoring methodology for FY 2022 that results in a value-based incentive payment amount that matches the 2 percent reduction to the base operating DRG payment amount.

Under various statutory authorities, we either discuss continued program implementation or are proposing to make changes to the Medicare IPPS, to the LTCH PPS, other related payment methodologies and programs for FY 2022 and subsequent fiscal years, and other policies and provisions included in this rule. These statutory authorities include, but are not limited to, the following:

- Section 1886(d) of the Social Security Act (the Act), which sets forth a system of payment for the operating costs of acute care hospital inpatient stays under Medicare Part A (Hospital Insurance) based on prospectively set rates. Section 1886(g) of the Act requires that, instead of paying for capital-related costs of inpatient hospital services on a reasonable cost basis, the Secretary use a prospective payment system (PPS).
- Section 1886(d)(1)(B) of the Act, which specifies that certain hospitals and hospital units are excluded from the IPPS. These hospitals and units are: Rehabilitation hospitals and units; LTCHs; psychiatric hospitals and units; children's hospitals; cancer hospitals; extended neoplastic disease care hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa). Religious nonmedical health care institutions (RNHCIs) are also excluded from the IPPS.
- Sections 123(a) and (c) of the BBRA (Public Law (Pub. L.) 106–113) and section 307(b)(1) of the BIPA (Pub. L. 106–554) (as codified under section 1886(m)(1) of the Act), which provide for the development and implementation of a prospective payment system for payment for inpatient hospital services of LTCHs described in section 1886(d)(1)(B)(iv) of the Act.
- Sections 1814(l), 1820, and 1834(g) of the Act, which specify that payments are made to critical access hospitals (CAHs) (that is, rural hospitals or facilities that meet certain statutory requirements) for inpatient and outpatient services and that these payments are generally based on 101 percent of reasonable cost.
- Section 1886(a)(4) of the Act, which specifies that costs of approved educational activities are excluded from the operating costs of inpatient hospital services. Hospitals with approved graduate medical education (GME) programs are paid for the direct costs of GME in accordance with section 1886(h) of the Act.
- Section 1886(b)(3)(B)(viii) of the Act, which requires the Secretary to reduce the applicable percentage increase that would otherwise apply to the standardized amount applicable to a subsection (d) hospital for discharges occurring in a fiscal year if the hospital does not submit data on measures in a form and manner, and at a time, specified by the Secretary.
- Section 1866(k) of the Act, which provides for the establishment of a quality reporting program for hospitals described in section 1886(d)(1)(B)(v) of the Act, referred to as ''PPS-exempt cancer hospitals.''
- Section 1886(o) of the Act, which requires the Secretary to establish a Hospital Value-Based Purchasing (VBP) Program, under which value-based incentive payments are made in a fiscal year to hospitals meeting performance standards established for a performance period for such fiscal year.
- Section 1886(p) of the Act, which establishes a Hospital-Acquired Condition (HAC) Reduction Program, under which payments to applicable hospitals are adjusted to provide an incentive to reduce hospital-acquired conditions.
- Section 1886(q) of the Act, as amended by section 15002 of the 21st Century Cures Act, which establishes the Hospital Readmissions Reduction Program. Under the program, payments for discharges from an applicable hospital as defined under section 1886(d) of the Act will be reduced to account for certain excess readmissions. Section 15002 of the 21st Century Cures Act directs the Secretary to compare hospitals with respect to the number of their Medicare-Medicaid dual-eligible beneficiaries (dual-eligibles) in determining the extent of excess readmissions.
- Section 1886(r) of the Act, as added by section 3133 of the Affordable Care Act, which provides for a reduction to disproportionate share hospital (DSH) payments under section 1886(d)(5)(F) of the Act and for a new uncompensated care payment to eligible hospitals. Specifically, section 1886(r) of the Act requires that, for fiscal year 2014 and each subsequent fiscal year, subsection (d) hospitals that would otherwise receive a DSH payment made under section 1886(d)(5)(F) of the Act will receive two separate payments: (1) 25 percent of the amount they previously would have received under section 1886(d)(5)(F) of the Act for DSH (''the empirically justified amount''), and (2) an additional payment for the DSH hospital's proportion of uncompensated care, determined as the product of three factors. These three factors are: (1) 75 percent of the payments that would otherwise be made under section 1886(d)(5)(F) of the Act; (2) 1 minus the percent change in the percent of individuals who are uninsured; and (3) a hospital's uncompensated care amount relative to the uncompensated

care amount of all DSH hospitals expressed as a percentage.

- Section 1886(m)(5) of the Act, which requires the Secretary to reduce by two percentage points the annual update to the standard Federal rate for discharges for a long-term care hospital (LTCH) during the rate year for LTCHs that do not submit data in the form, manner, and at a time, specified by the Secretary.
- Section 1886(m)(6) of the Act, as added by section 1206(a)(1) of the Pathway for Sustainable Growth Rate (SGR) Reform Act of 2013 (Pub. L. 113–67) and amended by section 51005(a) of the Bipartisan Budget Act of 2018 (Pub. L. 115–123), which provided for the establishment of site neutral payment rate criteria under the LTCH PPS, with implementation beginning in FY 2016. Section 51005(b) of the Bipartisan Budget Act of 2018 amended section 1886(m)(6)(B) by adding new clause (iv), which specifies that the IPPS comparable amount defined in clause (ii)(I) shall be reduced by 4.6 percent for FYs 2018 through 2026.
- Section 1899B of the Act, as added by section 2(a) of the Improving Medicare Post-Acute Care Transformation Act of 2014 (IMPACT Act) (Pub. L. 113–185), which provides for the establishment of standardized data reporting for certain post-acute care providers, including LTCHs.
- Section 1899 of the Act which established the Medicare Shared Savings Program (Shared Savings Program) to facilitate coordination and cooperation among providers and suppliers to improve the quality of care for Medicare fee-for-service (FFS) beneficiaries and reduce the rate of growth in expenditures under Medicare Parts A and B.
- Section 1902(a)(23) of the Act, which specifies Medicaid provider enrollment requirements. States may set reasonable standards relating to the qualifications of providers but may not restrict the right of beneficiaries to obtain services from any person or entity that is both qualified and willing to furnish such services.

2. Summary of the Major Provisions

The following is a summary of the major provisions in this proposed rule. In general, these major provisions are being proposed as part of the annual update to the payment policies and payment rates, consistent with the applicable statutory provisions. A general summary of the proposed changes in this proposed rule is presented in section I.D. of the preamble of this proposed rule.

a. Proposed MS–DRG Documentation and Coding Adjustment

Section 631 of the American Taxpayer Relief Act of 2012 (ATRA, Pub. L. 112–240) amended section 7(b)(1)(B) of Public Law 110–90 to require the Secretary to make a recoupment adjustment to the standardized amount of Medicare payments to acute care hospitals to account for changes in MS–DRG documentation and coding that do not reflect real changes in case-mix, totaling $11 billion over a 4-year period of FYs 2014, 2015, 2016, and 2017. The FY 2014 through FY 2017 adjustments represented the amount of the increase in aggregate payments as a result of not completing the prospective adjustment authorized under section 7(b)(1)(A) of Public Law 110–90 until FY 2013. Prior to the ATRA, this amount could not have been recovered under Public Law 110 90. Section 414 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10) replaced the single positive adjustment we intended to make in FY 2018 with a 0.5 percent positive adjustment to the standardized amount of Medicare payments to acute care hospitals for FYs 2018 through 2023. (The FY 2018 adjustment was subsequently adjusted to 0.4588 percent by section 15005 of the 21st Century Cures Act.) Therefore, for FY 2022, we are proposing to make an adjustment of +0.5 percent to the standardized amount.

b. Proposed Changes to the New COVID–19 Treatments Add-On Payment (NCTAP)

In response to the COVID–19 PHE, we established the New COVID–19 Treatments Add-on Payment (NCTAP) under the IPPS for COVID–19 cases that meet certain criteria (85 FR 71157 and 71158). We believe that as drugs and biological products become available and are authorized for emergency use or approved by Food and Drug Administration (FDA) for the treatment of COVID–19 in the inpatient setting, it is appropriate to increase the current IPPS payment amounts to mitigate any potential financial disincentives for hospitals to provide new COVID–19 treatments during the PHE. Therefore, effective for discharges occurring on or after November 2, 2020 and until the end of the PHE for COVID–19, CMS established the NCTAP.

We anticipate that there might be inpatient cases of COVID–19, beyond the end of the PHE, for which payment based on the assigned MS–DRG may not adequately reflect the additional cost of new COVID–19 treatments. In order to continue to mitigate potential financial disincentives for hospitals to provide these new treatments, and to minimize any potential payment disruption immediately following the end of the PHE, we believe that the NCTAP should remain available for cases involving eligible treatments for the remainder of the fiscal year in which the PHE ends (for example, until September 30, 2022). At the same time, we also believe that any new technology add-on payments that may be approved for a COVID–19 treatment would also serve to mitigate any potential financial disincentives for hospitals to provide that new COVID–19 treatment, such that the NCTAP would no longer be needed for that same product.

Therefore, we are proposing to extend NCTAP for eligible products that are not approved for new technology add-on payments through the end of the fiscal year in which the PHE ends (for example, September 30, 2022). We also are proposing to discontinue the NCTAP for discharges on or after October 1, 2021 for a product that is approved for new technology add-on payments beginning FY 2022.

c. Use of FY 2020 or FY 2019 Data in the FY 2022 IPPS and LTCH PPS Ratesetting

For the IPPS and LTCH PPS ratesetting, our longstanding goal is always to use the best available data overall. In section I.F. of the preamble of this proposed rule we discuss our analysis of the best available data for use in the development of this FY 2022 IPPS/LTCH PPS proposed rule given the potential impact of the public health emergency (PHE) for the Coronavirus Disease (COVID–19). As discussed in section I.F of the preamble of this proposed rule, we are proposing to use the FY 2019 data, such as the FY 2019 MedPAR file, for the FY 2022 ratesetting for circumstances where the FY 2020 data is significantly impacted by the COVID–19 PHE, primarily in that the utilization of inpatient services reflect generally markedly different utilization for certain types of services in FY 2020 than would have been expected in the absence of the PHE. In section I.O. of Appendix A of this proposed rule, we are also considering, as an alternative to this proposal, the use of the same FY 2020 data that we would ordinarily use for purposes of FY 2022 ratesetting, and which we may consider finalizing based on consideration of comments received.

d. Proposed Continuation of the Low Wage Index Hospital Policy

To help mitigate wage index disparities between high wage and low hospitals, in the FY 2020 IPPS/LTCH

PPS rule (84 FR 42326 through 42332), we adopted a policy to increase the wage index values for certain hospitals with low wage index values (the low wage index hospital policy). This policy was adopted in a budget neutral manner through an adjustment applied to the standardized amounts for all hospitals. We also indicated that this policy would be effective for at least 4 years, beginning in FY 2020, in order to allow employee compensation increases implemented by these hospitals sufficient time to be reflected in the wage index calculation. Therefore, for FY 2022, we are continuing the low wage index hospital policy, and are also proposing to apply this policy in a budget neutral manner by applying an adjustment to the standardized amounts.

e. Proposed Implementation of Section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2) Imputed Floor Wage Index Policy for All-Urban States

Section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2) amended section 1886(d)(3)(E) of the Act (42 U.S.C. 1395ww(d)(3)(E)) to establish a minimum area wage index for hospitals in all-urban States. Specifically, section 1886(d)(3)(E)(iv) of the Act (as added by section 9831(a)(2) of Pub. L. 117–2) reinstates the imputed floor wage index policy for all-urban states effective for discharges on or after October 1, 2021 (FY 2022) with no expiration date using the methodology described in 42 CFR 412.64(h)(4)(vi) as in effect for FY 2018. Furthermore, section 1886(d)(3)(E)(iv)(III) of the Act provides that the imputed floor wage index shall not be applied in a budget neutral manner. We refer readers to section III.G.2. of this proposed rule for a summary of the provisions of section 9831 of Public Law 117–2 that we are proposing to implement in this proposed rule.

f. Proposed DSH Payment Adjustment and Additional Payment for Uncompensated Care

Section 3133 of the Affordable Care Act modified the Medicare disproportionate share hospital (DSH) payment methodology beginning in FY 2014. Under section 1886(r) of the Act, which was added by section 3133 of the Affordable Care Act, starting in FY 2014, FY 2014, Medicare DSHs receive 25 percent of the amount they previously would have received under the statutory formula for Medicare DSH payments in section 1886(d)(5)(F) of the Act. The remaining amount, equal to 75 percent of the amount that otherwise would have been paid as Medicare DSH payments, is paid as additional payments after the amount is reduced for changes in the percentage of individuals that are uninsured. Each Medicare DSH will receive an additional payment based on its share of the total amount of uncompensated care for all Medicare DSHs for a given time period.

In this proposed rule, we are proposing to update our estimates of the three factors used to determine uncompensated care payments for FY 2022. We are also proposing to continue to use uninsured estimates produced by CMS' Office of the Actuary (OACT) as part of the development of the National Health Expenditure Accounts (NHEA) in the calculation of Factor 2. Consistent with the policy adopted in the FY 2021 IPPS/LTCH PPS final rule for FY 2022 and subsequent fiscal years, we are using a single year of data on uncompensated care costs from Worksheet S–10 of the FY 2018 cost reports to calculate Factor 3 in the FY 2022 methodology for all eligible hospitals with the exception of Indian Health Service (IHS) and Tribal hospitals and Puerto Rico hospitals. For IHS and Tribal hospitals and Puerto Rico hospitals we are proposing to continue to use the low-income insured days proxy to calculate Factor 3 for these hospitals for FY 2022. We are proposing certain methodological changes for calculating Factor 3 for FY 2022.

Additionally, we are proposing to revise our regulation governing the calculation of the Medicaid fraction of the DSH calculation. Under this proposal, patient days of individuals receiving benefits under a section 1115 waiver program would be counted in the numerator of the Medicaid fraction only if the patient directly receives inpatient hospital insurance coverage on that day under a waiver authorized under section 1115(a)(2) of the Act.

g. Reduction of Hospital Payments for Excess Readmissions

We are proposing to make changes to policies for the Hospital Readmissions Reduction Program, which was established under section 1886(q) of the Act, as amended by section 15002 of the 21st Century Cures Act. The Hospital Readmissions Reduction Program requires a reduction to a hospital's base operating DRG payment to account for excess readmissions of selected applicable conditions. For FY 2017 and subsequent years, the reduction is based on a hospital's risk-adjusted readmission rate during a 3-year period for acute myocardial infarction (AMI), heart failure (HF), pneumonia, chronic obstructive pulmonary disease (COPD), elective primary total hip arthroplasty/total knee arthroplasty (THA/TKA), and coronary artery bypass graft (CABG) surgery. In this FY 2022 IPPS/LTCH PPS proposed rule, we are proposing the following policies: (1) To adopt a cross-program measure suppression policy; (2) to suppress the Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) following Pneumonia Hospitalization measure (NQF #0506) for the FY 2023 program year; (3) to modify the remaining five condition-specific readmission measures to exclude COVID–19 diagnosed patients from the measure denominators, beginning with the FY 2023 program year; (4) to use the MedPAR data that aligns with the applicable period for FY 2022; (5) to automatically adopt the use of MedPAR data corresponding to the applicable period beginning with the FY 2023 program year and all subsequent program years, unless otherwise specified by the Secretary; and (6) to update the regulatory text to reflect that our Hospital Compare website has been renamed and is now referred to as Care Compare. We are clarifying our Extraordinary Circumstances Exceptions (ECE) policy, and we are also requesting public comment on opportunities to advance health equity through possible future stratification of results by race and ethnicity for condition/procedure-specific readmission measures and by expansion of standardized data collection to additional social factors, such as language preference and disability status. We are also seeking comment on mechanisms of incorporating other demographic characteristics into analyses that address and advance health equity, such as the potential to include administrative and self-reported data to measure co-occurring disability status.

h. Hospital Value-Based Purchasing (VBP) Program

Section 1886(o) of the Act requires the Secretary to establish a Hospital VBP Program under which value-based incentive payments are made in a fiscal year to hospitals based on their performance on measures established for a performance period for such fiscal year. In this proposed rule, we are proposing to: (1) Establish a measure suppression policy for the duration of the public health emergency for COVID–19; (2) suppress the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS), Medicare Spending Per Beneficiary (MSPB), and five Healthcare-Associated Infection (HAI) measures, for the FY 2022 Program year; and (3) suppress the Hospital 30-Day,

All-Cause, Risk-Standardized Mortality Rate Following Pneumonia (PN) Hospitalization (MORT–30–PN) measure for the FY 2023 program year. We are also proposing to revise the scoring and payment methodology for the FY 2022 program year such that hospitals' Total Performance Scores will not include calculations based on these measures. We believe that awarding a TPS to any hospital based off the remaining measures that are not suppressed would not result in a fair national comparison and, as a result, are proposing not to award a TPS to any hospital for the FY 2022 program year. Instead, we are proposing to award each hospital a payment incentive multiplier that results in a value-based incentive payment that is equal to the amount withheld for the fiscal year (2 percent). We are proposing to remove the CMS Patient Safety and Adverse Events Composite (PSI 90) measure beginning with FY 2023 because the costs associated with the measure outweigh the benefit of its use in the program. We are also proposing to update the baseline periods for certain measures affected by the ECE granted in response to the COVID–19 PHE and to make a technical update to our terminology used in the Hospital VBP Program regulations.

i. Hospital-Acquired Condition (HAC) Reduction Program

Section 1886(p) of the Act establishes an incentive to hospitals to reduce the incidence of hospital-acquired conditions by requiring the Secretary to make an adjustment to payments to applicable hospitals, effective for discharges beginning on October 1, 2014. This 1-percent payment reduction applies to hospitals that rank in the worst-performing quartile (25 percent) of all applicable hospitals, relative to the national average, of conditions acquired during the applicable period and on all of the hospital's discharges for the specified fiscal year. In this FY 2022 IPPS/LTCH PPS proposed rule, we are proposing to: (1) Clarify our ECE policy; (2) adopt a cross-program measure suppression policy; (3) apply that measure suppression policy to suppress certain program data; and (4) update the regulatory text to reflect that our *Hospital Compare* website has been renamed and is now referred to as *Care Compare.*

j. Hospital Inpatient Quality Reporting (IQR) Program

Under section 1886(b)(3)(B)(viii) of the Act, subsection (d) hospitals are required to report data on measures selected by the Secretary for a fiscal year in order to receive the full annual percentage increase that would otherwise apply to the standardized amount applicable to discharges occurring in that fiscal year.

In this FY 2022 IPPS/LTCH PPS proposed rule, we are proposing to make several changes. We are proposing to adopt five new measures: (1) A new structural measure—Maternal Morbidity Structural Measure—beginning with a shortened reporting period from October 1, 2021 through December 31, 2021 affecting the CY 2021 reporting period/FY 2023 payment determination; (2) the Hybrid Hospital-Wide All-Cause Risk Standardized Mortality (Hybrid HWM) measure in a stepwise fashion, beginning with a voluntary reporting period from July 1, 2022 through June 30, 2023, and followed by mandatory reporting from July 1, 2023 through June 30, 2024, affecting the FY 2026 payment determination and for subsequent years; (3) the COVID–19 Vaccination Coverage Among Health Care Personnel (HCP) measure beginning with a shortened reporting period from October 1, 2021 through December 31, 2021, affecting the CY 2021 reporting period/FY 2023 payment determination and with quarterly reporting beginning with the FY 2024 payment determination and for subsequent years; and two medication-related adverse event eCQMs beginning with the CY 2023 reporting period/FY 2025 payment determination; (4) Hospital Harm-Severe Hypoglycemia eCQM (NQF #3503e); and (5) Hospital Harm-Severe Hyperglycemia eCQM (NQF #3533e).

We are also proposing to remove five measures: (1) Death Among Surgical Inpatients with Serious Treatable Complications (CMS PSI–04) beginning with the FY 2023 payment determination; (2) Exclusive Breast Milk Feeding (PC–05) (NQF #0480) beginning with the FY 2026 payment determination; (3) Admit Decision Time to ED Departure Time for Admitted Patients (ED–2) (NQF #0497) beginning with the FY 2026 payment determination; and two stroke-related eCQMs beginning with the FY 2026 payment determination; (4) Anticoagulation Therapy for Atrial Fibrillation/Flutter eCQM (STK–03) (NQF #0436); and (5) Discharged on Statin Medication eCQM (STK–06) (NQF #0439).

We are requesting comment from stakeholders on the potential future development and inclusion of two measures: (1) A mortality measure for patients admitted with COVID–19; and (2) a patient-reported outcomes measure following elective total hip and/or total knee arthroplasty (THA/TKA). We are also requesting comment from stakeholders on ways we can leverage measures to address gaps in existing health equity generally as well as comment on: (1) Potential future confidential stratified reporting for the Hospital-Wide All-Cause Unplanned Readmission (HWR) measure using both dual eligibility and race/ethnicity; and (2) potential future reporting of a structural measure to assess the degree of hospital leadership engagement in health equity performance data. In this proposed rule, we are also requesting feedback across programs on potential actions and priority areas that would enable the continued transformation of our quality measurement toward greater digital capture of data and use of the FHIR standard.

In addition, beginning with the CY 2023 reporting period/FY 2025 payment determination, we are proposing to require hospitals to use certified technology that has been updated consistent with the 2015 Edition Cures Update and clarifying that certified technology must support the reporting requirements for all available eCQMs. We also are proposing that hybrid measures comply with the same certification requirements as eCQMs, specifically that EHR technology must be certified to the 2015 Edition Cures Update. We are proposing an update to revise 42 CFR 412.140(a)(2) and 42 CFR 412.140(e)(2)(iii) replacing the terms ''Security Administrator'' and ''System Administrator'' with the term ''security official'' in alignment with other CMS quality programs. Due to an updated URL for the QualityNet website from *QualityNet.org* to *QualityNet.cms.gov*, we are also proposing to revise Hospital IQR Program regulations at 42 CFR 412.140(a)(1) and 42 CFR 412.140(c)(2)(i) to reflect updates to the QualityNet website. Lastly, we are proposing to extend the effects of the educational review process for chart-abstracted measures beginning with validations affecting the FY 2024 payment determination.

k. PPS-Exempt Cancer Hospital Quality Reporting Program

Section 1866(k)(1) of the Act requires, for purposes of FY 2014 and each subsequent fiscal year, that a hospital described in section 1886(d)(1)(B)(v) of the Act (a PPS-exempt cancer hospital, or a PCH) submit data in accordance with section 1866(k)(2) of the Act with respect to such fiscal year. There is no financial impact to PCH Medicare payment if a PCH does not participate.

In this proposed rule, we are proposing to remove the Oncology: Plan of Care for Pain—Medical Oncology and

Radiation Oncology (NQF #0383) (PCH–15) measure beginning with the FY 2024 program year, adopt the COVID–19 Vaccination Coverage Among Healthcare Personnel measure beginning with the FY 2023 program year, make a technical update to the terminology we use in the program, and codify existing PCHQR Program policies in our regulations.

l. Medicare Promoting Interoperability Program

For purposes of reducing the burden on eligible hospitals and CAHs, we are proposing several changes to the Medicare Promoting Interoperability Program. Specifically, we are proposing: (1) To continue the EHR reporting period of a minimum of any continuous 90-day period for new and returning eligible hospitals and CAHs for CY 2023 and to increase the EHR reporting period to a minimum of any continuous 180-day period for new and returning eligible hospitals and CAHs for CY 2024; (2) to maintain the Electronic Prescribing Objective's Query of PDMP measure as optional while increasing its available bonus from five points to 10 points for the EHR reporting period in CY 2022; (3) to modify the Provide Patient's Electronic Access to Their Health Information measure to establish a data availability requirement beginning with encounters with a date of service on or after January 1, 2016, beginning with the EHR reporting period in CY 2022; (4) to add a new Health Information Exchange (HIE) Bi-Directional Exchange measure as a yes/no attestation, to the HIE objective as an optional alternative to the two existing measures beginning with the EHR reporting period in CY 2022; (5) to require reporting a ''yes'' on four of the existing Public Health and Clinical Data Exchange Objective measures (Syndromic Surveillance Reporting, Immunization Registry Reporting, Electronic Case Reporting, and Electronic Reportable Laboratory Result Reporting) or requesting the applicable exclusion(s); (6) adding a new measure to the Protect Patient Health Information objective that requires eligible hospitals and CAHs to attest to having completed an annual assessment of SAFER Guides beginning with the EHR reporting period in CY 2022; (7) to remove attestation statements 2 and 3 from the Promoting Interoperability Program's prevention of information blocking requirement; (8) to increase the minimum required score for the objectives and measures from 50 points to 60 points (out of 100 points) in order to be considered a meaningful EHR user; and (9) to adopt two new eCQMs to the Medicare Promoting Interoperability Program's eCQM measure set beginning with the reporting period in CY 2023, in addition to removing four eCQMs from the measure set beginning with the reporting period in CY 2024 which is in alignment with the proposals for the Hospital IQR Program. We are amending our regulation texts as necessary to incorporate several of these proposed changes.

m. Proposed Repeal of Market-Based Data Collection and Market-Based MS–DRG Relative Weight Methodology

As discussed in section V.L. of the preamble of this proposed rule, we are proposing to repeal the requirement that a hospital report on the Medicare cost report the median payer-specific negotiated charge that the hospital has negotiated with all of its MA organization payers, by MS–DRG, for cost reporting periods ending on or after January 1, 2021. We are also proposing to repeal the market-based MS–DRG relative weight methodology adopted for calculating the MS–DRG relative weights effective in FY 2024, and to continue using the existing cost-based methodology for calculating the MS–DRG relative weights for FY 2024 and subsequent fiscal years. Lastly, we are soliciting comment on alternative approaches or data sources that could be used in Medicare fee-for-service (FFS) ratesetting. The proposed repeal of these policies would result in a reduction of 63,780 annual burden hours for all hospitals.

n. Proposed Implementation of Sections 126, 127 and 131 of the Consolidated Appropriations Act (CAA) of 2021

In this proposed rule, we are including proposals to implement sections 126, 127 and 131 of the Consolidated Appropriations Act (CAA) of 2021. Section 126(a) of the CAA amended section 1886(h) of the Act by adding a new section 1886(h)(9) of the Act requiring the distribution of additional residency positions to qualifying hospitals. Section 127 of the CAA amended section 1886(h)(4)(H)(iv) of the Act to specify that in the case of a hospital not located in a rural area that established or establishes a medical residency training program (or rural track) in a rural area, the hospital, and each such hospital located in a rural area that participates in such a training, is allowed to receive an adjustment to its full-time equivalent (FTE) resident limit. Section 131 of the CAA amended section 1886(h)(2)(F) of the Act to provide an opportunity to hospitals with such extremely low or $0 per resident amounts (PRAs) that meet certain criteria to reset and establish new PRAs if the hospital trains resident(s) in a cost reporting period beginning on or after enactment [December 27, 2020] and before the date that is 5 years after enactment [December 26, 2025]. Section 131 also amended section 1886(h)(4)(H)(i) of the Act to provide an opportunity for hospitals that meet certain criteria and that have very small FTE resident caps to replace those caps if the Secretary determines the hospital begins training residents in a new program beginning on or after enactment (December 27, 2020) and before 5 years after enactment (December 26, 2025). We refer readers to section V.J.2. of this proposed rule for rule for a summary of the provisions of sections 126, 127, and 131 of the CAA that we are proposing to implement in this proposed rule.

o. Proposed Changes to Organ Acquisition Payment Policy

In section X.B.2.h. of the preamble of this proposed rule, we are proposing to revise and codify the Medicare usable organ counting policy to count only organs transplanted into Medicare beneficiaries so that Medicare more accurately records and pays its share of organ acquisition costs.

p. Medicare Shared Savings Program

We are proposing to make changes to policies for the Shared Savings Program, which was established under section 1899 of the Act, to allow eligible ACOs participating in the BASIC track's glide path the option to elect to forgo automatic advancement along the glide path's increasing levels of risk and potential reward for performance year (PY) 2022. Under this proposal, prior to the automatic advancement for PY 2022, an eligible ACO may elect to remain in the same level of the BASIC track's glide path in which it participated during PY 2021. For PY 2023, an ACO that elects this advancement deferral option would be automatically advanced to the level of the BASIC track's glide path in which it would have participated during PY 2023 if it had advanced automatically to the required level for PY 2022 (unless the ACO elects to advance more quickly before the start of PY 2023).

3. Summary of Costs and Benefits

The following table provides a summary of the costs, savings, benefits associated with the major provisions described in section I.A.3. of the preamble of this proposed rule.

BILLING CODE 4120–01–P

Provision Description	Description of Costs, Transfers, Savings, and Benefits
Proposed Adjustment for MS-DRG Documentation and Coding Changes	Section 414 of the MACRA replaced the single positive adjustment we intended to make in FY 2018 once the recoupment required by section 631 of the ATRA was complete with a 0.5 percentage point positive adjustment to the standardized amount of Medicare payments to acute care hospitals for FYs 2018 through 2023. (The FY 2018 adjustment was subsequently adjusted to 0.4588 percentage point by section 15005 of the 21st Century Cures Act.) For FY 2022, we are proposing to make an adjustment of +0.5 percentage point to the standardized amount consistent with the MACRA.
Proposed Changes to the New COVID-19 Treatments Add-on Payment	In response to the COVID-19 PHE, CMS established the New COVID-19 Treatments Add-on Payment (NCTAP) under the IPPS for COVID-19 cases that meet certain criteria (85 FR 71155). We anticipate inpatient cases of COVID-19 beyond the end of the PHE for which payment based on the assigned MS-DRG may not adequately reflect the additional cost of new COVID-19 treatments. In order to continue to mitigate potential financial disincentives for hospitals to provide these new treatments, and to minimize any potential payment disruption immediately following the end of the PHE, we believe that the NCTAP should remain available for cases involving eligible treatments for the remainder of the fiscal year in which the PHE ends (for example, until September 30, 2022). At the same time, we also believe that any new technology add-on payments that may be approved for a COVID-19 treatment would also serve to mitigate any potential financial disincentives for hospitals to provide that new COVID-19 treatment, such that the NCTAP would no longer be needed for that same product. Therefore, we are proposing to extend the NCTAP for eligible products that are not approved for new technology add-on payments through the end of the fiscal year in which the PHE ends (for example, until September 30, 2022). We also are proposing to discontinue the NCTAP for discharges on or after October 1, 2021 for a product that is approved for new technology add-on payments beginning FY 2022. On one extreme, if all of the new COVID–19 treatments decrease the net cost of hospitalizations (for example, due to shortened lengths of stay), including the cost of the new treatment, below the Medicare payment for discharges after the end of the PHE and through the end of the fiscal year in which the PHE ends, then there would be no NCTAP made and no additional cost to the Medicare program as a result of this proposed extension. On the other extreme, if all of the new COVID–19 treatments result in the net cost of hospitalizations that exceed the outlier threshold (for example, due to the cost of the new treatment) for discharges after the end of the PHE and through the end of the fiscal year in which the PHE ends, the cost to the Medicare program would be the sum over all such NCTAP cases of 0.65 times the outlier threshold for each case. Given it is unknown

Provision Description	Description of Costs, Transfers, Savings, and Benefits
	what the cost and utilization of inpatient stays using these new treatments will be, this proposal is a cost but is not estimable. Therefore, it is not possible to quantify the impact of the proposed extension of the NCTAP.
Proposed Implementation of Section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2) Imputed Floor Wage Index Policy for All-Urban States	As discussed in section III.G.2. of the preamble of this proposed rule, we are proposing to implement section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2) which reinstates the imputed floor wage index policy for all-urban states effective for discharges on or after October 1, 2021 (FY 2022) with no expiration date using the methodology described in 42 CFR 412.64(h)(4)(vi) as in effect for FY 2018. Furthermore, section 1886(d)(3)(E)(iv)(III) of the Act (as added by section 9831(a)(2) of the American Rescue Plan Act of 2021) provides that the imputed floor wage index shall not be applied in a budget neutral manner. We estimate that our proposed implementation of section 9831 of the American Rescue Plan Act of 2021 would result in an estimated cost of approximately $0.2 billion for FY 2022.
Medicare DSH Payment Adjustment and Additional Payment for Uncompensated Care	For FY 2022, we are proposing to update our estimates of the three factors used to determine uncompensated care payments. We are proposing to continue to use uninsured estimates produced by OACT as part of the development of the NHEA in conjunction with more recently available data that takes into consideration the effects of the COVID-19 pandemic in the calculation of Factor 2. Consistent with the policy adopted in the FY 2021 IPPS/LTCH PPS final rule for FY 2022 and subsequent fiscal years, we are using a single year of data on uncompensated care costs from Worksheet S–10 for FY 2018 to determine Factor 3 for FY 2022 for all eligible hospitals with the exception of Indian Health Service (IHS) and Tribal hospitals and Puerto Rico hospitals. To determine the amount of uncompensated care for purposes of calculating Factor 3 for Puerto Rico hospitals and Indian Health Service and Tribal hospitals, we are proposing to continue to use data regarding low-income insured days for FY 2013. We project that the amount available to distribute as payments for uncompensated care for FY 2022 will decrease by approximately $662 million, as compared to our estimate of the uncompensated care payments that will be distributed in FY 2021. The uncompensated care payments have redistributive effects, based on a hospital's uncompensated care amount relative to the uncompensated care amount for all hospitals that are projected to be eligible to receive Medicare DSH payments, and the calculated payment amount is not directly tied to a hospital's number of discharges. Additionally, we are proposing to revise our regulation governing the calculation of the Medicaid fraction of the DSH calculation. Under this proposal, patient days of individuals receiving benefits under a section 1115 waiver program would be counted in the numerator of the Medicaid fraction only if the patient directly receives inpatient hospital insurance coverage on that day under a waiver authorized under section 1115(a)(2) of the Act. To the extent that this proposal has an impact on expenditures, that impact is not estimable because we do not have information on the number of section 1115 days by hospital which could be included in the Medicaid fraction absent the proposed revision to the regulation, which would be required to make an estimate.
Update to the IPPS Payment Rates and Other Payment Policies	As discussed in Appendix A of this proposed rule, acute care hospitals are estimated to experience an increase of approximately $2.507 billion in FY 2022, including operating, capital, and new technology changes, as well as increased GME payments as a result of section 131 of the Consolidated Appropriations Act of 2021 and increased payments as a result of the imputed floor provision in section 9831 of the American Rescue Plan Act of 2021, as modeled for this proposed rule.

Provision Description	Description of Costs, Transfers, Savings, and Benefits
Update to the LTCH PPS Payment Rates and Other Payment Policies	As discussed in Appendix A of this proposed rule, based on the best available data for the 363 LTCHs in our database, we estimate that the proposed changes to the payment rates and factors that we present in the preamble of and Addendum to this proposed rule, which reflect the proposed update to the LTCH PPS standard Federal payment rate for FY 2022, would result in an estimated increase in payments in FY 2022 of approximately $52 million.
Proposed Changes to the Hospital Readmissions Reduction Program	For FY 2021 and subsequent years, DRG reductions in payments are based on a hospital's risk-adjusted readmission rate during a 3-year period for acute myocardial infarction (AMI), heart failure (HF), pneumonia, chronic obstructive pulmonary disease (COPD), elective primary total hip arthroplasty/total knee arthroplasty (THA/TKA), and coronary artery bypass graft (CABG) surgery. Overall, in this proposed rule, we estimate that 2,545 hospitals would have their base operating DRG payments reduced by their determined proxy FY 2022 hospital-specific readmission adjustment. As a result, we estimate that the Hospital Readmissions Reduction Program would save approximately $553 million in FY 2022.
Value-Based Incentive Payments under the Hospital VBP Program	We estimate that there would be no net financial impact to the Hospital VBP Program for the FY 2022 program year in the aggregate because, by law, the amount available for value-based incentive payments under the program in a given year must be equal to the total amount of base operating MS-DRG payment amount reductions for that year, as estimated by the Secretary. The estimated amount of base operating MS-DRG payment amount reductions for the FY 2022 program year and, therefore, the estimated amount available for value-based incentive payments for FY 2022 discharges is approximately $1.9 billion.
Proposed Changes to the HAC Reduction Program	A hospital's Total HAC Score and its ranking in comparison to other hospitals in any given year depend on several different factors. We are making no changes to the scoring methodology, which will continue to use the Winsorized z-score and equal measure weights approaches to determine the worst-performing quartile of hospitals. Any significant impact due to the HAC Reduction Program changes for FY 2022, including which hospitals will receive the adjustment, will depend on the actual experience of hospitals in the Program. For example, a hospital with poor performance during CY 2020 may move out of the worst-performing quartile status (that is, not receive a payment reduction) due to the proposed measure suppression policy. In turn, this would lead to another hospital moving into the worst-performing quartile status. In a typical year, approximately 18 percent of hospitals experience a change in worst-performing quartile status from one year to the next. Preliminary analysis indicates a reduction in the percentage of hospitals experiencing a change in worst-performing quartile status due to the proposed measure suppression policy. We refer readers to section IX.I.7.a.(3).c.
Proposed Changes to the Hospital Inpatient Quality Reporting (IQR) Program	Across 3,300 IPPS hospitals, we estimate that our proposed changes for the Hospital IQR Program in this proposed rule would result in a total information collection burden increase of 2,475 hours associated with our proposed policies and updated burden estimates and a total cost increase of approximately $101,475 across a 4-year period from the CY 2022 reporting period/FY 2024 payment determination through the CY 2025 reporting period/FY 2027 payment determination.
Changes to the Medicare and Promoting Interoperability Program	Based on updated wage rates for 2019 from the Bureau of Labor Statistics, and an amended hourly staff usage from that of a lawyer to a medical records and health information technician role, we estimate that the proposed changes would result in a decrease of $607,893 for the annual information collection burden (total cost) in CY 2022.

Provision Description	Description of Costs, Transfers, Savings, and Benefits
Proposed Implementation of Sections 126, 127, and 131 of the Consolidated Appropriations Act (CAA) of 2021	Section 1886(h) of the Act, as amended by sections 126, 127, and 131 of the CAA of 2021 (Pub. L. 116-260), provides for the distribution of additional residency positions (section 126), promotes a rural hospital GME funding opportunity (section 127), and requires resetting PRAs and FTE resident caps for certain hospitals after hosting medical resident rotators for short durations (section 131). We refer readers to section V.X.2. of this proposed rule for a summary of the provisions of sections 126, 127 and 131 that we are proposing to implement in this proposed rule. We estimate that the proposal that we present in the preamble of this proposed rule to implement section 126 of the CAA would result in an estimated cost of approximately $1.830 billion from FY 2023 through FY 2031. We estimate that the proposal that we present in the preamble of this proposed rule to implement section 127 of the CAA would result in an estimated cost of approximately $0.130 billion from FY 2024 through FY 2031. We estimate that the proposal that we present in the preamble of this proposed rule to implement section 131 of the CAA would result in an estimated cost of approximately $1.380 billion from FY 2022 through FY 2031.
Market-Based MS-DRG Relative Weight Policy – Proposed Repeal	In section V.L. of the preamble of this proposed rule, we are proposing to repeal the requirement that hospitals report on the Medicare cost report the median payer-specific negotiated charge that the hospital has negotiated with all of its MA organization payers, by MS-DRG, for cost reporting periods ending on or after January 1, 2021. We are also proposing to repeal the market-based MS-DRG relative weight methodology adopted for calculating the MS-DRG relative weights effective in FY 2024. We previously estimated total annual burden hours for this policy are as follows: 3,189 hospitals times 20 hours per hospital equals 63,780 annual burden hours and $4,315,993. Therefore, a repeal of this policy would result in a reduction of 63,780 annual burden hours for all hospitals. We refer readers to section XI.B.11. of the preamble of this proposed rule for further analysis of this assessment.
Proposed Changes to Organ Acquisition Payment Policy	In section X.B.2.h. of the preamble of this proposed rule, we are proposing to revise and codify the Medicare usable organ counting policy to count only organs transplanted into Medicare beneficiaries so that Medicare more accurately records and pays its share of organ acquisition costs. We estimate a cost savings to the Medicare trust fund of $230 million in FY 2022, $1.74 billion over 5 years, and $4.150 billion over 10 years. We refer readers to section X.B.2.h. for further analysis of this assessment.
Changes to the Medicare Shared Savings Program	In section I.H.12 of the Appendix A of this proposed rule, we describe the estimated impacts of our proposed changes to the Shared Savings Program to extend the flexibility for eligible ACOs to elect to "freeze" their participation level along the BASIC track's glide path for PY 2022. The net effect of offering this flexibility is estimated to be a $90 million reduction in Federal spending, with the reduction ranging from $50 to $140 million.

BILLING CODE 4120–01–C

B. Background Summary

1. Acute Care Hospital Inpatient Prospective Payment System (IPPS)

Section 1886(d) of the Act sets forth a system of payment for the operating costs of acute care hospital inpatient stays under Medicare Part A (Hospital Insurance) based on prospectively set rates. Section 1886(g) of the Act requires the Secretary to use a prospective payment system (PPS) to pay for the capital-related costs of inpatient hospital services for these ''subsection (d) hospitals.'' Under these PPSs, Medicare payment for hospital inpatient operating and capital-related costs is made at predetermined, specific rates for each hospital discharge. Discharges are classified according to a list of diagnosis-related groups (DRGs).

The base payment rate is comprised of a standardized amount that is divided into a labor-related share and a nonlabor-related share. The labor-related share is adjusted by the wage index applicable to the area where the hospital is located. If the hospital is located in Alaska or Hawaii, the nonlabor-related share is adjusted by a cost-of-living adjustment factor. This base payment rate is multiplied by the DRG relative weight.

If the hospital treats a high percentage of certain low-income patients, it receives a percentage add-on payment applied to the DRG-adjusted base payment rate. This add-on payment, known as the disproportionate share hospital (DSH) adjustment, provides for a percentage increase in Medicare payments to hospitals that qualify under either of two statutory formulas designed to identify hospitals that serve a disproportionate share of low-income patients. For qualifying hospitals, the amount of this adjustment varies based on the outcome of the statutory calculations. The Affordable Care Act revised the Medicare DSH payment methodology and provides for a new additional Medicare payment beginning on October 1, 2013, that considers the amount of uncompensated care furnished by the hospital relative to all other qualifying hospitals.

If the hospital is training residents in an approved residency program(s), it receives a percentage add-on payment for each case paid under the IPPS, known as the indirect medical education (IME) adjustment. This percentage varies, depending on the ratio of residents to beds.

Additional payments may be made for cases that involve new technologies or medical services that have been approved for special add-on payments. In general, to qualify, a new technology or medical service must demonstrate that it is a substantial clinical improvement over technologies or services otherwise available, and that, absent an add-on payment, it would be inadequately paid under the regular DRG payment. In addition, certain transformative new devices and certain antimicrobial products may qualify under an alternative inpatient new technology add-on payment pathway by demonstrating that, absent an add-on payment, they would be inadequately paid under the regular DRG payment.

The costs incurred by the hospital for a case are evaluated to determine whether the hospital is eligible for an additional payment as an outlier case. This additional payment is designed to protect the hospital from large financial losses due to unusually expensive cases. Any eligible outlier payment is added to the DRG-adjusted base payment rate, plus any DSH, IME, and new technology or medical service add-on adjustments.

Although payments to most hospitals under the IPPS are made on the basis of the standardized amounts, some categories of hospitals are paid in whole or in part based on their hospital-specific rate, which is determined from their costs in a base year. For example, sole community hospitals (SCHs) receive the higher of a hospital-specific rate based on their costs in a base year (the highest of FY 1982, FY 1987, FY 1996, or FY 2006) or the IPPS Federal rate based on the standardized amount. SCHs are the sole source of care in their areas. Specifically, section 1886(d)(5)(D)(iii) of the Act defines an SCH as a hospital that is located more than 35 road miles from another hospital or that, by reason of factors such as an isolated location, weather conditions, travel conditions, or absence of other like hospitals (as determined by the Secretary), is the sole source of hospital inpatient services reasonably available to Medicare beneficiaries. In addition, certain rural hospitals previously designated by the Secretary as essential access community hospitals are considered SCHs.

Under current law, the Medicare-dependent, small rural hospital (MDH) program is effective through FY 2022. For discharges occurring on or after October 1, 2007, but before October 1, 2022, an MDH receives the higher of the Federal rate or the Federal rate plus 75 percent of the amount by which the Federal rate is exceeded by the highest of its FY 1982, FY 1987, or FY 2002 hospital-specific rate. MDHs are a major source of care for Medicare beneficiaries in their areas. Section 1886(d)(5)(G)(iv) of the Act defines an MDH as a hospital that is located in a rural area (or, as amended by the Bipartisan Budget Act of 2018, a hospital located in a State with no rural area that meets certain statutory criteria), has not more than 100 beds, is not an SCH, and has a high percentage of Medicare discharges (not less than 60 percent of its inpatient days or discharges in its cost reporting year beginning in FY 1987 or in two of its three most recently settled Medicare cost reporting years).

Section 1886(g) of the Act requires the Secretary to pay for the capital-related costs of inpatient hospital services in accordance with a prospective payment system established by the Secretary. The basic methodology for determining capital prospective payments is set forth in our regulations at 42 CFR 412.308 and 412.312. Under the capital IPPS, payments are adjusted by the same DRG for the case as they are under the operating IPPS. Capital IPPS payments are also adjusted for IME and DSH, similar to the adjustments made under the operating IPPS. In addition, hospitals may receive outlier payments for those cases that have unusually high costs.

The existing regulations governing payments to hospitals under the IPPS are located in 42 CFR part 412, subparts A through M.

2. Hospitals and Hospital Units Excluded From the IPPS

Under section 1886(d)(1)(B) of the Act, as amended, certain hospitals and hospital units are excluded from the IPPS. These hospitals and units are: Inpatient rehabilitation facility (IRF) hospitals and units; long-term care hospitals (LTCHs); psychiatric hospitals and units; children's hospitals; cancer hospitals; extended neoplastic disease care hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa). Religious nonmedical health care institutions (RNHCIs) are also excluded from the IPPS. Various sections of the Balanced Budget Act of 1997 (BBA) (Pub. L. 105–33), the Medicare, Medicaid and SCHIP [State Children's Health Insurance Program] Balanced Budget Refinement Act of 1999 (BBRA, Pub. L. 106–113), and the Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act of 2000 (BIPA, Pub. L. 106–554) provide for the implementation of PPSs for IRF hospitals and units, LTCHs, and psychiatric hospitals and units (referred to as inpatient psychiatric facilities (IPFs)). (We note that the annual

updates to the LTCH PPS are included along with the IPPS annual update in this document. Updates to the IRF PPS and IPF PPS are issued as separate documents.) Children's hospitals, cancer hospitals, hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa), and RNHCIs continue to be paid solely under a reasonable cost-based system, subject to a rate-of-increase ceiling on inpatient operating costs. Similarly, extended neoplastic disease care hospitals are paid on a reasonable cost basis, subject to a rate-of-increase ceiling on inpatient operating costs.

The existing regulations governing payments to excluded hospitals and hospital units are located in 42 CFR parts 412 and 413.

3. Long-Term Care Hospital Prospective Payment System (LTCH PPS)

The Medicare prospective payment system (PPS) for LTCHs applies to hospitals described in section 1886(d)(1)(B)(iv) of the Act, effective for cost reporting periods beginning on or after October 1, 2002. The LTCH PPS was established under the authority of sections 123 of the BBRA and section 307(b) of the BIPA (as codified under section 1886(m)(1) of the Act). Section 1206(a) of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67) established the site neutral payment rate under the LTCH PPS, which made the LTCH PPS a dual rate payment system beginning in FY 2016. Under this statute, effective for LTCH's cost reporting periods beginning in FY 2016 cost reporting period, LTCHs are generally paid for discharges at the site neutral payment rate unless the discharge meets the patient criteria for payment at the LTCH PPS standard Federal payment rate. The existing regulations governing payment under the LTCH PPS are located in 42 CFR part 412, subpart O. Beginning October 1, 2009, we issue the annual updates to the LTCH PPS in the same documents that update the IPPS.

4. Critical Access Hospitals (CAHs)

Under sections 1814(l), 1820, and 1834(g) of the Act, payments made to critical access hospitals (CAHs) (that is, rural hospitals or facilities that meet certain statutory requirements) for inpatient and outpatient services are generally based on 101 percent of reasonable cost. Reasonable cost is determined under the provisions of section 1861(v) of the Act and existing regulations under 42 CFR part 413.

5. Payments for Graduate Medical Education (GME)

Under section 1886(a)(4) of the Act, costs of approved educational activities are excluded from the operating costs of inpatient hospital services. Hospitals with approved graduate medical education (GME) programs are paid for the direct costs of GME in accordance with section 1886(h) of the Act. The amount of payment for direct GME costs for a cost reporting period is based on the hospital's number of residents in that period and the hospital's costs per resident in a base year. The existing regulations governing payments to the various types of hospitals are located in 42 CFR part 413.

C. Summary of Provisions of Recent Legislation That Would Be Implemented in This Proposed Rule

1. The Medicare Access and CHIP Reauthorization Act of 2015 (Pub. L. 114–10)

Section 414 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA, Pub. L. 114–10) specifies a 0.5 percent positive adjustment to the standardized amount of Medicare payments to acute care hospitals for FYs 2018 through 2023. These adjustments follow the recoupment adjustment to the standardized amounts under section 1886(d) of the Act based upon the Secretary's estimates for discharges occurring from FYs 2014 through 2017 to fully offset $11 billion, in accordance with section 631 of the ATRA. The FY 2018 adjustment was subsequently adjusted to 0.4588 percent by section 15005 of the 21st Century Cures Act.

2. Consolidated Appropriations Act, 2021 (Pub. L. 116–260)

Sections 126, 127 and 131 of the Consolidated Appropriations Act, 2021 made a number of changes to various sections of the Act relating to payment for direct GME and IME costs to hospitals.

a. Section 126 of the Consolidated Appropriations Act, 2021

Section 126 amended section 1886(h) of the Act by adding a new section 1886(h)(9) requiring the distribution of additional residency positions to qualifying hospitals. Section 1886(h)(9)(A) requires that for FY 2023, and for each succeeding fiscal year until the aggregate number of full-time equivalent residency positions distributed is equal to 1,000, the Secretary shall initiate separate rounds of applications from hospitals for these additional residency positions. The Secretary is required, subject to certain provisions in the law, to increase the otherwise applicable resident limit for each qualifying hospital that submits a timely application by the number of positions that may be approved by the Secretary for that hospital. The Secretary is required to notify hospitals of the number of positions distributed to them by January 31 of the fiscal year of the increase, and the increase is effective beginning July 1 of that fiscal year. Section 1886(h)(9)(A) also limits the aggregate number of such positions made available in a single fiscal year across all hospitals to no more than 200.

In determining the qualifying hospitals for which an increase is provided, section 1886(h)(9)(B) requires the Secretary to take into account the demonstrated likelihood of the hospital filling the positions made available within the first 5 training years beginning after the date the increase would be effective, as determined by the Secretary.

Section 1886(h)(9)(B) of the Act also requires a minimum distribution for certain categories of hospitals. Specifically, the Secretary is required to distribute at least 10 percent of the aggregate number of total residency positions available to each of four categories of hospitals. Stated briefly, and discussed in greater detail in later in this proposed rule, the categories are as follows: (1) Hospitals located in rural areas or that are treated as being located in a rural area; (2) hospitals in which the reference resident level of the hospital is greater than the otherwise applicable resident limit; (3) hospitals in states with new medical schools or additional locations and branches of existing medical schools; and (4) hospitals that serve areas designated as Health Professional Shortage Areas (HPSAs). Additionally, section 1886(h)(9)(F)(ii) of the Act defines a qualifying hospital as a hospital in one of these four categories.

Section 1886(h)(9)(C) of the Act places certain limitations on the distribution of the residency positions. First, a hospital may not receive more than 25 additional full-time equivalent residency positions. Second, no increase in the otherwise applicable resident limit of a hospital may be made unless the hospital agrees to increase the total number of full-time equivalent residency positions under the approved medical residency training program of the hospital by the number of positions made available to that hospital.

b. Section 127 of the Consolidated Appropriations Act, 2021

Section 127 of the CAA amended section 1886(h)(4)(H)(iv) of the Act to

specify that in the case of a hospital not located in a rural area that established or establishes a medical residency training program (or rural tracks) in a rural area, the hospital, and each such hospital located in a rural areas that participates in such a training, is allowed to receive an adjustment to its full-time equivalent (FTE) resident limit.

c. Sections 131 of the Consolidated Appropriations Act, 2021

Section 131 of the CAA amended section 1886(h)(2)(F) of the Act to provide an opportunity to hospitals with such extremely low or $0 per resident amounts (PRAs) that meet certain criteria to reset and establish new PRAs if the hospital trains resident(s) in a cost reporting period beginning on or after enactment [December 27, 2020] and before the date that is 5 years after enactment [December 26, 2025]. Section 131 of the CAA also amended section 1886(h)(4)(H)(i) of the Act to provide an opportunity for hospitals that meet certain criteria and that have very small FTE resident caps to replace those caps if the Secretary determines the hospital begins training residents in a program year beginning on or after enactment (December 27, 2020) and before 5 years after enactment (December 26, 2025).

D. Summary of the Provisions of This Proposed Rule

In this proposed rule, we set forth proposed payment and policy changes to the Medicare IPPS for FY 2022 operating costs and capital-related costs of acute care hospitals and certain hospitals and hospital units that are excluded from IPPS. In addition, we set forth proposed changes to the payment rates, factors, and other payment and policy-related changes to programs associated with payment rate policies under the LTCH PPS for FY 2022.

The following is a general summary of the changes that we are proposing to make in this proposed rule.

1. Proposed Changes to MS–DRG Classifications and Recalibrations of Relative Weights

In section II. of the preamble of this proposed rule, we include—

- Proposed changes to MS–DRG classifications based on our yearly review for FY 2022.
- Proposed adjustment to the standardized amounts under section 1886(d) of the Act for FY 2022 in accordance with the amendments made to section 7(b)(1)(B) of Public Law 110–90 by section 414 of the MACRA.
- Proposed recalibration of the MS–DRG relative weights.
- A discussion of the proposed FY 2022 status of new technologies approved for add-on payments for FY 2022, a presentation of our evaluation and analysis of the FY 2022 applicants for add-on payments for high-cost new medical services and technologies (including public input, as directed by Public Law 108–173, obtained in a town hall meeting) for applications not submitted under an alternative pathway, and a discussion of the proposed status of FY 2022 new technology applicants under the alternative pathways for certain medical devices and certain antimicrobial products.
- A proposal to extend the New COVID–19 Treatments Add-on Payment (NCTAP) through the end of the fiscal year in which the PHE ends for certain products and discontinue NCTAP for products approved for new technology add-on payments in FY 2022.

2. Proposed Changes to the Hospital Wage Index for Acute Care Hospitals

In section III. of the preamble of this proposed rule we are proposing to make revisions to the wage index for acute care hospitals and the annual update of the wage data. Specific issues addressed include, but were not limited to, the following:

- The proposed FY 2022 wage index update using wage data from cost reporting periods beginning in FY 2018.
- Calculation, analysis, and implementation of the proposed occupational mix adjustment to the wage index for acute care hospitals for FY 2022 based on the 2019 Occupational Mix Survey.
- Proposed application of the rural floor and the frontier State floor, and continuation of the low wage index hospital policy.
- Proposed implementation of the imputed floor wage index policy for all-urban states under section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2).
- Proposed revisions to the wage index for acute care hospitals, based on hospital redesignations and reclassifications under sections 1886(d)(8)(B), (d)(8)(E), and (d)(10) of the Act.
- Proposed revisions to the regulations at § 412.278 regarding the Administrator's Review of MGCRB decisions.
- Proposed changes to rural reclassification cancellation requirements at § 412.103(g).
- Proposed adjustment to the wage index for acute care hospitals for FY 2022 based on commuting patterns of hospital employees who reside in a county and work in a different area with a higher wage index.
- Proposed labor-related share for the proposed FY 2022 wage index.

3. Proposed Rebasing and Revising of the Hospital Market Baskets

In section IV. of the preamble of this proposed rule, we are proposing to rebase and revise the hospital market baskets for acute care hospitals and update the labor-related share.

4. Other Decisions and Proposed Changes to the IPPS for Operating Costs

In section V. of the preamble of this proposed rule, we discuss proposed changes or clarifications of a number of the provisions of the regulations in 42 CFR parts 412 and 413, including the following:

- Proposed inpatient hospital update for FY 2022.
- Proposed updated national and regional case-mix values and discharges for purposes of determining RRC status.
- The statutorily required IME adjustment factor for FY 2022.
- Proposed changes to the methodologies for determining Medicare DSH payments and the additional payments for uncompensated care.
- Proposed requirements for payment adjustments under the Hospital Readmissions Reduction Program for FY 2022.
- The provision of estimated and newly established performance standards for the calculation of value-based incentive payments, as well as a proposal to suppress multiple measures and provide net-neutral payment adjustments under the Hospital Value-Based Purchasing Program.
- Proposed requirements for payment adjustments to hospitals under the HAC Reduction Program for FY 2022.
- Discussion of and proposed changes relating to the implementation of the Rural Community Hospital Demonstration Program in FY 2022.
- Proposed revisions to the regulations regarding the counting of days associated with section 1115 demonstration projects in the Medicaid fraction.
- Proposals to implement provisions of the Consolidated Appropriations Act relating to payments to hospitals for direct graduate medical education (GME) and indirect medical education (IME) costs.
- Proposed repeal of the market-based data collection requirement and market-based MS–DRG relative weight methodology.

5. Proposed FY 2022 Policy Governing the IPPS for Capital-Related Costs

In section VI. of the preamble to this proposed rule, we discuss the proposed payment policy requirements for capital-related costs and capital payments to hospitals for FY 2022.

6. Proposed Changes to the Payment Rates for Certain Excluded Hospitals: Rate-of-Increase Percentages

In section VII. of the preamble of this proposed rule, we discuss—

- Proposed changes to payments to certain excluded hospitals for FY 2022.
- Proposed continued implementation of the Frontier Community Health Integration Project (FCHIP) Demonstration.

7. Proposed Changes to the LTCH PPS

In section VIII. of the preamble of this proposed rule, we set forth proposed changes to the LTCH PPS Federal payment rates, factors, and other payment rate policies under the LTCH PPS for FY 2022.

8. Proposed Changes Relating to Quality Data Reporting for Specific Providers and Suppliers

In section IX. of the preamble of this proposed rule, we address the following:

- Proposed requirements for the Hospital Inpatient Quality Reporting (IQR) Program.
- Proposed changes to the requirements for the quality reporting program for PPS-exempt cancer hospitals (PCHQR Program).
- Proposed changes to the requirements under the LTCH Quality Reporting Program (QRP). We are also seeking information on CMS's future plans to define digital quality measures (dQMs) for the LTCH QRP and on CMS' continued efforts to close the health equity gap.
- Proposed changes to requirements pertaining to eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program.

9. Other Proposals Included in This Proposed Rule

Section X. of the preamble to this proposed rule includes the following proposals:

- Proposed changes pertaining to Medicaid enrollment of Medicare-enrolled providers and suppliers to 42 CFR part 455.410 and request for comment on provider experiences where state Medicaid agencies apply the Medicaid payment and coverage rules to a claim for a Medicare service rather than adjudicating the claim for Medicare cost-sharing liability.
- Proposed changes pertaining to Medicare's share of organ acquisition costs transplanted into Medicare beneficiaries and the charges for services provided to cadaveric organ donors by donor community hospitals and transplants hospitals.
- Proposed changes pertaining to the Shared Savings Program that would allow eligible ACOs participating in the BASIC track's glide path to maintain their current level of participation for PY 2022.

10. Other Provisions of This Proposed Rule

Section XI. of the preamble to this proposed rule includes our discussion of the MedPAC Recommendations.

Section XII. of the preamble to this proposed rule includes the following:

- A descriptive listing of the public use files associated with the proposed rule.
- The collection of information requirements for entities based on our proposals.
- Information regarding our responses to public comments.

11. Determining Prospective Payment Operating and Capital Rates and Rate-of-Increase Limits for Acute Care Hospitals

In sections II. and III. of the Addendum to this proposed rule, we set forth proposed changes to the amounts and factors for determining the proposed FY 2022 prospective payment rates for operating costs and capital-related costs for acute care hospitals. We proposed to establish the threshold amounts for outlier cases. In addition, in section IV. of the Addendum to this proposed rule, we address the proposed update factors for determining the rate-of-increase limits for cost reporting periods beginning in FY 2022 for certain hospitals excluded from the IPPS.

12. Determining Prospective Payment Rates for LTCHs

In section V. of the Addendum to the proposed rule, we set forth proposed changes to the amounts and factors for determining the proposed FY 2022 LTCH PPS standard Federal payment rate and other factors used to determine LTCH PPS payments under both the LTCH PPS standard Federal payment rate and the site neutral payment rate in FY 2022. We are proposing to establish the adjustments for the wage index, labor-related share, the cost-of-living adjustment, and high-cost outliers, including the applicable fixed-loss amounts and the LTCH cost-to-charge ratios (CCRs) for both payment rates.

13. Impact Analysis

In Appendix A of the proposed rule, we set forth an analysis of the impact the proposed changes would have on affected acute care hospitals, CAHs, LTCHs, PCHs and other entities.

14. Recommendation of Update Factors for Operating Cost Rates of Payment for Hospital Inpatient Services

In Appendix B of the proposed rule, as required by sections 1886(e)(4) and (e)(5) of the Act, we provide our recommendations of the appropriate percentage changes for FY 2022 for the following:

- A single average standardized amount for all areas for hospital inpatient services paid under the IPPS for operating costs of acute care hospitals (and hospital-specific rates applicable to SCHs and MDHs).
- Target rate-of-increase limits to the allowable operating costs of hospital inpatient services furnished by certain hospitals excluded from the IPPS.
- The LTCH PPS standard Federal payment rate and the site neutral payment rate for hospital inpatient services provided for LTCH PPS discharges.

15. Discussion of Medicare Payment Advisory Commission Recommendations

Under section 1805(b) of the Act, MedPAC is required to submit a report to Congress, no later than March 15 of each year, in which MedPAC reviews and makes recommendations on Medicare payment policies. MedPAC's March 2021 recommendations concerning hospital inpatient payment policies address the update factor for hospital inpatient operating costs and capital-related costs for hospitals under the IPPS. We address these recommendations in Appendix B of this proposed rule. For further information relating specifically to the MedPAC March 2021 report or to obtain a copy of the report, contact MedPAC at (202) 220–3700 or visit MedPAC's website at: *http://www.medpac.gov*.

E. Advancing Health Information Exchange

The Department of Health and Human Services (HHS) has a number of initiatives designed to encourage and support the adoption of interoperable health information technology and to promote nationwide health information exchange to improve health care and patient access to their health information.

To further interoperability in post-acute care settings, CMS and the Office of the National Coordinator for Health

Information Technology (ONC) participate inin the Post-Acute Care Interoperability Workgroup (PACIO *http://pacioproject.org/*) to facilitate collaboration with industry stakeholders to develop FHIR standards. These standards could support the exchange and reuse of patient assessment data derived from the Minimum Data Set (MDS), Inpatient Rehabilitation Facility-Patient Assessment Instrument (IRF–PAI), LTCH Continuity Assessment Record and Evaluation (CARE Data Set (LCDS), Outcome and Assessment Information Set (OASIS), and other sources. The PACIO Project has focused on FHIR implementation guides for functional status, cognitive status and new use cases on advance directives and speech language pathology. We encourage post-acute care (PAC) provider and health information technology (IT) vendor participation as the efforts advance.

The CMS Data Element Library (DEL) continues to be updated and serves as the authoritative resource for PAC assessment data elements and their associated mappings to health IT standards, such as Logical Observation Identifiers Names and Codes (LOINC) and Systematized Nomenclature of Medicine Clinical Terms (SNOMED). The DEL furthers CMS' goal of data standardization and interoperability. These interoperable data elements can reduce provider burden by allowing the use and exchange of healthcare data; supporting provider exchange of electronic health information for care coordination, person-centered care; and supporting real-time, data driven, clinical decision-making. Standards in the Data Element Library (*https://del.cms.gov/DELWeb/pubHome*)can be referenced on the CMS website and in the ONC Interoperability Standards Advisory (ISA). The 2021 ISA is available at *https://www.healthit.gov/isa*.

The 21st Century Cures Act (Cures Act) (Pub. L. 114–255, enacted December 13, 2016) requires HHS to take new steps to enable the electronic sharing of health information ensuring interoperability for providers and settings across the care continuum. The Cures Act includes a trusted exchange framework and common agreement (TEFCA) provision [1] that will enable the nationwide exchange of electronic health information across health information networks and provide an important way to enable bi-directional health information exchange in the future. For more information on current developments related to TEFCA, we refer readers to *https://www.healthit.gov/topic/interoperability/trusted-exchange-framework-and-common-agreement* and *https://rce.sequoiaproject.org/*.

The ONC final rule entitled ''21st Century Cures Act: Interoperability, Information Blocking, and the ONC Health IT Certification Program'' (85 FR 25642) published in the May 1, 2020 **Federal Register**, (hereinafter referred to as ''ONC Cures Act Final Rule'') implemented policies related to information blocking as authorized under section 4004 of the 21st Century Cures Act. Information blocking is generally defined as a practice by a health IT developer of certified health IT, health information network, health information exchange, or health care provider that, except as required by law or specified by the HHS Secretary as a reasonable and necessary activity, is likely to interfere with access, exchange, or use of electronic health information. For a health care provider (as defined in 45 CFR 171.102), the definition of information blocking (see 45 CFR 171.103) specifies that the provider knows that the practice is unreasonable, as well as likely to interfere with access, exchange, or use of electronic health information.[2] To deter information blocking, health IT developers of certified health IT, health information networks and health information exchanges whom the HHS Inspector General determines, following an investigation, have committed information blocking, are subject to civil monetary penalties of up to $1 million per violation. Appropriate disincentives for health care providers need to be established by the Secretary through rulemaking. Stakeholders can learn more about information blocking at *https://www.healthit.gov/curesrule/final-rule-policy/information-blocking*. ONC has posted information resources including fact sheets (*https://www.healthit.gov/curesrule/resources/fact-sheets*), frequently asked questions (*https://www.healthit.gov/curesrule/resources/information-blocking-faqs*), and recorded webinars (*https://www.healthit.gov/curesrule/resources/webinars*).

We invite providers to learn more about these important developments and how they are likely to affect LTCHs.

F. Use of FY 2020 or FY 2019 Data in the FY 2022 IPPS and LTCH PPS Ratesetting

We primarily use two data sources in the IPPS and LTCH PPS ratesetting: Claims data and cost report data. The claims data source is the MedPAR file, which includes fully coded diagnostic and procedure data for all Medicare inpatient hospital bills for discharges in a fiscal year. Our goal is always to use the best available data overall for ratesetting. Ordinarily, the best available MedPAR data would be the most recent MedPAR file that contains claims from discharges for the fiscal year that is 2 years prior to the fiscal year that is the subject of the rulemaking. For FY 2022 ratesetting, under ordinary circumstances, the best available data would be the FY 2020 MedPAR file. The cost report data source is the Medicare hospital cost report data files from the most recent quarterly HCRIS release. For example, ordinarily, the best available cost report data used in relative weight calculations would be based on the cost reports beginning 3 fiscal years prior to the fiscal year that is the subject of the rulemaking. For the FY 2022 ratesetting, under ordinary circumstances, that would be the FY 2019 cost report data from HCRIS, which would contain many cost reports ending in FY 2020 based on each hospital's cost reporting period.

The FY 2020 MedPAR claims file and the FY 2019 HCRIS dataset both contain data significantly impacted by the COVID–19 PHE, primarily in that the utilization of inpatient services was generally markedly different for certain types of services in FY 2020 than would have been expected in the absence of the PHE, as we discuss in this section. Accordingly, we question whether these data sources are the best available data to use for the FY 2022 ratesetting. One factor in assessing whether these data sources represent the best available data is to what extent the FY 2019 data from before the COVID–19 PHE is a better overall approximation of FY 2022 inpatient experience (for example, whether the share of total inpatient utilization for elective surgeries will be more similar to FY 2019 than to FY 2020), or alternatively, to what extent the FY 2020 data which include the COVID–19 PHE time period is a better overall approximation of FY 2022 inpatient experience (for example, whether the share of total inpatient utilization for respiratory infections will be more similar to FY 2020 than to FY

[1] ONC, *Draft 2 Trusted Exchange Framework and Common Agreement, https://www.healthit.gov/sites/default/files/page/2019-04/FINALTEFCAQTF41719508version.pdf*.

[2] For other types of actors (health IT developers of certified health IT and health information network or health information exchange, as defined in 45 CFR 171.102), the definition of ''information blocking'' (see 45 CFR 171.103) specifies that the actor ''knows, or should know, that such practice is likely to interfere with access, exchange, or use of electronic health information.''

2019). Another factor is to what extent the decision to use the FY 2019 or FY 2020 data differentially impacts the FY 2022 IPPS ratesetting.

In order to help assess likely inpatient utilization in FY 2022, we examined the trend in the number of COVID–19 vaccinations in the United States as reported to the Centers for Disease Control (CDC) (see *https://www.cdc.gov/coronavirus/2019-ncov/covid-data/covidview/index.html*, accessed April 16, 2021).

The U.S. COVID–19 Vaccination Program began December 14, 2020. As of April 15, 2021, 198.3 million vaccine doses have been administered. Overall, about 125.8 million people, or 37.9 percent of the U.S. population, have received at least one dose of vaccine as of this date. About 78.5 million people, or 23.6 percent of the U.S. population have been fully vaccinated.[3] As of April 15, the 7-day average number of administered vaccine doses reported to CDC per day was 3.3 million, a 10.3 percent increase from the previous week. As of April 15, 80 percent of people 65 or older have received at least one dose of vaccine; 63.7 percent are fully vaccinated. Nearly one-half (48.3 percent) of people 18 or older have received at least one dose of vaccine; 30.3 percent are fully vaccinated. Nationally, COVID–19-related emergency department visits as well as both hospital admissions and current hospitalizations have risen among patients ages 18 to 64 years in recent weeks, but emergency department visits and hospitalizations among people ages 65 years and older have decreased, likely demonstrating the important role vaccination plays in protecting against COVID–19.

As indicated by the CDC, COVID–19 vaccines are effective at preventing COVID–19.[4] For example, a recent CDC report on the effectiveness of the Pfizer-BioNTech and Moderna COVID–19 vaccines when administered in real-world conditions found that after being fully vaccinated with either of these vaccines a person's risk of infection is reduced by up to 90 percent. With respect to inpatient utilization in FY 2020, we believe that COVID–19 and the risk of disease were drivers of the different utilization patterns observed. Therefore, the continuing rapid increase in vaccinations coupled with the overall effectiveness of the vaccines leads us to conclude based on the information available to us at this time that there will be significantly lower risk of COVID–19 in FY 2022 and fewer hospitalizations for COVID–19 for Medicare beneficiaries in FY 2022 than there were in FY 2020. This calls into question the applicability of inpatient data from FY 2020 to the FY 2022 time period for hospitals paid under the IPPS and LTCH PPS.

We also reviewed CDC guidance to healthcare facilities during the COVID–19 PHE (see *https://www.cdc.gov/coronavirus/2019-ncov/hcp/guidance-hcf.html*). In its most recent guidance, the CDC described how the COVID–19 pandemic has changed how health care is delivered in the United States and has affected the operations of healthcare facilities. Effects cited by the CDC include increases in patients seeking care for respiratory illnesses, patients deferring and delaying non-COVID–19 care, disruptions in supply chains, fluctuations in facilities' occupancy, absenteeism among staff because of illness or caregiving responsibilities, and increases in mental health concerns.

In order to investigate the effects cited by the CDC, we examined the claims data from the FY 2020 MedPAR compared to the FY 2019 MedPAR. Overall, in FY 2020, inpatient admissions under the IPPS dropped by approximately 14 percent compared to FY 2019. Elective surgeries declined significantly, and the share of admissions for MS–DRGs associated with the treatment of COVID–19 increased. For example, the number of inpatient admissions for MS–DRG 470 (Major Hip and Knee Joint Replacement or Reattachment of Lower Extremity without MCC) dropped by 40 percent in FY 2020. Its share of inpatient admissions dropped from 4.0 percent in FY 2019 to 2.8 percent in FY 2020. The number of inpatient admissions for MS–DRG 177 (Respiratory Infections and Inflammations with MCC) increased by +133 percent. Its share of inpatient admissions increased from 0.8 percent in FY 2019 to 2.2 percent in FY 2020. This data analysis is consistent with the observations in the CDC's guidance that COVID–19 increased the number of patients seeking care for respiratory illnesses, and caused patients to defer and delay non-COVID–19 care. We note that these observed changes in the claims data also extend to the cost reports submitted by hospitals that include the COVID–19 PHE time period, since those cost reports that extend into the COVID–19 PHE are based in part on the discharges that occurred during that time.

The effects noted by the CDC are specific to the pandemic and to the extent that the effects on healthcare facilities noted by the CDC are not expected to continue into FY 2022, it would suggest that the inpatient data from FY 2020 impacted by the COVID–19 PHE may be less suitable for use in the FY 2022 ratesetting.

We also considered the analysis of 2020 IPPS real case-mix included in the notice titled ''CY 2021 Inpatient Hospital Deductible and Hospital and Extended Care Services Coinsurance Amounts'' that appeared in the **Federal Register** on November 12, 2020 (85 FR 71916). Section 1813(b) of the Act prescribes the method for computing the amount of the inpatient hospital deductible. The inpatient hospital deductible is an amount equal to the inpatient hospital deductible for the preceding CY, adjusted by the best estimate of the payment-weighted average of the applicable percentage increases used for updating the payment rates to hospitals, and adjusted to reflect changes in real case-mix.

To develop the adjustment to reflect changes in real case-mix, we first calculated an average case-mix for each hospital that reflected the relative costliness of that hospital's mix of cases compared to those of other hospitals. We then computed the change in average case-mix for hospitals paid under the IPPS in FY 2020 compared to FY 2019, using Medicare bills from IPPS hospitals received as of July 2020. Those bills represented a total of about 6.1 million Medicare discharges for FY 2020 and provided the most recent case-mix data available at the time of that analysis. Based on these bills, the change in average case-mix in FY 2020 was 2.8 percent. Based on these bills and past experience, we expected the overall case-mix change to be 3.8 percent as the year progressed and more FY 2020 data became available.

Real case-mix is that portion of case-mix that is due to changes in the mix of cases in the hospital and not due to coding optimization. As stated in the November 2020 notice, COVID–19 has complicated the determination of real case-mix increase. COVID–19 cases typically group to higher-weighted MS–DRGs, and hospitals have experienced a concurrent reduction in cases that group

[3] People who are fully vaccinated (formerly receiving 2 doses) represents the number of people who have received the second dose in a two-dose COVID–19 vaccine series or one dose of the single-dose J&J/Janssen COVID–19 vaccine.

[4] Interim Estimates of Vaccine Effectiveness of BNT162b2 and mRNA–1273 COVID–19 Vaccines in Preventing SARS–CoV–2 Infection Among Health Care Personnel, First Responders, and Other Essential and Frontline Workers—Eight U.S. Locations, December 2020–March 2021, available at *https://www.cdc.gov/mmwr/volumes/70/wr/mm7013e3.htm?s_cid=mm7013e3_e&ACSTrackingID=USCDC_921-DM53321&ACSTrackingLabel=MMWR%20Early%20Release%20-%20Vol.%2070%2C%20March%2029%2C%202021&deliveryName=USCDC_921-DM53321*, accessed April 2, 2021).

to lower weighted MS–DRGs. Both of these factors cause a real increase in case-mix. We compared the average case-mix for February 2020 through July 2020 (COVID–19 period) with average case-mix for October 2019 through January 2020 (pre-COVID–19 period). Since this increase applies for only a portion of CY 2020, we allocated this increase by the estimated discharges over the 2 periods—a 2.5 percent increase for FY 2020. The 1.3-percent residual case-mix increase is a mixture of real case-mix and coding optimization. Over the past several years, we have observed total case-mix increases of about 0.5 percent per year and have assumed that they are real. Thus, based on the information available, we expect that 0.5 percent of the residual 1.3 percent change in average case-mix for FY 2020 will be real. The combination of the 2.5 percent COVID–19 effect and the remaining residual 0.5-percent real case-mix increase results in an estimated 3.0 percent increase in real case-mix for FY 2020.

Because this analysis was based on Medicare bills from IPPS hospitals received as of July 2020, for this proposed rule, we calculated case-mix values for FY 2019 and FY 2020 based on the full year FY 2019 and FY 2020 MedPAR files to help assess the change in case-mix based on more complete data. For FY 2019 we calculated a case-mix value of 1.813 and for FY 2020 we calculated a case-mix value of 1.883, an increase in total case-mix of 3.9 percent. These were calculated using the MS–DRG relative weights in effect for those time periods.[5] This is consistent with the estimate in the Notice of the CY 2021 Inpatient Hospital Deductible and Hospital and Extended Care Services Coinsurance Amounts that the change in total case-mix for FY 2020 would be 3.8 percent when more complete data was available.

The increases in patients seeking care for respiratory illnesses and patients deferring and delaying non-COVID–19 care during FY 2020, the increasing number of vaccinations for COVID–19, and the high estimate of FY 2020 real case-mix growth all lead us to believe that FY 2020 is not the best overall approximation of inpatient experience in FY 2022. We believe that FY 2019 as the most recent complete FY prior to the COVID–19 PHE is a better approximation of FY 2022 inpatient experience.

As we indicated earlier, whether the data is a better overall approximation of FY 2022 inpatient experience is one factor in assessing which data source represents the best available data for the FY 2022 rulemaking. Another factor is to what extent the decision to use the FY 2019 or FY 2020 data differentially impacts the FY 2022 ratesetting. One way to assess this factor is to model the change in the total case-mix, which is a driver of spending, if our assumption regarding the FY 2022 inpatient experience used in calculating the MS–DRG relative weights turns out to be less accurate based on actual FY 2022 experience. We estimated the difference in the total case-mix if we calculated the MS–DRG relative weights based on the FY 2019 claims data and the actual utilization is ultimately more similar to the FY 2020 data, as compared to if we calculated the MS–DRG relative weights based on the FY 2020 data and the actual utilization is ultimately more similar to the FY 2019 data.

We first calculated a set of MS–DRG relative weights using an assumption that the FY 2022 inpatient experience would be similar to the FY 2019 data. Specifically, we used the proposed version 39 GROUPER (which would be applicable to discharges occurring in FY 2022) and the FY 2019 MedPAR data to calculate MS–DRG relative weights. We refer to these MS–DRG relative weights as the FY 2019-based weights.

We next calculated a set of MS–DRG relative weights using an assumption that the FY 2022 inpatient experience would be more similar to the FY 2020 data. Specifically, we used the proposed version 39 GROUPER and the FY 2020 MedPAR data to calculate MS–DRG relative weights. This is how we would ordinarily calculate the proposed FY 2022 MS–DRG relative weights. We refer to these MS–DRG relative weights as the FY 2020-based weights.

We then estimated the difference in case-mix under the FY 2019-based weights and the FY 2020-based weights if the FY 2022 inpatient experience ended up being the reverse of the assumption made when calculating that set of relative weights. In other words, we compared estimated case-mix calculated under four different scenarios. For the FY 2019-based weights, we calculated the case-mix using claims from the FY 2019 MedPAR as an approximation of the actual FY 2022 experience (Scenario A), and using claims from the FY 2020 MedPAR as an approximation of the actual FY 2022 experience (Scenario B). For the FY 2020-based weights, we calculated the case-mix using claims from the FY 2020 MedPAR as an approximation of the actual FY 2022 experience (Scenario C), and using claims from the FY 2019 MedPAR as an approximation of the actual FY 2022 experience (Scenario D).

The results are shown in the following table.

Scenario	Assumed FY 2022 Experience for Relative Weights	Actual FY 2022 Experience	Case-mix	Assumption Matched Experience?	Percent Change in Case-mix if Mismatch between Assumption and Actual Experience
A	FY 2019	FY 2019	1.820	Yes	
B	FY 2019	FY 2020	1.885	No	0.0%
C	FY 2020	FY 2020	1.885	Yes	
D	FY 2020	FY 2019	1.816	No	-0.2%

[5] Section 3710 of the Coronavirus Aid, Relief, and Economic Security (CARES) Act directs the Secretary of HHS to increase the weighting factor of the assigned DRG by 20 percent for an individual diagnosed with COVID–19 discharged during the COVID–19 PHE period. In order to make the case-mix values more comparable, the 20 percent increase is not included.

In Scenario A and Scenario C, there is by definition no differential impact on total case-mix due to a less accurate assumption made when the MS–DRG relative weights were calculated: The FY 2022 inpatient experience matches the assumption used when the MS–DRG relative weights were calculated. In Scenario B and Scenario D, it is the reverse of the assumption used when the MS–DRG relative weights were calculated.

In Scenario B, when the FY 2019-based weights were used, but the FY 2022 inpatient experience turns out to be more similar to FY 2020 data, the less accurate assumption does not differentially impact the modelled case-mix. This can be seen by comparing the modelled case-mix under Scenario B (1.885) with the modelled case-mix under Scenario C (also 1.885). In other words, if the FY 2019-based weights and inpatient experience turn out to be more similar to the FY 2020 data, then the modelled case-mix is approximately the same as if we had used the FY 2020-based weights. The results show that use of the FY 2019-based weights did not impact the modelled case-mix compared to using the FY 2020-based weights.

The same conclusion is not true of Scenario D where the FY 2020-based weights were used, but the FY 2022 inpatient experience turns out to be more similar to FY 2019 data. Here the less accurate assumption does differentially impact the modelled case-mix, by −0.2 percent. This can be seen by comparing the modelled case-mix under Scenario D (1.816) with the modelled case-mix under Scenario A (1.820). In other words, if we use the FY 2020-based weights, and FY 2022 inpatient experience turns out to be more similar to FY 2019 data, the modelled case-mix is −0.2 percent lower than if we had used the FY 2019-based weights. This shows that use of the FY 2020-based weights does impact the modelled case-mix compared to a result from using the FY 2019-based weights.

Putting aside that we believe FY 2019 is a more likely approximation of the FY 2022 inpatient experience for the reasons discussed earlier, the previous analysis indicates that the differential effect of the FY 2022 MS–DRG relative weights is more limited if the FY 2019-based weights are used than it is if the FY 2020-based weights are used, should the FY 2022 inpatient experience not match the assumption used to calculate the MS–DRG relative weights.

Another payment factor that is impacted by the use of the FY 2019 or FY 2020 data in the FY 2022 ratesetting is the outlier fixed-loss threshold. As discussed in section II.A.4.j. of this proposed rule, section 1886(d)(5)(A) of the Act provides for payments in addition to the basic prospective payments for ''outlier'' cases involving extraordinarily high costs. To qualify for outlier payments, a case must have costs greater than the sum of certain payments and the ''outlier threshold'' or ''fixed-loss'' amount (a dollar amount by which the costs of a case must exceed payments in order to qualify for an outlier payment). In accordance with section 1886(d)(5)(A)(iv) of the Act, outlier payments for any year are projected to be not less than 5 percent nor more than 6 percent of total operating DRG payments plus outlier payments. We target 5.1 percent within this range. Section 1886(d)(3)(B) of the Act requires the Secretary to reduce the average standardized amount by a factor to account for the estimated proportion of total DRG payments made to outlier cases. In other words, outlier payments are prospectively estimated to be budget neutral overall under the IPPS.[6]

Under an assumption that the FY 2022 inpatient experience will be more similar to FY 2019 data, we estimate an outlier fixed-loss amount of $30,967. Under an assumption that FY 2022 inpatient experience will be more similar to FY 2020 data, we estimate an outlier fixed-loss amount of $36,843, a difference of $5,876 or approximately 20 percent higher. Again, putting aside that we believe FY 2019 is a better approximation of the FY 2022 inpatient experience for the reasons discussed earlier, the difference between the two estimated outlier fixed-loss amounts means there is a consequence to making a decision as to the best available data for estimating the FY 2022 outlier fixed-loss amount in the form of potentially exceeding or falling short of the targeted 5.1 percent of total operating DRG payments plus outlier payments.

In summary, we have highlighted two factors in the decision regarding the best available data to use in the FY 2022 ratesetting. The first factor is to what extent the FY 2019 data from before the COVID–19 PHE is a better overall approximation of FY 2022 inpatient experience, or alternatively, to what extent the FY 2020 data including the COVID–19 PHE time period is a better overall approximation of FY 2022 inpatient experience. After analyzing this issue and for the reasons discussed, we believe for purposes of this proposed rule that FY 2019 is generally a better overall approximation of FY 2022. The second factor is to what extent the decision to use the FY 2019 or FY 2020 data differentially impacts the FY 2022 IPPS ratesetting. After analyzing this issue, and as discussed previously, we have determined that the decision does differentially impact the overall FY 2022 IPPS ratesetting in two primary ways. First, a decision to base the MS–DRG relative weights on the FY 2020 data has an impact of −0.2 percent if the FY 2022 inpatient experience is more like FY 2019 data. Second, the decision to use the FY 2019 or FY 2020 data results in an approximately 20 percent difference in the estimate of the outlier fixed-loss amount.

Taking these factors into account, we are proposing to use the FY 2019 data for the FY 2022 ratesetting for circumstances where the FY 2020 data is significantly impacted by the COVID–19 PHE, primarily in that the data reflect generally markedly different utilization for certain types of services in FY 2020 than would have been expected in the absence of the PHE, as discussed previously. For example, we are proposing to use the FY 2019 MedPAR claims data for purposes where we ordinarily would have used the FY 2020 MedPAR claims data, such as in our analysis of changes to MS–DRG classifications (as discussed in greater detail section II.D. of the preamble of this proposed rule). Similarly, we are proposing to use cost report data from the FY 2018 HCRIS file for purposes where we ordinarily would have used the FY 2019 HCRIS file, such as in determining the proposed FY 2022 IPPS MS–DRG relative weights (as discussed in greater detail section II.E. of the preamble of this proposed rule). (As noted previously, the FY 2019 HCRIS data would contain many cost reports ending in FY 2020 based on each hospital's cost reporting period.) We note that MedPAR claims data and cost report data from the HCRIS file are examples of the data sources for which we discuss the proposed use of the FY 2019 data for the FY 2022 ratesetting in this proposed rule. We have clearly identified throughout this proposed rule where and how we are proposing to use alternative data than what ordinarily would be used for the proposed FY 2022 IPPS and LTCH PPS ratesetting, including certain provider specific information.

As discussed in section I.O. of Appendix A of this proposed rule, we are also considering, as an alternative to this proposal, the use of the same FY 2020 data that we would ordinarily use for purposes of FY 2022 ratesetting, and

[6] More information on outlier payments may be found on the CMS website at: *http://www.cms.gov/Medicare/Medicare-Fee-forService-Payment/AcuteInpatientPPS/outlier.html.*

which we may consider finalizing based on consideration of comments received. To facilitate comment on this alternative for FY 2022, we are making available the FY 2020 MedPAR file and the FY 2019 HCRIS file that we would ordinarily have provided in conjunction with this proposed rule. We are also making available the MS–DRG and MS–LTC–DRG relative weighting factors and length of stay information calculated using the FY 2020 data we would have ordinarily used. We are providing a file comparing the budget neutrality and other ratesetting adjustments calculated under our proposal with those adjustments calculated under this alternative approach. Finally, we are making available other proposed rule supporting data files based on the use of the FY 2020 data that we ordinarily would have provided, including: The IPPS and LTCH PPS Impact Files; the AOR/BOR File; the Case Mix Index File; and, the Standardizing File. We refer the reader to section I.O. of Appendix A of this proposed rule for more information on where these supplemental files may be found.

II. Proposed Changes to Medicare Severity Diagnosis-Related Group (MS–DRG) Classifications and Relative Weights

A. Background

Section 1886(d) of the Act specifies that the Secretary shall establish a classification system (referred to as diagnosis-related groups (DRGs) for inpatient discharges and adjust payments under the IPPS based on appropriate weighting factors assigned to each DRG. Therefore, under the IPPS, Medicare pays for inpatient hospital services on a rate per discharge basis that varies according to the DRG to which a beneficiary's stay is assigned. The formula used to calculate payment for a specific case multiplies an individual hospital's payment rate per case by the weight of the DRG to which the case is assigned. Each DRG weight represents the average resources required to care for cases in that particular DRG, relative to the average resources used to treat cases in all DRGs.

Section 1886(d)(4)(C) of the Act requires that the Secretary adjust the DRG classifications and relative weights at least annually to account for changes in resource consumption. These adjustments are made to reflect changes in treatment patterns, technology, and any other factors that may change the relative use of hospital resources.

B. Adoption of the MS–DRGs and MS–DRG Reclassifications

For information on the adoption of the MS–DRGs in FY 2008, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47140 through 47189).

For general information about the MS–DRG system, including yearly reviews and changes to the MS–DRGs, we refer readers to the previous discussions in the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43764 through 43766) and the FYs 2011 through 2021 IPPS/LTCH PPS final rules (75 FR 50053 through 50055; 76 FR 51485 through 51487; 77 FR 53273; 78 FR 50512; 79 FR 49871; 80 FR 49342; 81 FR 56787 through 56872; 82 FR 38010 through 38085, 83 FR 41158 through 41258, 84 FR 42058 through 42165, and 85 FR 58445 through 58596 respectively).

C. Proposed FY 2022 MS–DRG Documentation and Coding Adjustment

1. Background on the Prospective MS–DRG Documentation and Coding Adjustments for FY 2008 and FY 2009 Authorized by Public Law 110–90 and the Recoupment or Repayment Adjustment Authorized by Section 631 of the American Taxpayer Relief Act of 2012 (ATRA)

In the FY 2008 IPPS final rule with comment period (72 FR 47140 through 47189), we adopted the MS–DRG patient classification system for the IPPS, effective October 1, 2007, to better recognize severity of illness in Medicare payment rates for acute care hospitals. The adoption of the MS–DRG system resulted in the expansion of the number of DRGs from 538 in FY 2007 to 745 in FY 2008. By increasing the number of MS–DRGs and more fully taking into account patient severity of illness in Medicare payment rates for acute care hospitals, MS–DRGs encourage hospitals to improve their documentation and coding of patient diagnoses.

In the FY 2008 IPPS final rule with comment period (72 FR 47175 through 47186), we indicated that the adoption of the MS–DRGs had the potential to lead to increases in aggregate payments without a corresponding increase in actual patient severity of illness due to the incentives for additional documentation and coding. In that final rule with comment period, we exercised our authority under section 1886(d)(3)(A)(vi) of the Act, which authorizes us to maintain budget neutrality by adjusting the national standardized amount, to eliminate the estimated effect of changes in coding or classification that do not reflect real changes in case-mix. Our actuaries estimated that maintaining budget neutrality required an adjustment of −4.8 percentage points to the national standardized amount. We provided for phasing in this −4.8 percentage point adjustment over 3 years. Specifically, we established prospective documentation and coding adjustments of −1.2 percentage points for FY 2008, −1.8 percentage points for FY 2009, and −1.8 percentage points for FY 2010.

On September 29, 2007, Congress enacted the TMA [Transitional Medical Assistance], Abstinence Education, and QI [Qualifying Individuals] Programs Extension Act of 2007 (Pub. L. 110–90). Section 7(a) of Public Law 110–90 reduced the documentation and coding adjustment made as a result of the MS–DRG system that we adopted in the FY 2008 IPPS final rule with comment period to −0.6 percentage point for FY 2008 and −0.9 percentage point for FY 2009.

As discussed in prior year rulemakings, and most recently in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56780 through 56782), we implemented a series of adjustments required under sections 7(b)(1)(A) and 7(b)(1)(B) of Public Law 110–90, based on a retrospective review of FY 2008 and FY 2009 claims data. We completed these adjustments in FY 2013 but indicated in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53274 through 53275) that delaying full implementation of the adjustment required under section 7(b)(1)(A) of Public Law 110–90 until FY 2013 resulted in payments in FY 2010 through FY 2012 being overstated, and that these overpayments could not be recovered under Public Law 110–90.

In addition, as discussed in prior rulemakings and most recently in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38008 through 38009), section 631 of the American Taxpayer Relief Act of 2012 (ATRA) amended section 7(b)(1)(B) of Public Law 110–90 to require the Secretary to make a recoupment adjustment or adjustments totaling $11 billion by FY 2017. This adjustment represented the amount of the increase in aggregate payments as a result of not completing the prospective adjustment authorized under section 7(b)(1)(A) of Public Law 110–90 until FY 2013.

2. Adjustments Made for FYs 2018, 2019, 2020 and 2021 as Required Under Section 414 of Public Law 114–10 (MACRA) and Section 15005 of Public Law 114–255

As stated in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56785), once the recoupment required under section 631 of the ATRA was complete, we had anticipated making a single positive adjustment in FY 2018 to offset the reductions required to recoup the $11 billion under section 631 of the ATRA. However, section 414 of the MACRA (which was enacted on April 16, 2015) replaced the single positive adjustment we intended to make in FY 2018 with a 0.5 percentage point positive adjustment for each of FYs 2018 through 2023. In the FY 2017 rulemaking, we indicated that we would address the adjustments for FY 2018 and later fiscal years in future rulemaking. Section 15005 of the 21st Century Cures Act (Pub. L. 114–255), which was enacted on December 13, 2016, amended section 7(b)(1)(B) of the TMA, as amended by section 631 of the ATRA and section 414 of the MACRA, to reduce the adjustment for FY 2018 from a 0.5 percentage point positive adjustment to a 0.4588 percentage point positive adjustment. As we discussed in the FY 2018 rulemaking, we believe the directive under section 15005 of Public Law 114–255 is clear. Therefore, in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38009) for FY 2018, we implemented the required +0.4588 percentage point adjustment to the standardized amount. In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41157), the FY 2020 IPPS/LTCH PPS final rule (84 FR 42057), and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58444–58445), consistent with the requirements of section 414 of the MACRA, we implemented 0.5 percentage point positive adjustments to the standardized amount for FY 2019, FY 2020, and FY 2021, respectively. We indicated the FY 2018, FY 2019, FY 2020, and FY 2021 adjustments were permanent adjustments to payment rates. We also stated that we plan to propose future adjustments required under section 414 of the MACRA for FYs 2022 and 2023 in future rulemaking.

3. Proposed Adjustment for FY 2022

Consistent with the requirements of section 414 of the MACRA, we are proposing to implement a 0.5 percentage point positive adjustment to the standardized amount for FY 2022. This would constitute a permanent adjustment to payment rates. We plan to propose the final adjustment required under section 414 of the MACRA for FY 2023 in future rulemaking.

D. Proposed Changes to Specific MS–DRG Classifications

1. Discussion of Changes to Coding System and Basis for Proposed FY 2022 MS–DRG Updates

a. Conversion of MS–DRGs to the International Classification of Diseases, 10th Revision (ICD–10)

As of October 1, 2015, providers use the International Classification of Diseases, 10th Revision (ICD–10) coding system to report diagnoses and procedures for Medicare hospital inpatient services under the MS–DRG system instead of the ICD–9–CM coding system, which was used through September 30, 2015. The ICD–10 coding system includes the International Classification of Diseases, 10th Revision, Clinical Modification (ICD–10–CM) for diagnosis coding and the International Classification of Diseases, 10th Revision, Procedure Coding System (ICD–10–PCS) for inpatient hospital procedure coding, as well as the ICD–10–CM and ICD–10–PCS Official Guidelines for Coding and Reporting. For a detailed discussion of the conversion of the MS–DRGs to ICD–10, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56787 through 56789).

b. Basis for Proposed FY 2022 MS–DRG Updates

Given the need for more time to carefully evaluate requests and propose updates, as discussed in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38010), we changed the deadline to request updates to the MS–DRGs to November 1 of each year, which provided an additional five weeks for the data analysis and review process. In the FY 2021 IPPS/LTCH PPS proposed rule (85 FR 32472), we stated that with the continued increase in the number and complexity of the requested changes to the MS–DRG classifications since the adoption of ICD–10 MS–DRGs, and in order to consider as many requests as possible, more time is needed to carefully evaluate the requested changes, analyze claims data, and consider any proposed updates. We further stated we were changing the deadline to request changes to the MS–DRGs to October 20 of each year to allow for additional time for the review and consideration of any proposed updates. However, in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58445), due to the unique circumstances for the FY 2021 IPPS/LTCH PPS final rule for which we waived the delayed effective date, we maintained the deadline of November 1, 2020 for FY 2022 MS–DRG classification change requests. We also noted that we expected to reconsider a change in the deadline beginning with comments and suggestions submitted for FY 2023. While we continue to believe that a change in the deadline from November 1 to October 20 will provide hospitals sufficient time to assess potential impacts and inform future MS–DRG recommendations, we are maintaining the deadline of November 1 for FY 2023 MS–DRG classification change requests.

As noted, interested parties had to submit MS–DRG classification change requests for FY 2022 by November 1, 2020, and the comments that were submitted in a timely manner for FY 2022 are discussed in this section of the preamble of this proposed rule. As we discuss in the sections that follow, we may not be able to fully consider all of the requests that we receive for the upcoming fiscal year. We have found that, with the implementation of ICD–10, some types of requested changes to the MS–DRG classifications require more extensive research to identify and analyze all of the data that are relevant to evaluating the potential change. We note in the discussion that follows those topics for which further research and analysis are required, and which we will continue to consider in connection with future rulemaking. Interested parties should continue to submit any comments and suggestions for FY 2023 by November 1, 2021 via the CMS MS–DRG Classification Change Request Mailbox located at: *MSDRGClassificationChange@cms.hhs.gov*.

As we did for the FY 2021 IPPS/LTCH PPS proposed rule, for this FY 2022 IPPS/LTCH PPS proposed rule we are providing a test version of the ICD–10 MS–DRG GROUPER Software, Version 39, so that the public can better analyze and understand the impact of the proposals included in this proposed rule. We note that this test software reflects the proposed GROUPER logic for FY 2022. Therefore, it includes the new diagnosis and procedure codes that are effective for FY 2022 as reflected in Table 6A.—New Diagnosis Codes—FY 2022 and Table 6B.—New Procedure Codes—FY 2022 associated with this proposed rule and does not include the diagnosis codes that are invalid beginning in FY 2022 as reflected in Table 6C.—Invalid Diagnosis Codes—FY 2022 and Table 6D.—Invalid Procedure Codes—FY 2022 associated with this proposed rule. These tables are not published in the Addendum to this proposed rule, but are available via the

internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* as described in section VI. of the Addendum to this proposed rule. Because the diagnosis and procedure codes no longer valid for FY 2022 are not reflected in the test software, we are making available a supplemental file in Table 6P.1a that includes the mapped Version 39 FY 2022 ICD–10–CM codes and the deleted Version 38 FY 2021 ICD–10–CM codes that should be used for testing purposes with users' available claims data. In addition, we are making available a supplemental file in Table 6P.1b that includes the mapped Version 39 FY 2022 ICD–10–PCS codes and the deleted Version 38 FY 2021 ICD–10–PCS codes that should be used for testing purposes with users' available claims data. Therefore, users will have access to the test software allowing them to build case examples that reflect the proposals included in this proposed rule. In addition, users will be able to view the draft version of the ICD–10 MS–DRG Definitions Manual, Version 39.

The test version of the ICD–10 MS–DRG GROUPER Software, Version 39, the draft version of the ICD–10 MS–DRG Definitions Manual, Version 39, and the supplemental mapping files in Table 6P.1a and Table 6P.1b of the FY 2021 and FY 2022 ICD–10–CM diagnosis and ICD–10–PCS procedure codes are available at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software*.

Following are the changes that we are proposing to the MS–DRGs for FY 2022. We are inviting public comments on each of the MS–DRG classification proposed changes, as well as our proposals to maintain certain existing MS–DRG classifications discussed in this proposed rule. In some cases, we are proposing changes to the MS–DRG classifications based on our analysis of claims data and consultation with our clinical advisors. In other cases, we are proposing to maintain the existing MS–DRG classifications based on our analysis of claims data and consultation with our clinical advisors. As discussed in section I.F of the preamble of this proposed rule, we are proposing to use claims data from the March 2020 update of the FY 2019 MedPAR file in our analysis of proposed MS–DRG classification changes for FY 2022, consistent with our goal of using the best available data overall for ratesetting. Alternatively, we are also providing the results of our analysis of proposed MS–DRG classification changes using claims data from the September 2020 update of the FY 2020 MedPAR file. As a result, for this FY 2022 IPPS/LTCH PPS proposed rule, our MS–DRG analysis was based on ICD–10 claims data from the March 2020 update of the FY 2019 MedPAR file, which contains hospital bills received from October 1, 2018 through March 31, 2020, for discharges occurring through September 30, 2019. In addition, we also analyzed ICD–10 claims data from the September 2020 update of the FY 2020 MedPAR file, which contains hospital bills received from October 1, 2019 through September 30, 2020, for discharges occurring through September 30, 2020. In our discussion of the proposed MS–DRG reclassification changes, we refer to these claims data as the ''March 2020 update of the FY 2019 MedPAR file'' and ''the September 2020 update of the FY 2020 MedPAR file.''

As explained in previous rulemaking (76 FR 51487), in deciding whether to propose to make further modifications to the MS–DRGs for particular circumstances brought to our attention, we consider whether the resource consumption and clinical characteristics of the patients with a given set of conditions are significantly different than the remaining patients represented in the MS–DRG. We evaluate patient care costs using average costs and lengths of stay and rely on the judgment of our clinical advisors to determine whether patients are clinically distinct or similar to other patients represented in the MS–DRG. In evaluating resource costs, we consider both the absolute and percentage differences in average costs between the cases we select for review and the remainder of cases in the MS–DRG. We also consider variation in costs within these groups; that is, whether observed average differences are consistent across patients or attributable to cases that are extreme in terms of costs or length of stay, or both. Further, we consider the number of patients who will have a given set of characteristics and generally prefer not to create a new MS–DRG unless it would include a substantial number of cases.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58448), we finalized our proposal to expand our existing criteria to create a new complication or comorbidity (CC) or major complication or comorbidity (MCC) subgroup within a base MS–DRG. Specifically, we finalized the expansion of the criteria to include the NonCC subgroup for a three-way severity level split. We stated we believed that applying these criteria to the NonCC subgroup would better reflect resource stratification as well as promote stability in the relative weights by avoiding low volume counts for the NonCC level MS–DRGs. We noted that in our analysis of MS–DRG classification requests for FY 2021 that were received by November 1, 2019, as well as any additional analyses that were conducted in connection with those requests, we applied these criteria to each of the MCC, CC, and NonCC subgroups. We also noted that the application of the NonCC subgroup criteria going forward may result in modifications to certain MS–DRGs that are currently split into three severity levels and result in MS–DRGs that are split into two severity levels. We stated that any proposed modifications to the MS–DRGs would be addressed in future rulemaking consistent with our annual process and reflected in Table 5—Proposed List of Medicare Severity Diagnosis Related Groups (MS–DRGs), Relative Weighting Factors, and Geometric and Arithmetic Mean Length of Stay for the applicable fiscal year.

In our analysis of the MS–DRG classification requests for FY 2022 that we received by November 1, 2020, as well as any additional analyses that were conducted in connection with those requests, we applied these criteria to each of the MCC, CC, and NonCC subgroups, as described in the following table.

Criteria Number	Three-Way Split 123 (MCC vs CC vs NonCC)	Two-Way Split 1_23 MCC vs (CC+NonCC)	Two-Way Split 12_3 (MCC+CC) vs NonCC
1. At least 500 cases in the MCC/CC/NonCC group	500+ cases for MCC group; and 500+ cases for CC group; and 500+ cases for NonCC group	500+ cases for MCC group; and 500+ cases for (CC+NonCC) group	500+ cases for (MCC+CC) group; and 500+ cases for NonCC group
2. At least 5% of the patients are in the MCC/CC/NonCC group	5%+ cases for MCC group; and 5%+ cases for CC group; and 5%+ cases for NonCC group	5%+ cases for MCC group; and 5%+ cases for (CC+NonCC) group	5%+ cases for (MCC+CC) group; and 5%+ cases for NonCC group
3. There is at least a 20% difference in average cost between subgroups	20%+ difference in average cost between MCC group and CC group; and 20%+ difference in average cost between CC group and NonCC group	20%+ difference in average cost between MCC group and (CC+NonCC) group	20%+ difference in average cost between (MCC+ CC) group and NonCC group
4. There is at least a $2,000 difference in average cost between subgroups	$2,000+ difference in average cost between MCC group and CC group; and $2,000+ difference in average cost between CC group and NonCC group	$2,000+ difference in average cost between MCC group and (CC+ NonCC) group	$2,000+ difference in average cost between (MCC+ CC) group and NonCC group
5. The R2 of the split groups is greater than or equal to 3	R2 > 3.0 for the three way split within the base MS-DRG	R2 > 3.0 for the two way 1_23 split within the base MS-DRG	R2 > 3.0 for the two way 12_3 split within the base MS-DRG

In general, once the decision has been made to propose to make further modifications to the MS–DRGs as described previously, such as creating a new base MS–DRG, or in our evaluation of a specific MS–DRG classification request to split (or subdivide) an existing base MS–DRG into severity levels, all five criteria must be met for the base MS–DRG to be split (or subdivided) by a CC subgroup. We note that in our analysis of requests to create a new MS–DRG, we typically evaluate the most recent year of MedPAR claims data available. For example, we stated earlier that for this FY 2022 IPPS/LTCH PPS proposed rule, our MS–DRG analysis was based on ICD–10 claims data from both the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file. However, in our evaluation of requests to split an existing base MS–DRG into severity levels, as noted in prior rulemaking (80 FR 49368), we typically analyze the most recent two years of data. This analysis includes 2 years of MedPAR claims data to compare the data results from 1 year to the next to avoid making determinations about whether additional severity levels are warranted based on an isolated year's data fluctuation and also, to validate that the established severity levels within a base MS–DRG are supported. The first step in our process of evaluating if the creation of a new CC subgroup within a base MS–DRG is warranted is to determine if all the criteria is satisfied for a three way split. If the criteria fail, the next step is to determine if the criteria are satisfied for a two way split. If the criteria for both of the two way splits fail, then a split (or CC subgroup) would generally not be warranted for that base MS–DRG. If the three way split fails on any one of the five criteria and all five criteria for both two way splits (1_23 and 12_3) are met, we would apply the two way split with the highest R2 value. We note that if the request to split (or subdivide) an existing base MS–DRG into severity levels specifies the request is for either one of the two way splits (1_23 or 12_3), in response to the specific request, we will evaluate the criteria for both of the two way splits, however we do not also evaluate the criteria for a three way split.

For this FY 2022 IPPS/LTCH PPS proposed rule, using the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file, we also analyzed how applying the NonCC subgroup criteria to all MS–DRGs currently split into three severity levels would affect the MS–DRG structure beginning in FY 2022. Findings from our analysis indicated that approximately 32 MS–DRGs would be subject to change based on the three-way severity level split criterion finalized in FY 2021. Specifically, we found that applying the NonCC subgroup criteria to all MS–DRGs currently split into three severity levels would result in the deletion of 96 MS–DRGs (32 MS–DRGs × 3 severity levels = 96) and the creation of 58 new MS–DRGs. These updates would also involve a redistribution of cases, which would impact the relative weights, and, thus, the payment rates proposed for particular types of cases. We refer the reader to Table 6P.1c for the list of the 96 MS–DRGs that would be subject to deletion and the list of the 58 new MS–DRGs that would be proposed for creation for FY 2022 under this policy if the NonCC subgroup criteria were applied.

In light of the public health emergency (PHE), we have concerns about the impact of implementing this volume of MS–DRG changes at this time, and believe it may be appropriate to delay application of the NonCC subgroup criteria to existing MS–DRGs in order to maintain more stability in the current MS–DRG structure. Therefore, we are proposing to delay the application of the NonCC subgroup criteria to existing MS–DRGs with a three-way severity level split until FY 2023, and proposing for FY 2022 to maintain the current structure of the 32 MS–DRGs that currently have a three-way severity level split (total of 96 MS–DRGs) that would otherwise be subject to these criteria.

2. Pre-MDC: MS–DRG 018 Chimeric Antigen Receptor (CAR) T-Cell Therapy

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58451 through 58453), we finalized our proposal to create Pre-MDC MS–DRG 018 (Chimeric Antigen Receptor (CAR) T-cell Immunotherapy) and to reassign cases reporting ICD–10–PCS procedure codes XW033C3 (Introduction of engineered autologous chimeric antigen receptor t-cell immunotherapy into peripheral vein, percutaneous approach, new technology group 3) or XW043C3 (Introduction of engineered autologous chimeric antigen receptor t-cell immunotherapy into central vein, percutaneous approach, new technology group 3) from Pre-MDC MS–DRG 016 (Autologous Bone Marrow Transplant with CC/MCC or T-cell Immunotherapy), to new Pre-MDC MS–DRG 018 effective with discharges on and after October 1, 2020. We also finalized our proposal to revise the title for MS–DRG 016 from ''Autologous Bone Marrow Transplant with CC/MCC or T-cell Immunotherapy'' to ''Autologous Bone Marrow Transplant with CC/MCC'' to reflect these changes.

Additionally, in the FY 2021 IPPS/LTCH PPS final rule in response to public comments expressing concern that Pre-MDC MS–DRG 018 is specific to one mechanistic approach to cellular therapy, and in response to commenters who sought clarification on how future CAR T-cell and non-CAR T-cell therapy products would be assigned, we stated that if additional cellular therapies should become available, we would use our established process to determine the MS–DRG assignment. The commenters requested that CMS provide flexibility for future cellular therapies, as they are made available and not restrict Pre-MDC MS–DRG 018 to CAR T-cell therapies alone. In this section of this rule, we discuss the assignment of these therapies in more detail.

During the September 8–9, 2020 ICD–10 Coordination and Maintenance Committee meeting, several topics involving requests for new procedure codes related to CAR T-cell therapies, non-CAR T-cell therapies and other immunotherapies were discussed. We refer the reader to the CMS website at: *https://www.cms.gov/Medicare/Coding/ICD10/C-and-M-Meeting-Materials* for additional detailed information regarding these requests for new procedure codes. As noted in prior rulemaking (85 FR 32543), for new procedure codes that have been finalized through the ICD–10 Coordination and Maintenance Committee meeting process and are proposed to be classified as O.R. procedures or non-O.R. procedures affecting the MS–DRG, our clinical advisors recommend the MS–DRG assignment which is then made available in association with the proposed rule (Table 6B.—New Procedure Codes) and subject to public comment. These proposed assignments are generally based on the assignment of predecessor codes or the assignment of similar codes. As discussed in section II.D.13 of the preamble of this proposed rule, Table 6B.—New Procedure Codes, lists the new procedure codes that have been approved to date that will be effective with discharges on and after October 1, 2021. Included in Table 6B are the following new procedure codes that describe the administration of CAR T-cell and non-CAR T-cell therapies and other immunotherapies. Consistent with our established process, we examined the MS–DRG assignment for the predecessor codes to determine the most appropriate MS–DRG assignment and, consistent with the assignment of those predecessor codes, we are proposing to classify the following new procedure codes as non-O.R. procedures affecting Pre-MDC MS–DRG 018, as shown in Table 6B.—New Procedure Codes associated with this proposed rule and available via the internet on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index/*.

ICD-10-PCS Code	Description
XW033C7	Introduction of autologous engineered chimeric antigen receptor t-cell immunotherapy into peripheral vein, percutaneous approach, new technology group 7
XW033G7	Introduction of allogeneic engineered chimeric antigen receptor t-cell immunotherapy into peripheral vein, percutaneous approach, new technology group 7
XW033H7	Introduction of axicabtagene ciloleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7
XW033J7	Introduction of tisagenlecleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7
XW033K7	Introduction of idecabtagene vicleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7
XW033L7	Introduction of lifileucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7
XW033M7	Introduction of brexucabtagene autoleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7
XW033N7	Introduction of lisocabtagene maraleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7
XW043C7	Introduction of autologous engineered chimeric antigen receptor t-cell immunotherapy into central vein, percutaneous approach, new technology group 7
XW043G7	Introduction of allogeneic engineered chimeric antigen receptor t-cell immunotherapy into central vein, percutaneous approach, new technology group 7
XW043H7	Introduction of axicabtagene ciloleucel immunotherapy into central vein, percutaneous approach, new technology group 7
XW043J7	Introduction of tisagenlecleucel immunotherapy into central vein, percutaneous approach, new technology group 7
XW043K7	Introduction of idecabtagene vicleucel immunotherapy into central vein, percutaneous approach, new technology group 7
XW043L7	Introduction of lifileucel immunotherapy into central vein, percutaneous approach, new technology group 7
XW043M7	Introduction of brexucabtagene autoleucel immunotherapy into central vein, percutaneous approach, new technology group 7
XW043N7	Introduction of lisocabtagene maraleucel immunotherapy into central vein, percutaneous approach, new technology group 7

In connection with our proposed assignment of the listed procedure codes to Pre-MDC MS–DRG 018, we are also proposing to revise the title for Pre-MDC MS–DRG 018 ''Chimeric Antigen Receptor (CAR) T-cell Immunotherapy'' to ''Chimeric Antigen Receptor (CAR) T-cell and Other Immunotherapies'' to better reflect the cases reporting the administration of non-CAR T-cell therapies and other immunotherapies that would also be assigned to this MS–DRG (for example, Introduction of lifileucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7), in addition to CAR T-cell therapies.

3. MDC 03 (Diseases and Disorders of Ear, Nose and Throat)

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58462 through 58471), we finalized our proposal to create two new base MS–DRGs, 140 and 143, with a three-way severity level split for new MS–DRGs 140, 141, and 142 (Major Head and Neck Procedures with MCC, with CC, and without CC/MCC, respectively) and new MS–DRGs 143, 144, and 145 (Other Ear, Nose, Mouth And Throat O.R. Procedures with MCC, with CC, and without CC/MCC, respectively). We provided the list of procedure codes that were finalized to define the logic for the new MS–DRGs in Tables 6P.2a, 6P.2b, and 6P.2c associated with the final rule and available via the internet on the CMS website at *https://www.cms.gov/*

Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index/. We received two separate but related requests to review and reconsider the MS–DRG assignments for a subset of the procedure codes listed in Table 6P.2a (procedure codes assigned to MS–DRGs 140, 141, and 142) and Table 6P.2b (procedure codes assigned to MS–DRGs 143, 144, and 145). In this section of this proposed rule, we discuss each of these separate, but related requests.

a. Major Head and Neck Procedures

The requestor provided the following procedure codes from Table 6P.2a associated with the FY 2021 IPPS/LTCH PPS final rule for CMS to examine.

ICD-10-PCS Code	Description
0JB60ZZ	Excision of chest subcutaneous tissue and fascia, open approach
0JB70ZZ	Excision of back subcutaneous tissue and fascia, open approach
0JB80ZZ	Excision of abdomen subcutaneous tissue and fascia, open approach
0W9100Z	Drainage of cranial cavity with drainage device, open approach
0W910ZZ	Drainage of cranial cavity, open approach
0WC10ZZ	Extirpation of matter from cranial cavity, open approach
0WC13ZZ	Extirpation of matter from cranial cavity, percutaneous approach
0WC14ZZ	Extirpation of matter from cranial cavity, percutaneous endoscopic approach

The requestor stated that the listed procedure codes do not appear appropriately assigned to MS–DRGs 140, 141, and 142. According to the requestor, if any one of the five procedure codes describing a procedure performed on the cranial cavity (0W9100Z, 0W910ZZ, 0WC10ZZ, 0WC13ZZ, or 0WX14ZZ) is assigned in conjunction with a principal diagnosis from MDC 03 (Diseases and Disorders of Ear, Nose, Mouth, and Throat), it appears more appropriate that cases reporting the diagnosis and procedure combination would group to MS–DRGs 25, 26, and 27 (Craniotomy and Endovascular Intracranial Procedures with MCC, with CC, and without CC/MCC, respectively) (for example, ''craniotomy'' MS–DRGs) in MDC 01 (Diseases and Disorders of the Central Nervous System) or to MS–DRGs 981, 982, and 983 (Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively). The requestor stated that drainage and extirpation from the cranial cavity always involves drilling or cutting through the skull regardless of the approach, therefore the five procedure codes identified warrant assignment to the ''craniotomy'' MS–DRGs. For the three procedure codes describing excision of subcutaneous tissue of chest, back, or abdomen (0JB60ZZ, 0JB70ZZ, and 0JB80ZZ), the requestor stated those codes should group to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) because they are not pertinent to the ear, nose, mouth, or throat.

We reviewed this request and note that the five procedure codes describing procedures performed on the cranial cavity are already assigned to MDC 01 and group to the ''craniotomy'' MS–DRGs (25, 26, and 27) when reported with a principal diagnosis from MDC 01, and are also currently classified as Extensive O.R. procedures, resulting in assignment to MS–DRGs 981, 982, and 983 when any one of the five procedure codes is reported on the claim and is unrelated to the MDC to which the case was assigned based on the principal diagnosis. We also note that in addition to MS–DRGs 25, 26, and 27, MS–DRG 23 (Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator) and MS–DRG 24 (Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis without MCC) include procedures performed on structures located within the cranial cavity, are included in the range of MS–DRGs known as the ''craniotomy'' MS–DRGs in MDC 01, and the five procedure codes submitted by the requestor describing procedures performed on the cranial cavity are also assigned to these MS–DRGs. We refer the requestor to Appendix E of the ICD–10 MS–DRG Definitions Manual for further discussion of how each procedure code may be assigned to multiple MDCs and MS–DRGs under the IPPS. The ICD–10 MS–DRG Definitions Manual is located on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software*. We also note that these five procedure codes were previously assigned to MS–DRGs 131 and 132 (Cranial and Facial Procedures with and without CC/MCC, respectively) in MDC 03 under version 37 of the ICD–10 MS–DRGs prior to the restructuring that was finalized effective FY 2021 for MS–DRG 129 (Major Head and Neck Procedures with CC/MCC or Major Device) and MS–DRG 130 (Major Head and Neck Procedures without CC/MCC), MS–DRGs 131 and 132, and MS–DRGs 133 and 134 (Other Ear, Nose, Mouth and Throat O.R. Procedures with and without CC/MCC, respectively).

With regard to the three procedure codes describing excision of subcutaneous tissue of chest, back, or abdomen (0JB60ZZ, 0JB70ZZ, and 0JB80ZZ), the requestor suggested that the codes should group to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) specifically because they are not pertinent to the ear, nose, mouth, or throat, however, it is unclear if the requestor was concerned more broadly that the three procedure codes should not group to any MS–DRGs in MDC 03 (Diseases and Disorders of Ear, Nose and Throat), given the stated rationale for the request.

Upon our review, we believe that the three procedure codes describing excision of subcutaneous tissue of chest, back, and abdomen (0JB60ZZ, 0JB70ZZ, and 0JB80ZZ), which do not describe major head and neck procedures, were inadvertently included in Table 6P.2a for assignment to MS–DRGs 140, 141, and 142. However, we also believe that the codes are appropriate for assignment

in MDC 03 and note that the three procedure codes were previously assigned to MS–DRGs 133 and 134 (Other Ear, Nose, Mouth and Throat O.R. Procedures with and without CC/MCC, respectively) in MDC 03 prior to the restructuring that was finalized effective FY 2021 for MS–DRGs 129, 130, 131, 132, 133, and 134. We also provided the following clarification in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58470), as stated in the ICD–10 MS–DRG Definitions Manual, ''In each MDC there is usually a medical and a surgical class referred to as ''other medical diseases'' and ''other surgical procedures,'' respectively. The ''other'' medical and surgical classes are not as precisely defined from a clinical perspective. The other classes would include diagnoses or procedures, which were infrequently encountered or not well defined clinically. For example, the ''other'' medical class for the Respiratory System MDC would contain the diagnoses ''other somatoform disorders'' and ''congenital malformation of the respiratory system,'' while the ''other'' surgical class for the female reproductive MDC would contain the surgical procedures ''excision of liver'' (liver biopsy in ICD–9–CM) and ''inspection of peritoneal cavity'' (exploratory laparotomy in ICD–9–CM). The ''other'' surgical category contains surgical procedures which, while infrequent, could still reasonably be expected to be performed for a patient in the particular MDC.''

During our review of procedure codes 0JB60ZZ, 0JB70ZZ, and 0JB80ZZ (describing excision of subcutaneous tissue of chest, back, and abdomen, respectively) we also confirmed that these procedures are currently designated as Extensive O.R. procedures. Consistent with other procedure codes on the Non-extensive procedure code list, we do not believe the procedures described by these procedure codes necessarily utilize the resources or have the level of technical complexity as the procedures on the Extensive O.R. procedures list. Therefore, we agree that the procedure codes describing these procedures would be more appropriately designated as Non-extensive procedures and group to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) when any one of the three procedure codes is reported on a claim and is unrelated to the MDC to which the case was assigned based on the principal diagnosis. We refer the reader to section II.D.10. of the preamble of this proposed rule for further discussion regarding our proposal to reassign these procedure codes from MS–DRGs 981, 982, and 983 (Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) for FY 2022.

Therefore, we are proposing to reassign the three procedure codes describing excision of subcutaneous tissue of chest, back, or abdomen (0JB60ZZ, 0JB70ZZ, and 0JB80ZZ) from MS–DRGs 140, 141, and 142 (Major Head and Neck Procedures with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 143, 144, and 145 (Other Ear, Nose, Mouth And Throat O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 03 for FY 2022. We refer the reader to section II.D.10. of the preamble of this proposed rule for further discussion regarding the designation of these codes as Extensive O.R. procedures versus Non-extensive O.R. procedures and our proposed reassignment of these codes from MS–DRGs 981, 982, and 983 to MS–DRGs 987, 988, and 989 for FY 2022.

b. Other Ear, Nose, Mouth and Throat O.R. Procedures

As stated earlier, we received two separate but related requests to review and reconsider the MS–DRG assignments for a subset of the procedure codes listed in Table 6P.2a and Table 6P.2b. In this section of this proposed rule, we discuss the second request related to procedure codes listed in Table 6P.2b associated with the FY 2021 IPPS/LTCH PPS final rule and currently assigned to MS–DRGs 143, 144 and 145.

The requestor provided a list of 82 procedure codes from Table 6P.2b associated with the FY 2021 IPPS/LTCH PPS final rule for CMS to examine. We refer the reader to Table 6P.1d associated with this FY 2022 IPPS/LTCH PPS proposed rule and available via the internet at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index/* for the list of procedure codes that were provided by the requestor. According to the requestor, if any one of the 82 procedure codes is assigned in conjunction with a principal diagnosis code from MDC 03, it appears more appropriate that cases reporting the diagnosis and procedure code combination would group to MS–DRGs 981, 982, and 983 (Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) or to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) versus MS–DRGs 143, 144, and 145 (Other Ear, Nose, Mouth And Throat O.R. Procedures with MCC, with CC, and without CC/MCC, respectively). However, the requestor also stated that of the 82 procedure codes, the following three procedure codes describing control of bleeding in the cranial cavity warrant grouping to MS–DRGs 25, 26, and 27 (for example, ''craniotomy'' MS–DRGs) in MDC 01, for the same reasons previously described in the prior section pertaining to the five other procedures performed on the cranial cavity.

ICD-10-PCS Code	Description
0W310ZZ	Control bleeding in cranial cavity, open approach
0W313ZZ	Control bleeding in cranial cavity, percutaneous approach
0W314ZZ	Control bleeding in cranial cavity, percutaneous endoscopic approach

We reviewed this request and similar to the discussion in the prior section for the separate but related request, we note that the ''other'' surgical category contains surgical procedures which, while infrequent, could still reasonably be expected to be performed for a patient in the particular MDC. We continue to believe that the 82

procedure codes provided by the requestor are appropriately assigned to MS–DRGs 143, 144, and 145 in MDC 03. With regard to the requestor's assertion that cases reporting any one of the 82 procedure codes would more appropriately group to the MS–DRGs for Extensive O.R. procedures or Non-extensive O.R. procedures when reported in conjunction with a principal diagnosis from MDC 03, we note that, as shown in Table 6P.2b associated with the FY 2021 IPPS/LTCH PPS final rule, the procedure codes that were finalized for assignment to MS–DRGs 143, 144, and 145 were previously assigned to MS–DRGs 129 and 130, 131 and 132, or 133 and 134 in MDC 03. We also note that, as discussed in prior rulemaking, cases that contain O.R. procedures will map to MS–DRG 981, 982, or 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) or MS–DRG 987, 988, or 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) when they do not contain a principal diagnosis that corresponds to one of the MDCs to which that procedure is assigned. For these reasons, we are proposing to maintain the current structure for MS–DRGs 143, 144, and 145 for FY 2022.

With regard to the three procedure codes describing control of bleeding in the cranial cavity (0W310ZZ, 0W313ZZ, and 0W314ZZ), and the requestor's suggestion that the codes should group to MS–DRGs 25, 26, and 27 in MDC 01, we consulted with our clinical advisors who stated these procedures are consistent with the existing procedure codes included in the logic for case assignment to MS–DRGs 25, 26, and 27. We refer the reader to section II.D.10. of the preamble of this proposed rule for further discussion of this request, as well as our proposed assignment of these codes to MS–DRGs 23, 24, 25, 26, and 27 for FY 2022.

4. MDC 04 (Diseases and Disorders of the Respiratory System)

a. Bronchiectasis

We received a request to reassign cases reporting diagnosis codes describing bronchiectasis from MS–DRGs 190, 191, and 192 (Chronic Obstructive Pulmonary Disease with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 177, 178, and 179 (Respiratory Infections and Inflammation with MCC, with CC, and without CC/MCC, respectively). Bronchiectasis is described by the following diagnosis codes

ICD-10-CM Code	Description
J47.0	Bronchiectasis with acute lower respiratory infection
J47.1	Bronchiectasis with (acute) exacerbation
J47.9	Bronchiectasis, uncomplicated
Q33.4	Congenital bronchiectasis

According to the requestor, the underlying pathophysiology of bronchiectasis is more similar to cystic fibrosis than it is to chronic obstructive pulmonary disease (COPD). The requestor stated that in bronchiectasis, there is an inciting event that creates scarring in the lung which prevents the lung from clearing out mucous like it normally would. The accumulation of abnormal mucous results in an environment conducive to bacterial growth and commonly found bacteria in this setting is very similar to those of cystic fibrosis with staphylococcus aureus, pseudomonas aeruginosa, and non-tuberculous mycobacterium. The requestor reported that when patients develop an exacerbation of bronchiectasis, this is because of a buildup of mucous compounded by overwhelming growth of the previously mentioned bacteria. The requestor also stated that patients admitted to the hospital for bronchiectasis exacerbation are treated aggressively with intravenous (IV) antibiotics to suppress the bacterial infection in combination with airway clearance therapies. The requestor further stated that, unlike in an acute COPD exacerbation, these patients do not always require steroids as there is not necessarily airway reactivity.

The requestor maintained that the underlying reason for admission to the hospital for these patients is the bacterial infection component of the exacerbation, with the standard course of treatment for these pulmonary bacterial infections averaging a minimum of 10–14 days due to the slow growing nature of the bacteria commonly encountered in these patients.

We reviewed this request and believe that bronchiectasis is appropriately assigned to MS–DRGs 190, 191, and 192 (Chronic Obstructive Pulmonary Disease with MCC, with CC, and without CC/MCC, respectively) because bronchiectasis, like COPD, is a chronic condition. With respect to the requestor's comments, cystic fibrosis, a genetic disease that affects mucous producing cells resulting in recurring lung infections, can lead to bronchiectasis. However, our clinical advisors indicated that the cause of bronchiectasis can be multifactorial or even remain undefined. Regardless of the cause, when present, bronchiectasis is an irreversible chronic pulmonary condition due to abnormal change to or destruction of normal pulmonary anatomy (the major bronchi and bronchiole walls), resulting in impaired air movement in and out of the lungs. COPD, regardless of the cause (smoking, pollution, other exposures), is a chronic pulmonary condition due to change/destruction of normal pulmonary anatomy, resulting in impaired air movement in and out of the lungs. Both bronchiectasis and COPD patients have abnormal pulmonary function tests and abnormal anatomic findings on chest x-ray and/or chest CT. Therefore, for these reasons, we are proposing to maintain the structure of MS–DRGs 190, 191, and 192 for FY 2022.

b. Major Chest Procedures

In the FY 2020 IPPS/LTCH PPS proposed (84 FR 19234) and final rules (84 FR 42148), we stated that in review of the procedures that are currently assigned to MS–DRGs 163, 164, and 165 (Major Chest Procedures with MCC, with CC and without CC/MCC, respectively) and 166, 167, and 168 (Other Respiratory System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively), that further refinement of these MS–DRGs may be warranted. In this section of this proposed rule, we discuss our review of the procedures and our proposal for

restructuring these MS–DRGs for FY 2022.

We began our review of MS–DRGs 163, 164, 165, 166, 167, and 168 by first examining all the procedures currently assigned to these MS–DRGs. We refer the reader to the ICD–10 MS–DRG Definitions Manual Version 38.1, which is available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS* for complete documentation of the GROUPER logic for MS–DRGs 163, 164, 165, 166, 167, and 168.

In our review of the procedures currently assigned to MS–DRGs 163, 164, 165, 166, 167, and 168, we found 17 procedure codes in MS–DRGs 163, 164, and 165 describing laser interstitial thermal therapy (LITT) of body parts that do not describe areas within the respiratory system, which would not be clinically appropriate to maintain in the logic. These procedure codes are listed in the following table.

ICD-10-PCS Code	Description
D0Y6KZZ	Laser interstitial thermal therapy of spinal cord
D0Y7KZZ	Laser interstitial thermal therapy of peripheral nerve
DDY0KZZ	Laser interstitial thermal therapy of esophagus
DDY1KZZ	Laser interstitial thermal therapy of stomach
DDY2KZZ	Laser interstitial thermal therapy of duodenum
DDY3KZZ	Laser interstitial thermal therapy of jejunum
DDY4KZZ	Laser interstitial thermal therapy of ileum
DDY5KZZ	Laser interstitial thermal therapy of colon
DDY7KZZ	Laser interstitial thermal therapy of rectum
DDY8KZZ	Laser interstitial thermal therapy of anus
DFY1KZZ	Laser interstitial thermal therapy of gallbladder
DFY2KZZ	Laser interstitial thermal therapy of bile ducts
DFY3KZZ	Laser interstitial thermal therapy of pancreas
DGY2KZZ	Laser interstitial thermal therapy of adrenal glands
DMY0KZZ	Laser interstitial thermal therapy of left breast
DMY1KZZ	Laser interstitial thermal therapy of right breast
DVY0KZZ	Laser interstitial thermal therapy of prostate

During our review of these 17 procedure codes, we identified additional MDCs and MS–DRG assignments that are also not clinically appropriate to maintain in the logic because the body parts described by the codes are not consistent with the organ system, etiology or clinical specialty of the MDC to which the procedure code is currently assigned. For example, 16 of the 17 procedure codes (all except procedure code DVY0KZZ) are included in the logic for case assignment to MDC 12 (Diseases and Disorders of the Male Reproductive System) in MS–DRGs 715 and 716 (Other Male Reproductive System O.R. Procedures for Malignancy with and without CC/MCC, respectively) and MS–DRGs 717 and 718 (Other Male Reproductive System O.R. Procedures Except Malignancy with and without CC/MCC, respectively) which is not clinically appropriate. Therefore, we are proposing to reassign these 17 procedure codes from their current MS–DRG assignments in MDC 04, and from the additional MDCs and MS–DRGs identified during our review that were found to be clinically inappropriate, to their clinically appropriate MDC and MS–DRGs as shown in Table 6P.2b associated with this proposed rule (which is available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*).

During our review of the procedure codes describing LITT of various body parts we also confirmed that these procedures are currently designated as Extensive O.R. procedures. We do not believe the procedures described by these procedure codes necessarily utilize the resources or have the level of technical complexity as the other procedures on the Extensive O.R. procedures list. We believe that the procedure codes describing these procedures would be more appropriately designated as Non-extensive procedures and group to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) when any one of the procedure codes is reported on a claim and is unrelated to the MDC to which the case was assigned based on the principal diagnosis. We refer the reader to section II.D.10. of the preamble of this proposed rule for further discussion regarding our proposal to reassign these procedure codes from MS–DRGs 981, 982, and 983 (Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) for FY 2022.

We also identified five procedure codes describing repair of the esophagus procedures currently assigned to MS–DRGs 163, 164, and 165 that would not be clinically appropriate to maintain in the logic. The procedure codes are 0DQ50ZZ (Repair esophagus, open approach), 0DQ53ZZ (Repair esophagus, percutaneous approach), 0DQ54ZZ (Repair esophagus, percutaneous

endoscopic approach), 0DQ57ZZ (Repair esophagus, via natural or artificial opening), and 0DQ58ZZ (Repair esophagus, via natural or artificial opening endoscopic), and are currently assigned to the following MDCs and MS–DRGs.

BILLING CODE 4120–01–P

MDC	Description	MS-DRG	Description
03	Diseases and Disorders of the Ear, Nose, Mouth and Throat	143	Other Ear, Nose, Mouth and Throat O.R. Procedures with MCC
		144	Other Ear, Nose, Mouth and Throat O.R. Procedures with CC
		145	Other Ear, Nose, Mouth and Throat O.R. Procedures without CC/MCC
06	Diseases and Disorders of the Digestive System	326	Stomach, Esophageal and Duodenal Procedures with MCC
		327	Stomach, Esophageal and Duodenal Procedures with CC
		328	Stomach, Esophageal and Duodenal Procedures without CC/MCC
17	Myeloproliferative Diseases and Disorders, and Poorly Differentiated Neoplasms	820	Lymphoma and Leukemia with Major O.R. Procedures with MCC
		821	Lymphoma and Leukemia with Major O.R. Procedures with CC
		822	Lymphoma and Leukemia with Major O.R. Procedures without CC/MCC
		826	Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures with MCC
		827	Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures with CC
		828	Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures without CC/MCC

21	Injuries, Poisonings and Toxic Effects of Drugs	907	Other O.R. Procedures for Injuries with MCC
		908	Other O.R. Procedures for Injuries with CC
		909	Other O.R. Procedures for Injuries without CC/MCC
24	Multiple Significant Trauma	957	Other O.R. Procedures for Multiple Significant Trauma with MCC
		958	Other O.R. Procedures for Multiple Significant Trauma with CC
		959	Other O.R. Procedures for Multiple Significant Trauma without CC/MCC

BILLING CODE 4120–01–C

The five procedure codes describing repair of esophagus procedures are not clinically coherent with the other procedures in MS–DRGs 163, 164, and 165 that describe procedures performed on major chest structures. Therefore, we are proposing to remove procedure codes 0DQ50ZZ, 0DQ53ZZ, 0DQ54ZZ, 0DQ57ZZ, and 0DQ58ZZ from the logic in MDC 04 for FY 2022.

During our review of procedure codes 0DQ50ZZ, 0DQ53ZZ, 0DQ54ZZ, 0DQ57ZZ, and 0DQ58ZZ (describing repair of esophagus procedures) we also confirmed that these procedures are currently designated as Extensive O.R. procedures. We do not believe the procedures described by procedure codes 0DQ53ZZ, 0DQ57ZZ, and 0DQ58ZZ necessarily utilize the resources or have the level of technical complexity as the other procedures on the Extensive O.R. procedures list. We believe that the procedure codes describing these procedures would be more appropriately designated as Non-extensive procedures and group to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) when any one of the three procedure codes is reported on a claim and is unrelated to the MDC to which the case was assigned based on the principal diagnosis. We refer the reader to section II.D.10. of the preamble of this proposed rule for further discussion regarding our proposal to reassign these procedure codes from MS–DRGs 981, 982, and 983 (Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) for FY 2022.

Next, we examined claims data from the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file for all cases in MS–DRGs 163, 164, 165, 166, 167, and 168. Our findings are shown in the following tables.

March 2020 Update of the FY 2019 MedPAR File			
MS-DRG	**Number of Cases**	**Average Length of Stay**	**Average Costs**
163	10,851	11.7	$34,904
164	15,743	5.4	$19,258
165	8,144	3.1	$14,120
166	10,151	10.6	$26,677
167	6,483	5.0	$13,517
168	2,420	2.6	$10,117

September 2020 Update of the FY 2020 MedPAR File			
MS-DRG	Number of Cases	Average Length of Stay	Average Costs
163	9,227	11.1	$35,694
164	13,121	5.1	$19,786
165	6,339	3.0	$14,991
166	8,213	10.7	$27,939
167	4,889	5.0	$14,288
168	1,726	2.5	$10,566

As shown in the tables, there were a higher number of cases reported in MS–DRGs 163, 164, 165, 166, 167, and 168 from the March 2020 update of the FY 2019 MedPAR file in comparison to the September 2020 update of the FY 2020 MedPAR file and overall, the cases reported have comparable average lengths of stay and comparable average costs for both fiscal years.

We then examined claims data from both the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file for MS–DRGs 163, 164, 165, 166, 167, and 168 to compare costs, complexity of service and clinical coherence for each procedure code currently assigned to these MS–DRGs to assess any potential reassignment of the procedures. We refer the reader to Table 6P.1e and Table 6P.1f associated with this proposed rule (which is available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*) for the detailed claims data analysis. Table 6P.1e contains the data analysis findings of procedure codes currently assigned to MS–DRGs 163, 164, 165, 166, 167, and 168 from the March 2020 update of the FY 2019 MedPAR file and Table 6P.1f contains the data analysis findings of procedure codes currently assigned to MS–DRGs 163, 164, 165, 166, 167, and 168 from the September 2020 update of the FY 2020 MedPAR file. We note that if a procedure code that is currently assigned to MS–DRGs 163, 164, 165, 166, 167, or 168 is not displayed, it is because there were no cases found reporting that code in the assigned MS–DRG.

As shown in Table 6P.1e and Table 6P.1f associated with this proposed rule, in our examination of the claims data from both the March 2020 update of the FY 2019 MedPAR file and September 2020 update of the FY 2020 MedPAR file, we found there is wide variation in the volume, length of stay, and average costs for the procedures currently assigned to MS–DRGs 163, 164, 165, 166, 167, and 168. There were several instances in which only one occurrence of a procedure was reported with a procedure code from MS–DRGs 163, 164, 165, 166, 167, or 168, and the average length of stay for these specific cases ranged from 1 day to 97 days. For example, in the analysis of claims data from the March 2020 update of the FY 2019 MedPAR file, during our review of MS–DRG 163, we found 153 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 2 days to 65 days and the average costs ranging from $3,760 to $195,447 for these cases. For MS–DRG 164, we found 145 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 1 day to 28 days and the average costs ranging from $1,886 to $137,810 for these cases. For MS–DRG 165, we found 111 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 1 day to 23 days and the average costs ranging from $2,656 to $73,092 for these cases. For MS–DRG 166, we found 150 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 1 day to 61 days and the average costs ranging from $3,230 to $246,679 for these cases. For MS–DRG 167, we found 110 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 1 day to 23 days and the average costs ranging from $2,058 to $149,220 for these cases. For MS–DRG 168, we found 68 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 1 day to 18 days and the average costs ranging from $2,033 to $35,576 for these cases.

Our analysis of the claims data from the September 2020 update of the FY 2020 MedPAR file resulted in similar findings to those from the March 2020 update of the FY 2019 MedPAR file; there were several instances in which only one occurrence of a procedure was reported with a procedure code from MS–DRGs 163, 164, 165, 166, 167, or 168. During our review of MS–DRG 163, we found 139 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 2 days to 97 days and the average costs ranging from $5,697 to $205,696 for these cases. For MS–DRG 164, we found 122 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 1 day to 35 days and the average costs ranging from $3,204 to $120,128 for these cases. For MS–DRG 165, we found 92 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 1 day to 16 days and the average costs ranging from $2,682 to $164,014 for these cases. For MS–DRG 166, we found 141 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 1 day to 45 days and the average costs ranging from $3,230 to $246,679 for these cases. For MS–DRG 167, we found 105 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 1 day to 22 days and the average costs ranging from $2,150 to $112,465 for these cases. For MS–DRG 168, we found 72 procedures for which only one occurrence of the procedure was reported with the average length of stay ranging from 1 day to 9 days and the average costs ranging from $1,563 to $76,061 for these cases.

Our clinical advisors reviewed the procedures currently assigned to MS–DRGs 163, 164, 165, 166, 167, and 168 to identify the patient attributes that currently define each of these procedures and to group them with respect to complexity of service and resource intensity. This process included separating the procedures according to the surgical approach (open, percutaneous, percutaneous endoscopic, via natural or artificial opening, via natural or artificial opening endoscopic, and external).

We also considered the claims data from the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file for MS–DRGs 163, 164, 165, 166, 167, and 168 to further analyze the average length of stay and average costs for the cases reporting procedures assigned to any one of these MS–DRGs as well as clinical coherence for these cases. For example, procedures that we believe represent greater treatment difficulty and reflect a class of patients who are similar clinically with regard to consumption of hospital resources were grouped separately from procedures that we believe to be less complex but still reflect patients who are similar clinically with regard to consumption of hospital resources. This approach differentiated the more complex procedures, such as procedures performed on the sternum and ribs (for example, major chest) from the less complex procedures such as bypass procedures performed on peripheral vessels or diagnostic biopsies.

As an initial step in our proposed restructuring of these MS–DRGs, we identified the following 26 procedure codes that are currently assigned to MS–DRGs 166, 167, and 168 that we believe represent procedures performed on structures that align more appropriately with the procedures assigned to MS–DRGs 163, 164, and 165 that describe major chest procedures.

ICD-10-PCS Code	Description
02QP4ZZ	Repair pulmonary trunk, percutaneous endoscopic approach
02QQ0ZZ	Repair right pulmonary artery, open approach
02QQ4ZZ	Repair right pulmonary artery, percutaneous endoscopic approach
02QR0ZZ	Repair left pulmonary artery, open approach
02QR4ZZ	Repair left pulmonary artery, percutaneous endoscopic approach
02QW0ZZ	Repair thoracic aorta, descending, open approach
02QW4ZZ	Repair thoracic aorta, descending, percutaneous endoscopic approach
02QX0ZZ	Repair thoracic aorta, ascending/arch, open approach
02QX4ZZ	Repair thoracic aorta, ascending/arch, percutaneous endoscopic approach
0PH000Z	Insertion of rigid plate internal fixation device into sternum, open approach
0PH004Z	Insertion of internal fixation device into sternum, open approach
0PH040Z	Insertion of rigid plate internal fixation device into sternum, percutaneous endoscopic approach
0PH044Z	Insertion of internal fixation device into sternum, percutaneous endoscopic approach
0PH144Z	Insertion of internal fixation device into 1 to 2 ribs, percutaneous endoscopic approach
0PH204Z	Insertion of internal fixation device into 3 or more ribs, open approach
0PH244Z	Insertion of internal fixation device into 3 or more ribs, percutaneous endoscopic approach
0PQ00ZZ	Repair sternum, open approach
0PQ04ZZ	Repair sternum, percutaneous endoscopic approach
0PS10ZZ	Reposition 1 to 2 ribs, open approach
0PS144Z	Reposition 1 to 2 ribs with internal fixation device, percutaneous endoscopic approach
0PS204Z	Reposition 3 or more ribs with internal fixation device, open approach
0PS20ZZ	Reposition 3 or more ribs, open approach
0PS244Z	Reposition 3 or more ribs with internal fixation device, percutaneous endoscopic approach
0PT00ZZ	Resection of sternum, open approach
0PT10ZZ	Resection of 1 to 2 ribs, open approach
0PT20ZZ	Resection of 3 or more ribs, open approach

We analyzed claims data from the March 2020 update of the FY 2019 MedPAR file for the listed procedure codes in MS–DRGs 166, 167, and 168. We note that if a listed procedure code is not displayed, it is because there were no cases found reporting that code among MS–DRGs 166, 167, and 168. Our findings are shown in the following table.

ICD-10-PCS Code	Description	Frequency	Average Length of Stay	Average Costs
02QR0ZZ	Repair left pulmonary artery, open approach	1	1	$3,463
02QW0ZZ	Repair thoracic aorta, descending, open approach	1	15	$46,829
0PH204Z	Insertion of internal fixation device into 3 or more ribs, open approach	5	6.4	$23,032
0PQ00ZZ	Repair sternum, open approach	1	11	$18,388
0PS10ZZ	Reposition 1 to 2 ribs, open approach	2	6.0	$22,019
0PS144Z	Reposition 1 to 2 ribs with internal fixation device, percutaneous endoscopic approach	2	8.5	$25,123
0PS204Z	Reposition 3 or more ribs with internal fixation device, open approach	288	9.47	$44,510
0PS244Z	Reposition 3 or more ribs with internal fixation device, percutaneous endoscopic approach	3	5.67	$37,069
0PT10ZZ	Resection of 1 to 2 ribs, open approach	9	10.58	$22,901
0PT20ZZ	Resection of 3 or more ribs, open approach	2	73.5	$183,630

We then analyzed claims data from the September 2020 update of the FY 2020 MedPAR file for the listed procedure codes in MS–DRGs 166, 167, and 168. We note that if a listed procedure code is not displayed, it is because there were no cases found reporting that code among MS–DRGs 166, 167, and 168. Our findings are shown in the following table.

ICD-10-PCS Code	Description	Frequency	Average Length of Stay	Average Costs
02QX0ZZ	Repair thoracic aorta, ascending/arch, open approach	2	20	$134,670
0PH000Z	Insertion of rigid plate internal fixation device into sternum, open approach	2	11.5	$58,192
0PH004Z	Insertion of internal fixation device into sternum, open approach	4	18.5	$34,164
0PH044Z	Insertion of internal fixation device into sternum, percutaneous endoscopic approach	1	6	$19,501
0PH144Z	Insertion of internal fixation device into 1 to 2 ribs, percutaneous endoscopic approach	3	7.7	$26,846
0PH204Z	Insertion of internal fixation device into 3 or more ribs, open approach	18	10.1	$39,546

0PH244Z	Insertion of internal fixation device into 3 or more ribs, percutaneous endoscopic approach	1	10	$40,069
0PQ00ZZ	Repair sternum, open approach	5	6.4	$31,049
0PS10ZZ	Reposition 1 to 2 ribs, open approach	1	16	$147,493
0PS144Z	Reposition 1 to 2 ribs with internal fixation device, percutaneous endoscopic approach	3	8.3	$25,944
0PS204Z	Reposition 3 or more ribs with internal fixation device, open approach	344	9.6	$48,340
0PS20ZZ	Reposition 3 or more ribs, open approach	1	12	$22,535
0PS244Z	Reposition 3 or more ribs with internal fixation device, percutaneous endoscopic approach	5	5.2	$38,618
0PT00ZZ	Resection of sternum, open approach	1	3.0	$7,072
0PT10ZZ	Resection of 1 to 2 ribs, open approach	7	7.9	$29,222
0PT20ZZ	Resection of 3 or more ribs, open approach	3	13	$32,933

We refer the reader to Tables 6P.1e and 6P.1f for detailed claims data for the previously listed procedures in MS–DRGs 163, 164, 165, 166, 167, and 168 from the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file, respectively, and note that while some of the 26 listed procedure codes identified in MS–DRGs 166, 167, and 168 may not have been reported in either year's MedPAR claims data or only had one occurrence in which the procedure was reported, we believe these procedures described by the listed 26 procedure codes are clinically coherent with the other procedures that are currently assigned to MS–DRGs 163, 164, and 165. For example, in our analysis of the March 2020 update of the FY 2019 MedPAR file, as shown in the table, we found procedure code 02QW0ZZ reported with one occurrence with an average length of stay of 15 days and average costs of $46,829. Despite finding only one case, we believe procedures described by this procedure code, as well as related procedure codes describing procedures performed on the great vessels, are more clinically coherent with the procedures assigned to MS–DRGs 163, 164, and 165 and align more appropriately with the average length of stay and average costs of those MS–DRGs. Similarly, in our analysis of the September 2020 update of the FY 2020 MedPAR file, as shown in the table, we found procedure code 0PS204Z reported with 344 occurrences with an average length of stay of 9.6 days and average costs of $48,340. We believe procedures described by this procedure code, as well as related procedure codes describing procedures performed to repair or resect the ribs, are more clinically coherent with the procedures assigned to MS–DRGs 163, 164, and 165 and also align more appropriately with the average length of stay and average costs of those MS–DRGs.

As a result of our preliminary review of MS–DRGs 163, 164, 165, 166, 167, and 168, for FY 2022 we are proposing the reassignment of the listed 26 procedure codes (9 procedure codes describing repair of pulmonary or thoracic structures, and 17 procedure codes describing procedures performed on the sternum or ribs) from MS–DRGs 166, 167, and 168 to MS–DRGs 163, 164, and 165 in MDC 04. Our data analysis shows that for the cases reporting any one of the 26 procedure codes, generally, they have an average length of stay and average costs that appear more consistent with the average length of stay and average costs of cases in MS–DRGs 163, 164, and 165. Our clinical advisors also agree that these procedures clinically align with the other procedures that are currently assigned to MS–DRGs 163, 164, and 165. We refer the reader to Table 6P.2c associated with this proposed rule for the list of procedure codes we are proposing for reassignment from MS–DRGs 166, 167, and 168 to MS–DRGs 163, 164, and 165 in MDC 04.

After this initial review of all the procedures currently assigned to MS–DRGs 163, 164, 165, 166, 167, and 168, in combination with the results of the data analysis as reflected in Tables 6P.1e and 6P.1f, our clinical advisors support a phased restructuring of these MS–DRGs. We believe further analysis of the procedures assigned to these MS–DRGs is warranted based on the creation of new procedure codes that have been assigned to these MS–DRGs in recent years for which claims data are not yet available and the need for additional time to examine the procedures currently assigned to those MS–DRGs by clinical intensity, complexity of service and resource utilization. We will continue to evaluate the procedures assigned to these MS–DRGs as additional claims data become available.

5. MDC 05 (Diseases and Disorders of the Circulatory System)

a. Short-Term External Heart Assist Device

Impella® Ventricular Support Systems are temporary heart assist devices intended to support blood pressure and provide increased blood flow to critical organs in patients with cardiogenic shock, by drawing blood out of the heart and pumping it into the aorta, partially or fully bypassing the left ventricle to provide adequate circulation of blood (replace or supplement left ventricle pumping) while also allowing damaged heart muscle the opportunity to rest and recover in patients who need short-term support for up to 6 days. The ICD–10–PCS codes that describe the insertion of Impella® heart assist devices are

currently assigned to MS–DRG 215 (Other Heart Assist System Implant). We refer the reader to the ICD–10 MS–DRG Definitions Manual Version 38.1, which is available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software* for complete documentation of the GROUPER logic for MS–DRG 215.

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41159 through 41170), we discussed public comments that recommended that CMS continue to monitor the data in MS–DRG 215 for future consideration of distinctions (for example, different approaches and evolving technologies) that may impact the clinical and resource use of procedures utilizing heart assist devices. Our data analysis showed a wide range in the average length of stay and the average costs for cases reporting procedures that involve a biventricular short-term external heart assist system versus a short-term external heart assist system. We noted we were aware that the AHA published Coding Clinic advice that clarified coding and reporting for certain external heart assist devices due to the technology being approved for new indications but the claims data current at that time did not yet reflect that updated guidance. We also noted that there had been recent updates to the descriptions of the codes for heart assist devices. The qualifier ''intraoperative'' was added effective October 1, 2017 (FY 2018) to the procedure codes describing the insertion of short-term external heart assist system procedures to distinguish between procedures where the device was only used intraoperatively and was removed at the conclusion of the procedure versus procedures where the device was not removed at the conclusion of the procedure and for which that qualifier would not be reported. We agreed with the commenters that continued monitoring of the data and further analysis was necessary prior to proposing any modifications to MS–DRG 215 and finalized our proposal to maintain the current structure of MS–DRG 215 for FY 2019.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42167) we discussed public comments on our proposals related to recalibration of the FY 2020 relative weights and the changes in relative weights from FY 2019. Several commenters expressed concern about significant reductions to the relative weight for MS–DRG 215. Commenters stated that the reduction in the proposed relative weight was 29 percent, the largest decrease of any MS–DRG; commenters also noted that the cumulative decrease to the relative weight for MS–DRG 215 would be 43 percent since FY 2017. Commenters stated that the proposed relative weights would result in significant underpayments to facilities, which would in turn limit access to heart assist devices. After reviewing the comments received and the data used in our ratesetting calculations, we acknowledged an outlier circumstance where the weight for a MS–DRG was seeing a significant reduction for each of the 3 years since CMS began using the ICD–10 data in calculating the relative weights. Therefore, for the reasons discussed in the FY 2020 final rule, we adopted a temporary one-time measure for FY 2020 where the FY 2020 relative weight was set equal to the FY 2019 relative weight, which in turn had been set equal to the FY 2018 relative weight.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58598) we again acknowledged an outlier circumstance where the weight for MS–DRG 215 was seeing a significant reduction for each of the 4 years since CMS began using the ICD–10 data in calculating the relative weights. We stated while we would ordinarily consider this weight change to be appropriately driven by the underlying data, given the comments received, and in an abundance of caution because this may be the MS–DRG assigned when a hospital provides temporary right ventricular support for up to 14 days in critical care patients for the treatment of acute right heart failure or decompensation caused by complications related to COVID–19, including pulmonary embolism, we adopted a temporary one-time measure for FY 2021 for MS–DRG 215. Specifically, we set the 2021 relative weight for MS–DRG 215 equal to the average of the FY 2020 relative weight and the otherwise applicable FY 2021 weight.

For this FY 2022 IPPS/LTCH PPS proposed rule, we received a request to reassign certain cases reporting procedure codes describing the insertion of a percutaneous short-term external heart assist device from MS–DRG 215 to MS–DRGs 216, 217, and 218 (Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively). According to the requestor, there are two distinct clinical populations within MS–DRG 215: High-risk Percutaneous Coronary Intervention (PCI) patients receiving short term ''intraoperative'' external heart assist systems where the device is only used intraoperatively and is removed at the conclusion of the procedure, and those patients in or at risk of cardiogenic shock requiring longer heart pump support and ICU stays. The requestor stated that cases in which short-term external heart assist systems are placed intraoperatively require fewer resources. The requestor suggested that moving the less resource intensive cases that report a procedure code that describes the intraoperative insertion of short-term external heart assist systems from MS–DRG 215 into MS–DRG 216, 217, and 218, will clinically align the two distinctly different patient populations, and consequently will address the potential decrease in the relative weight of MS–DRG 215.

The requestor stated it performed its own analysis of claims in MS–DRG 215 that involve the intraoperative insertion of a short-term external heart assist device (as identified by the presence of ICD–10–PCS codes 02HA3RJ (Insertion of short-term external heart assist system into heart, intraoperative, percutaneous approach) and 5A0221D (Assistance with cardiac output using impeller pump, continuous). The requestor stated that its analysis found that if procedures involving intraoperative placement of a short-term external heart assist device were moved into MS–DRGs 216, 217 and 218, it would result in an increase in the average costs and average lengths of stay for the cases that would remain to be assigned to MS–DRG 215.

During our review of this issue, we noted that when a patient is admitted and has an Impella® external heart assist device inserted two ICD–10–PCS codes are assigned: A code that describes the insertion of the device and code 5A0221D that describes assistance with an impeller pump. Therefore, our analysis included procedure code 02HA3RJ as identified by the requestor as well as similar procedure codes 02HA0RJ (Insertion of short-term external heart assist system into heart, intraoperative, open approach) and 02HA4RJ (Insertion of short-term external heart assist system into heart, intraoperative, percutaneous endoscopic approach) that also describe the intraoperative insertion of a short-term heart assist device, differing only in approach. Because the assistance with an Impella® is coded with ICD–10–PCS code 5A0221D whether the device is used only intraoperatively or in instances where the device is left in place at the conclusion of the procedure, we did not include this code in our analysis. We also note that the requestor suggested that the cases reporting a procedure code describing

the intraoperative insertion of a short-term external heart assist device be moved to MS–DRGs 216, 217 and 218 but these MS–DRGs are defined by the performance of cardiac catheterization. Therefore, we expanded our analysis to also include MS–DRGs 219, 220 and 221 (Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively).

First, we examined claims data from the March 2020 update of the FY 2019 MedPAR file for MS–DRG 215 to identify cases reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ and a procedure code describing the performance of a cardiac catheterization. Our findings are shown in the following table:

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
215	All cases	7,741	7.8	$68,234
	All intraoperative short-term external heart assist devices with cardiac catheterization	2,943	7.1	$60,449
	02HA0RJ with cardiac catheterization	23	8.9	$85,806
	02HA3RJ with cardiac catheterization	2,904	7.1	$60,227
	02HA4RJ with cardiac catheterization	16	6.4	$64,217

As shown in the table, we identified a total of 7,741 cases within MS–DRG 215 with an average length of stay of 7.8 days and average costs of $68,234. Of these 7,741 cases, there are 2,943 cases that include both a procedure code describing the intraoperative insertion of a short-term external heart assist device and a procedure code describing the performance of a cardiac catheterization with an average length of stay of 7.1 days and average costs of $60,449. Of these 2,943 cases, there are 23 cases reporting a procedure code describing the open intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization with an average length of stay of 8.9 days and average costs of $85,806. There are 2,904 cases reporting a procedure code describing a percutaneous intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization with an average length of stay of 7.1 days and average costs of $60,227. There are 16 cases reporting a procedure code describing a percutaneous endoscopic intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization approach with an average length of stay of 6.4 days and average costs of $64,217. The data analysis shows that for the cases in MS–DRG 215 reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ with a procedure code describing the performance of a cardiac catheterization, generally, the average length of stay is shorter and the average costs are lower than the average length of stay and average costs (with the exception of the average costs and length of stay for the 23 cases reporting a procedure code describing the open intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization which are higher) compared to all cases in that MS–DRG.

We also examined claims data from the March 2020 update of the FY 2019 MedPAR file for MS–DRGs 216, 217 and 218. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
216	5,603	16.7	$74,413
217	1,885	9.5	$47,159
218	210	6.6	$37,778

Because MS–DRG 215 is a base DRG and there is a three-way split within MS–DRGs 216, 217, and 218, we also analyzed the cases reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization for the presence or absence of a secondary diagnosis designated as a complication or comorbidity (CC) or a major complication or comorbidity (MCC).

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
215	02HA0RJ, 02HA3RJ or 02HA4RJ with cardiac catheterization with MCC	1,886	9	$66,524
	02HA0RJ, 02HA3RJ or 02HA4RJ with cardiac catheterization with CC	778	4.1	$49,481
	02HA0RJ, 02HA3RJ or 02HA4RJ with cardiac catheterization without CC/MCC	278	2.5	$49,942

This data analysis shows the cases in MS–DRG 215 reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ with a procedure code describing the performance of a cardiac catheterization when distributed based on the presence or absence of a secondary diagnosis designated as a complication or comorbidity (CC) or a major complication or comorbidity (MCC) have average costs generally more similar to the average costs in the FY 2019 MedPAR file for MS–DRGs 216, 217 and 218 respectively, while the average lengths of stay are shorter. While the cases from MS–DRG 215 reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization ''with CC'' and ''without CC/MCC'' have higher average costs than the average costs of MS–DRGs 217 and 218, these costs are closer to the average costs of those MS–DRGs than they are to the average costs of MS–DRG 215. The average costs of the cases from MS–DRG 215 reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization ''with MCC'' are lower than the average costs of both MS–DRGs 215 and 216.

Next, we examined claims data from the March 2020 update of the FY 2019 MedPAR file for MS–DRG 215 to identify cases reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ without a procedure code describing the performance of a cardiac catheterization. Our findings are shown in the following table:

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
215	All cases	7,741	7.8	$68,234
	All intraoperative short-term external heart assist devices without cardiac catheterization	432	4.8	$53,607
	02HA0RJ without cardiac catheterization	8	8.8	$141,242
	02HA3RJ without cardiac catheterization	423	4.7	$51,964
	02HA4RJ without cardiac catheterization	1	2	$47,289

As shown in the table, of the 7,741 cases within MS–DRG 215, there are 432 cases that include a procedure code describing the intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization with an average length of stay of 4.8 days and average costs of $53,607. Of these 432 cases, there are eight cases reporting a procedure code describing the open intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization with an average length of stay of 8.8 days and average costs of $141,242. There are 423 cases reporting a procedure code describing a percutaneous intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization with an average length of stay of 4.7 days and average costs of $51,964. There is one case reporting a procedure code describing a percutaneous endoscopic intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization approach with a length of stay of 2 days and costs of $47,289. The data analysis shows that for the cases in MS–DRG 215 reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ without a

procedure code describing the performance of a cardiac catheterization, generally, the average length of stay is shorter and the average costs are lower than the average length of stay and average costs (with the exception of the average costs and length of stay for the eight cases describing the open intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization which are higher) compared to all cases in that MS–DRG.

We also examined claims data from the March 2020 update of the FY 2019 MedPAR file for MS–DRGs 219, 220 and 221. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
219	15,597	10.9	$57,845
220	15,074	6.5	$39,565
221	2,417	4.5	$33,560

Similarly, because MS–DRG 215 is a base DRG and there is a three-way split within MS–DRGs 219, 220 and 221, we also analyzed the cases reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization for the presence or absence of a secondary diagnosis designated as a complication or comorbidity (CC) or a major complication or comorbidity (MCC).

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
215	02HA0RJ, 02HA3RJ or 02HA4RJ without cardiac catheterization with MCC	205	7.3	$60,274
	02HA0RJ, 02HA3RJ or 02HA4RJ without cardiac catheterization with CC	158	2.7	$46,745
	02HA0RJ, 02HA3RJ or 02HA4RJ without cardiac catheterization without CC/MCC	68	1.4	$41,050

This data analysis shows the cases in MS–DRG 215 reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ without a procedure code describing the performance of a cardiac catheterization when distributed based on the presence or absence of a secondary diagnosis designated as a complication or comorbidity (CC) or a major complication or comorbidity (MCC) have average costs generally more similar to the average costs in the FY 2019 MedPAR file for MS–DRGs 219, 220 and 221 respectively, while the average lengths of stay are shorter. While the cases from MS–DRG 215 reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device, without a procedure code describing the performance of a cardiac catheterization ''with MCC'', ''with CC'' and ''without CC/MCC'' have higher average costs than the average costs MS–DRGs 219, 220 and 221, respectively, these costs are closer to the average costs of those MS–DRGs than they are to the average costs of MS–DRG 215.

We also examined claims data from the September 2020 update of the FY 2020 MedPAR file for MS–DRG 215 to identify cases reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ with a procedure code describing the performance of a cardiac catheterization. Our findings are shown in the following table:

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
215	All cases	6,275	7.9	$72,144
	All intraoperative short-term external heart assist devices with cardiac catheterization	2,395	6.8	$62,260
	02HA0RJ with cardiac catheterization	25	8.2	$85,954
	02HA3RJ with cardiac catheterization	2,360	6.8	$61,965
	02HA4RJ with cardiac catheterization	10	6.9	$72,564

As shown in the table, we identified a total of 6,275 cases within MS–DRG 215 with an average length of stay of 7.9 days and average costs of $72,144. Of these 6,275 cases, there are 2,395 cases that include both a procedure code describing the intraoperative insertion of a short-term external heart assist device and a procedure code describing the performance of a cardiac catheterization with an average length of stay of 6.8 days and average costs of $62,260. Of these 2,395 cases, there were 25 cases reporting a procedure code describing the open intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization with an average length of stay of 8.2 days and average costs of $85,954. There are 2,360 cases reporting a procedure code describing a percutaneous intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization with an average length of stay of 6.8 days and average costs of $61,965. There are 10 cases reporting a procedure code describing a percutaneous endoscopic intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization approach with an average length of stay of 6.9 days and average costs of $72,564. The data analysis shows that for the cases in MS–DRG 215 reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ with a procedure code describing the performance of a cardiac catheterization, when examined collectively, the average length of stay is shorter (6.8 days versus 7.9 days) and the average costs are lower ($62,260 versus $72,144) than the average length of stay and average costs (of all cases in that MS–DRG). There were some differences noted in cases reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization when examined by operative approach. For the 25 cases reporting a procedure code describing the open intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization, the average costs were higher ($85,954 versus $72,144) and average length of stay was slightly longer (8.2 days versus 7.9 days) when compared to all cases in that MS–DRG. For the 10 cases reporting a procedure code describing the percutaneous endoscopic intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization, the average costs were nearly equal ($72,564 versus $72,144) and average length of stay was shorter (6.9 days versus 7.9 days) when compared to all cases in that MS–DRG.

We also examined claims data from the September 2020 update of the FY 2020 MedPAR file for MS–DRGs 216, 217 and 218. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
216	4,279	16.5	$79,786
217	1,310	9.4	$49,109
218	121	6.6	$43,504

Because MS–DRG 215 is a base DRG and there is a three-way split within MS–DRGs 216, 217, and 218, we also analyzed the cases reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization for the presence or absence of a secondary diagnosis designated as a complication or comorbidity (CC) or a major complication or comorbidity (MCC).

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
215	02HA0RJ, 02HA3RJ or 02HA4RJ with cardiac catheterization with MCC	1,522	8.7	$68,543
	02HA0RJ, 02HA3RJ or 02HA4RJ with cardiac catheterization with CC	632	3.8	$51,908
	02HA0RJ, 02HA3RJ or 02HA4RJ with cardiac catheterization without CC/MCC	241	2.5	$49,726

This data analysis shows the cases in MS–DRG 215 reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ with a procedure code describing the performance of a cardiac catheterization when distributed based on the presence or absence of a secondary diagnosis designated as a complication or comorbidity (CC) or a major complication or comorbidity (MCC) have average costs generally more similar to the average costs in the FY 2020 MedPAR file for MS–DRGs 216, 217 and 218 respectively, while the average lengths of stay are shorter. While the cases from MS–DRG 215 reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization ''with CC'' and ''without CC/MCC'' have higher average costs than the average costs of MS–DRGs 217 and 218, these costs are closer to the average costs of those MS–DRGs than they are to the average costs of MS–DRG 215. The average costs of the cases from MS–DRG 215 reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device with a procedure code describing the performance of a cardiac catheterization ''with MCC'' are lower than the average costs of both MS–DRGs 215 and 216.

Next, we examined claims data from the September 2020 update of the FY 2020 MedPAR file for MS–DRG 215 to identify cases reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ without a procedure code describing the performance of a cardiac catheterization. Our findings are shown in the following table:

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
215	All cases	6,275	7.9	$72,144
	All intraoperative short-term external heart assist devices without cardiac catheterization	331	4.5	$52,181
	02HA0RJ without cardiac catheterization	8	8.9	$80,314
	02HA3RJ without cardiac catheterization	322	4.4	$51,569
	02HA4RJ without cardiac catheterization	1	2	$24,379

As shown in the table, of the 6,275 cases within MS–DRG 215, there are 331 cases that include a procedure code describing the intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization with an average length of stay of 4.5 days and average costs of $52,181. Of these 331 cases, there are eight cases reporting a procedure code describing the open intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization with an average length of stay of 8.9 days and average costs of $80,314. There are 332 cases reporting a procedure code describing a percutaneous intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization with an average length of stay of 4.4 days and average costs of $51,569. There is one case reporting a procedure code describing a percutaneous endoscopic intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization approach with a length of stay of 2 days and costs of $24,379. The data analysis shows that for the cases in MS–DRG 215 reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ without a

procedure code describing the performance of a cardiac catheterization, generally, the average length of stay is shorter and the average costs are lower than the average length of stay and average costs (with the exception of the average costs and length of stay for the eight cases reporting a procedure code describing the open intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization which are higher) compared to all cases in that MS–DRG.

We also examined claims data from the September 2020 update of the FY 2020 MedPAR file for MS–DRGs 219, 220 and 221. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
219	11,863	10.9	$61,934
220	10,072	6.5	$41,800
221	1,440	4.2	$36,242

Similarly, because MS–DRG 215 is a base DRG and there is a three-way split within MS–DRGs 219, 220 and 221, we also analyzed the 331 cases reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization for the presence or absence of a secondary diagnosis designated as a complication or comorbidity (CC) or a major complication or comorbidity (MCC).

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
215	02HA0RJ, 02HA3RJ or 02HA4RJ without cardiac catheterization with MCC	161	6.5	$57,285
	02HA0RJ, 02HA3RJ or 02HA4RJ without cardiac catheterization with CC	103	3	$47,996
	02HA0RJ, 02HA3RJ or 02HA4RJ without cardiac catheterization without CC/MCC	67	1.7	$46,352

This data analysis shows the cases in MS–DRG 215 reporting ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ without a procedure code describing the performance of a cardiac catheterization when distributed based on the presence or absence of a secondary diagnosis designated as a complication or comorbidity (CC) or a major complication or comorbidity (MCC) have average costs generally more similar to the average costs in the FY 2020 MedPAR file for MS–DRGs 219, 220 and 221 respectively, while the average lengths of stay are shorter. While the cases from MS–DRG 215 reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization ''with CC'' and ''without CC/MCC'' have higher average costs than the average costs of MS–DRGs 220 and 221, these costs are closer to the average costs of those MS–DRGs than they are to the average costs of MS–DRG 215. The average costs of the cases from MS–DRG 215 reporting a procedure code describing the intraoperative insertion of a short-term external heart assist device without a procedure code describing the performance of a cardiac catheterization ''with MCC'' are lower than the average costs of both MS–DRGs 215 and 219.

Our clinical advisors reviewed the clinical issues and the claims data and agreed that cases reporting a procedure code that describes the intraoperative insertion of a short-term external heart assist device are generally less resource intensive and are clinically distinct from other cases reporting procedure codes describing the insertion of other types of heart assist devices currently assigned to MS–DRG 215. Our clinical advisors state that critically ill patients who are experiencing or at risk for cardiogenic shock from an emergent event such as heart attack or virus that impacts the functioning of the heart and requires longer heart pump support are different from those patients who require intraoperative support only. Patients receiving a short-term external heart assist device intraoperatively during coronary interventions often have an underlying disease pathology such as heart failure related to occluded coronary vessels that is broadly similar in kind to other patients also receiving these interventions without the need for an insertion of a short-term external heart assist device. In the post-operative period, these patients can recover and can be sufficiently rehabilitated prior to discharge. For these reasons, our clinical advisors support reassigning

ICD–10–PCS codes 02HA0RJ, 02HA3RJ, and 02HA4RJ that describe the intraoperative insertion of a short-term external heart assist device to MS–DRGs 216, 217, 218, 219, 220 and 221 in MDC 05. They stated this reassignment would improve clinical coherence in these MS–DRGs.

To compare and analyze the impact of our suggested modifications, we ran a simulation using the Version 38.1 ICD–10 MS–DRG GROUPER and the claims data from the March 2020 update of the FY 2019 MedPAR file. The following table reflects our simulation for ICD–10–PCS procedure codes 02HA0RJ, 02HA3RJ or 02HA4RJ that describe the intraoperative insertion of a short-term external heart assist device if they were moved to MS–DRGS 216, 217, 218, 219, 220 and 221.

MS-DRG		Number of Cases	Average Length of Stay	Average Cost
215	All Cases	7,741	7.8	$68,234
	without 02HA0RJ, 02HA3RJ or 02HA4RJ	4,798	8.2	$73,009
216	All Cases	5,603	16.7	$74,413
	with 02HA0RJ, 02HA3RJ or 02HA4RJ	7,490	14.8	$72,424
217	All Cases	1,885	9.5	$47,159
	with 02HA0RJ, 02HA3RJ or 02HA4RJ	2,663	7.9	$47,837
218	All Cases	210	6.6	$37,778
	with 02HA0RJ, 02HA3RJ or 02HA4RJ	488	4.3	$44,708
219	All Cases	15,597	10.9	$57,845
	with 02HA0RJ, 02HA3RJ or 02HA4RJ	17,484	10.7	$58,781
220	All Cases	15,074	6.5	$39,565
	with 02HA0RJ, 02HA3RJ or 02HA4RJ	15,852	6.4	$40,052
221	All Cases	2,417	4.5	$33,560
	with 02HA0RJ, 02HA3RJ or 02HA4RJ	2,695	4.3	$35,250

We believe the resulting proposed MS–DRG assignments would be more clinically homogeneous, coherent and better reflect hospital resource use while at the same time addressing concerns related to the relative weight of MS–DRG 215. A review of this simulation shows that this distribution of ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ that describe the intraoperative insertion of a short-term external heart assist device if moved to MS–DRGs 216, 217, 218, 219, 220 and 221, increases the average costs of the cases remaining in MS–DRG 215 by over $4,500, while generally having a more limited effect on the average costs of MS–DRGs 216, 217, 218, 219, 220 and 221.

We also ran a simulation using the Version 38.1 ICD–10 MS–DRG GROUPER and the claims data from the September 2020 update of the FY 2020 MedPAR file. The following table reflects our simulation for ICD–10–PCS procedure codes 02HA0RJ, 02HA3RJ or 02HA4RJ that describe the intraoperative insertion of a short-term external heart assist device if they were moved to MS–DRGS 216, 217, 218, 219, 220 and 221.

MS-DRG		Number of Cases	Average Length of Stay	Average Cost
	All Cases	6,275	7.9	$72,144
215	without 02HA0RJ, 02HA3RJ or 02HA4RJ	3,880	8.6	$78,245
	All Cases	4,279	16.5	$79,786
216	with 02HA0RJ, 02HA3RJ or 02HA4RJ	5,801	14.5	$76,835
	All Cases	1,310	9.4	$49,109
217	with 02HA0RJ, 02HA3RJ or 02HA4RJ	1,942	7.6	$50,020
	All Cases	121	6.6	$43,504
218	with 02HA0RJ, 02HA3RJ or 02HA4RJ	362	3.8	$47,646
	All Cases	11,863	10.9	$61,934
219	with 02HA0RJ, 02HA3RJ or 02HA4RJ	13,385	10.7	$62,685
	All Cases	10,072	6.5	$41,800
220	with 02HA0RJ, 02HA3RJ or 02HA4RJ	10,704	6.3	$42,397
	All Cases	1,440	4.2	$36,242
221	with 02HA0RJ, 02HA3RJ or 02HA4RJ	1,681	4.0	$38,175

As with our simulation based on the March 2020 update of the FY 2019 MedPAR file, we believe that this simulation supports that the resulting proposed MS–DRG assignments would be more clinically homogeneous, coherent and better reflect hospital resource use while at the same time addressing concerns related to the relative weight of MS–DRG 215. A review of this simulation shows that this distribution of ICD–10–PCS codes 02HA0RJ, 02HA3RJ or 02HA4RJ that describe the intraoperative insertion of a short-term external heart assist device if moved to MS–DRGs 216, 217, 218, 219, 220 and 221, increases the average costs of the cases remaining in MS–DRG 215 by over $6,000, while generally having a more limited effect on the average costs of MS–DRGS 216, 217, 218, 219, 220 and 221.

Therefore, for FY 2022, we are proposing to reassign ICD–10–PCS codes 02HA0RJ, 02HA3RJ, and 02HA4RJ from MDC 05 in MS–DRG 215 to MS–DRGs 216, 217, 218, 219, 220 and 221 in MDC 05.

b. Type II Myocardial Infarction

We received a request to review the MS–DRG assignment of ICD–10–CM diagnosis code I21.A1 (Myocardial infarction type 2). The requestor stated that when a type 2 myocardial infarction is documented, per coding guidelines, it is to be coded as a secondary diagnosis since it is due to an underlying cause. This requestor also noted that when a type 2 myocardial infarction is coded with a principal diagnosis in MDC 05 (Diseases and Disorders of the Circulatory System), the GROUPER logic assigns MS–DRGs 280 through 282 (Acute Myocardial Infarction, Discharged Alive with MCC, with CC, and without CC/MCC, respectively). The requestor questioned if this GROUPER logic was correct or if the logic should be changed so that a type 2 myocardial infarction, coded as a secondary diagnosis, does not result in the assignment of a MS–DRG that describes an acute myocardial infarction.

To begin our analysis, we reviewed the GROUPER logic. The requestor is correct that when diagnosis code I21.A1 is reported as a secondary diagnosis in combination with a principal diagnosis in MDC 05, the case currently groups to medical MS–DRGs 280 through 282 in the absence of a surgical procedure, when the patient is discharged alive. We note that if the patient expires, GROUPER logic instead will assign MS–DRGs 283 through 285 (Acute Myocardial Infarction, Expired with MCC, with CC, and without CC/MCC, respectively) when diagnosis code I21.A1 is reported as a secondary diagnosis in combination with a principal diagnosis in MDC 05.

According to the Universal Definition of Myocardial Infarction (MI), developed by a global task force that included the European Society of Cardiology, the American College of Cardiology, the American Heart Association and the World Heart Federation (WHF), the diagnosis of MI requires the rise and/or fall of cardiac biomarkers with clinical evidence of ischemia in which there is evidence of myocardial injury or necrosis, defined by symptoms, electrocardiographic (ECG) changes, or new regional wall motion abnormalities. Since 2007, this definition further classifies myocardial infarctions into five distinct subtypes. While a type 1 MI is defined as a MI due to an acute coronary syndrome, type 2 MI is defined as a mismatch in myocardial oxygen supply and demand due to other causes such as coronary dissection, vasospasm, emboli, or hypotension that is not attributed to unstable coronary artery disease (CAD).

Our clinical advisors reviewed this issue and do not recommend changing the current MS–DRG assignment of ICD–10–CM diagnosis code I21.A1. As noted by the requestor, the ICD–10–CM Official Guidelines for Coding and Reporting state ''Type 2 myocardial infarction, (myocardial infarction due to demand ischemia or secondary to ischemic imbalance) is assigned to code I21.A1, Myocardial infarction type 2 with a code for the underlying cause coded first.'' Our clinical advisors believe that cases reporting diagnosis code I21.A1 as a secondary diagnosis are associated with a severity of illness on par with cases reporting a principal diagnosis of another type myocardial infarction. They state the diagnosis of myocardial infarction describes myocardial cell death due to inadequate

oxygen supply to the myocardium for a prolonged period, regardless of the subtype. Our clinical advisors state, for clinical consistency, it is more appropriate to maintain the current assignment of ICD–10–CM diagnosis code I21.A1 with the other codes that describe myocardial infarction. Therefore, we are not proposing to reassign diagnosis code I21.A1 from MS–DRGs 280 through 285.

During our review of this issue we noted that code I21.A1 (Myocardial infarction type 2) is currently one of the listed principal diagnoses in the GROUPER logic for MS–DRGs 222 and 223 (Cardiac Defibrillator Implant with Cardiac Catheterization with AMI, HF or Shock with and without MCC, respectively). However, code I21.A1 is not currently recognized in these same MS–DRGs when coded as a secondary diagnosis. As a result, when coded as a secondary diagnosis in combination with a principal diagnosis in MDC 05, MS–DRGs 224 and 225 (Cardiac Defibrillator Implant with Cardiac Catheterization without AMI, HF, or Shock with and without MCC, respectively) are instead assigned when reported with a listed procedure code. We refer the reader to the ICD–10 MS–DRG Definitions Manual Version 38.1, which is available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software* for complete documentation of the GROUPER logic for MS–DRGs 222, 223, 224, and 225.

Acknowledging that coding guidelines instruct to code I21.A1 after the diagnosis code that describes the underlying cause, our clinical advisors recommend adding special logic in MS–DRGs 222 and 223 to have code I21.A1 also qualify when coded as a secondary diagnosis in combination with a principal diagnosis in MDC 05 since these diagnosis code combinations also describe acute myocardial infarctions.

As a result, we are proposing modifications to the GROUPER logic to allow cases reporting diagnosis code I21.A1 (Myocardial infarction type 2) as a secondary diagnosis to group to MS–DRGs 222 and 223 when reported with a listed procedure code for clinical consistency with the other MS–DRGs describing acute myocardial infarction.

A diagnosis code may define the logic for a specific MS–DRG assignment in three different ways. The diagnosis code may be listed as principal or as any one of the secondary diagnoses, as a secondary diagnosis, or only as a secondary diagnosis as noted in more detail in this proposed rule.

- *Principal or secondary diagnoses.* Indicates that a specific set of diagnoses are used in the definition of the MS–DRG. The diagnoses may be listed as principal or as any one of the secondary diagnoses. A special case of this condition is MS–DRG 008 in which two diagnoses (for example, renal and diabetic) must both be present somewhere in the list of diagnoses in order to be assigned to MS–DRG 008.
- *Secondary diagnoses.* Indicates that a specific set of secondary diagnoses are used in the definition of the MS–DRG. For example, a secondary diagnosis of acute leukemia with chemotherapy is used to define MS–DRG 839.
- *Only secondary diagnoses.* Indicates that in order to be assigned to the specified MS–DRG no secondary diagnoses other than those in the specified list may appear on the patient's record. For example, in order to be assigned to MS–DRG 795, only secondary diagnoses from the specified list may appear on the patient's record.

We note that whenever there is a secondary diagnosis component to the MS–DRG logic, the diagnosis code can either be used in the logic for assignment to the MS–DRG or to act as a CC/MCC. For this specific scenario, we propose that code I21.A1, as a secondary diagnosis, be used in the definition of the logic for assignment to MS–DRGs 222 and 223, similar to the example described previously, where a secondary diagnosis of acute leukemia with chemotherapy is used to define MS–DRG 839, and therefore will not act as a MCC in these MS–DRGs.

In summary, for FY 2022, we are proposing to maintain the current structure of MS–DRGs 280 through 285. We are also proposing to modify the GROUPER logic to allow cases reporting diagnosis code I21.A1 (Myocardial infarction type 2) as a secondary diagnosis to group to MS–DRGs 222 and 223 when reported with qualifying procedures.

c. Viral Cardiomyopathy

We received three separate but related requests to add ICD–10–CM diagnosis code B33.24 (Viral cardiomyopathy) to the list of principal diagnoses for MS–DRGs 314, 315, and 316 (Other Circulatory System Diagnoses with MCC, with CC, and without CC/MCC, respectively) in MDC 05. The requestors noted that a discontinuity exists in the current MDC assignment of diagnosis codes in ICD–10–CM subcategory B33.2. The list of the five ICD–10–CM diagnosis codes in subcategory B33.2, as well as their current MDC assignments, is found in the following table.

ICD-10-CM Code	Code Description	MDC
B33.20	Viral carditis, unspecified	05
B33.21	Viral endocarditis	05
B33.22	Viral myocarditis	05
B33.23	Viral pericarditis	05
B33.24	Viral cardiomyopathy	18

A requestor noted ICD–10–CM codes B33.20, B33.21, B33.22, and B33.23 are assigned to MDC 05 (Diseases and Disorders of the Circulatory System), while code B33.24 is assigned to MDC 18 (Infectious and Parasitic Diseases, Systemic or Unspecified Sites). The requestor stated that the placement of ICD–10–CM diagnosis code B33.24 within subcategory B33.2 is clinically appropriate, as all the diagnoses within this subcategory share a common etiology, involve the heart and supporting structures, and require the same intensity of hospital care. However, the assignment of code B33.24 to a different MDC is clinically incongruous with the placement of the other codes in the subcategory. According to the requestor, all of the conditions share similar etiology, anatomic location, and needs for care, therefore the five codes should all be assigned to MDC 05. This requestor also stated that reassigning code B33.24 to MDC 05 would ensure both clinical continuity and coding consistency within the B33.2 subcategory. Another requestor stated MDC 05 surgical MS–DRGs should be assigned when

procedures such as cardiac catheterization or coronary angioplasty are performed for a principal diagnosis of viral cardiomyopathy.

To begin our analysis, we reviewed the GROUPER logic. Currently, cases reporting ICD–10–CM diagnosis code B33.24 as a principal diagnosis group to medical MS–DRGs 865 and 866 (Viral Illness with and without MCC, respectively) in MDC 18 in the absence of a surgical procedure. Our clinical advisors reviewed this issue and noted viral cardiac infections may present as endocarditis (inflammation of the heart's inner lining), myocarditis (inflammation of the middle layer of the heart), pericarditis (inflammation of the pericardium), or cardiomyopathy (disease of the heart muscle). The infection usually begins somewhere other than the heart, often in the nose, lungs, or stomach. As the infection progresses, and the microbe multiplies and gets into the bloodstream, it can infiltrate the heart muscle. The growth and replication of viruses inside the heart can endanger the heart by destroying heart cells. The management of viral cardiomyopathy is similar to the management of other viral cardiac infections and can include bed rest, control of pain with non-steroidal anti-inflammatory agents and anti-microbial therapy to avoid permanent myocardial damage, cardiomegaly, and/or congestive cardiac failure.

Our clinical advisors agree that the diagnosis of viral cardiomyopathy is clinically related to the other diagnoses in ICD–10–CM subcategory B33.2. They believe it is clinically appropriate for all five diagnoses in subcategory B33.2 to group to MDC 05 (Diseases and Disorders of the Circulatory System) as these conditions describe circulatory system conditions and complications and that this modification will improve clinical coherence. Therefore, we are proposing to reassign ICD–10–CM diagnosis code B33.24 from MDC 18 in MS DRGs 865 and 866 (Viral Illness with and without MCC, respectively) to MDC 05 in MS DRGs 314, 315, and 316 (Other Circulatory System Diagnoses with MCC, with CC, and without CC/MCC, respectively). Under this proposal, cases reporting procedure codes from MDC 05 in conjunction with principal diagnosis B33.24, would group to MS–DRGs in MDC 05.

d. Left Atrial Appendage Closure (LAAC)

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58471 through 58477), we identified nine ICD–10–PCS procedure codes that describe Left Atrial Appendage Closure (LAAC) procedures and noted their corresponding MS–DRG assignments in the ICD–10 MS–DRGs Version 37 as listed in the following table.

ICD-10-PCS Code	MS-DRG	Description
02L70CK	250-251	Occlusion of left atrial appendage with extraluminal device, open approach
02L70DK	250-251	Occlusion of left atrial appendage with intraluminal device, open approach
02L70ZK	250-251	Occlusion of left atrial appendage, open approach
02L73CK	273-274	Occlusion of left atrial appendage with extraluminal device, percutaneous approach
02L73DK	273-274	Occlusion of left atrial Appendage with intraluminal device, percutaneous approach
02L73ZK	273-274	Occlusion of left atrial appendage, percutaneous approach
02L74CK	273-274	Occlusion of left atrial appendage with extraluminal device, percutaneous endoscopic approach
02L74DK	273-274	Occlusion of left atrial appendage with intraluminal device, percutaneous endoscopic approach
02L74ZK	273-274	Occlusion of left atrial appendage, percutaneous endoscopic approach

As discussed in the FY 2021 IPPS/LTCH PPS final rule, we examined claims data from the September 2019 update of the FY 2019 MedPAR file for cases reporting LAAC procedures with an open approach in MS–DRGs 250 and 251 (Percutaneous Cardiovascular Procedures without Coronary Artery Stent with and without MCC, respectively). Our analysis showed that the cases reporting a LAAC procedure with an open approach in MS–DRGs 250 and 251 had higher average costs and longer average length of stay compared to all cases in MS–DRGs 250 and 251. We also stated our clinical advisors believed that ICD–10–PCS codes 02L70CK, 02L70DK, and 02L70ZK that describe a LAAC procedure with an open approach were more suitably grouped to MS–DRGs 273 and 274 (Percutaneous Intracardiac Procedures with and without MCC, respectfully). Therefore, we finalized our proposal to reassign ICD–10–PCS procedure codes 02L70CK, 02L70DK, and 02L70ZK from MS–DRGs 250 and 251 to MS–DRGs 273 and 274. We also finalized a revision to the titles for MS–DRG 273 and 274 to Percutaneous and Other Intracardiac Procedures with and without MCC, respectively to reflect this reassignment for FY 2021.

In response to this final policy, for this FY 2022 IPPS/LTCH PPS proposed rule, we received a request to again review the MS–DRG assignment of cases involving LAAC procedures with an open approach. The requestor disagreed with CMS's FY 2021 IPPS/LTCH PPS final rule decision to move the three procedure codes describing the open occlusion of left atrial appendage to MS–DRGs 273 and 274 (Percutaneous and Other Intracardiac Procedures with and without MCC, respectively). The requestor stated they believe that MS–DRGs 228 and 229 (Other Cardiothoracic Procedures with and without MCC, respectively), would more appropriately correspond with the open procedural resources and longer length of stay expected with open heart procedures.

Our clinical advisors reviewed this request and continue to support the reassignment of ICD–10–PCS procedure

codes 02L70CK, 02L70DK, and 02L70ZK from MS–DRGs 250 and 251 to MS–DRGs 273 and 274 because it allows all LAAC procedures to be grouped together under the same MS–DRGs and improves clinical coherence. Our clinical advisors state open LAAC procedures are primarily performed in the absence of another O.R. procedure and generally are not performed with a more intensive open chest procedure. When performed as standalone procedures, open LAAC procedures share similar factors such as complexity and resource utilization with all other LAAC procedures. Our clinical advisors continue to state our FY 2021 final policy results in MS–DRG assignments that are more clinically homogeneous and better reflect hospital resource use. Therefore, we are proposing to maintain the assignment of codes 02L70CK, 02L70DK, and 02L70ZK that describe the open occlusion of the left atrial appendage in MS–DRGs 273 and 274.

e. Surgical Ablation

We received a two-part request to review the MS–DRG assignments for cases involving the surgical ablation procedure for atrial fibrillation. Atrial fibrillation (AF) is an irregular and often rapid heart rate that occurs when the two upper chambers of the heart experience chaotic electrical signals. AF presents as either paroxysmal (lasting <7 days), persistent (lasting >7 days, but less than 1 year), or long standing persistent (chronic) (lasting >1 year) based on time duration and can increase the risk for stroke, heart failure, and mortality. Management of AF has two primary goals: Optimizing cardiac output through rhythm or rate control, and decreasing the risk of cerebral and systemic thromboembolism. Patients that worsen in symptomology or fail to respond to pharmacological treatment or other interventions may be referred for surgical ablation to treat their AF. Surgical ablation is a procedure that works by burning or freezing tissue on the inside of the heart to disrupt faulty electrical signals causing the arrhythmia, which can help the heart maintain a normal heart rhythm.

The first part of this request was to create a new classification of surgical ablation MS–DRGs to better accommodate the costs of open concomitant surgical ablations. According to the requestor, patients undergoing surgical ablation are treated under two potential scenarios: (1) Open concomitant (combination) surgical ablation, meaning open surgical ablation performed during another open-heart surgical procedure such as mitral valve repair or replacement (MVR), aortic valve repair or replacement (AVR), or coronary artery bypass grafting (CABG) and (2) minimally invasive, percutaneous endoscopic, standalone surgical ablation as the sole therapeutic procedure performed. According to the requestor, open concomitant surgical ablation is an efficient procedure, as it allows treatment of AF and another clinical pathology in one procedure thereby decreasing the risk of future readmits, need for future repeat catheter ablation procedures, and patient mortality.

The requestor identified the following potential procedure combinations that would comprise an ''open concomitant surgical ablation'' procedure.

- Open CABG + open surgical ablation
- Open MVR + open surgical ablation
- Open AVR + open surgical ablation
- Open MVR + open AVR + open surgical ablation
- Open MVR + open CABG + open surgical ablation
- Open MVR + open AVR + open CABG + open surgical ablation
- Open AVR + open CABG + open surgical ablation

The requestor performed its own analysis of these procedure code combinations and stated that it found the average costs for open concomitant surgical ablation procedures were consistently higher compared to the average costs within their respective MS–DRGs, which could limit beneficiary access to these procedures.

The requestor suggested that the following four MS–DRGs be created to address the differences in average costs and average lengths of stay it found in its data analysis:

- Suggested New MS–DRG XXX—Open Surgical Ablation with or without Other Cardiothoracic Procedure with Cardiac Catheterization with MCC;
- Suggested New MS–DRG XXX—Open Surgical Ablation with or without Other Cardiothoracic Procedure with Cardiac Catheterization without MCC;
- Suggested New MS–DRG XXX—Open Surgical Ablation with or without Other Cardiothoracic Procedure without Cardiac Catheterization with MCC; and
- Suggested New MS–DRG XXX—Open Surgical Ablation with or without Other Cardiothoracic Procedure without Cardiac Catheterization without MCC.

In reviewing this request, we identified nine ICD–10–PCS codes that describe open surgical ablation. These codes and their corresponding MDC and MS–DRG assignments are listed in the following table.

ICD-10-PCS Code	MDC	MS-DRG	Description
02540ZZ	05	228-229	Destruction of coronary vein, open approach
02550ZZ	05	228-229	Destruction of atrial septum, open approach
02560ZZ	05	228-229	Destruction of right atrium, open approach
02570ZK	05	250-251	Destruction of left atrial appendage, open approach
02570ZZ	05	228-229	Destruction of left atrium, open approach
02580ZZ	05	228-229	Destruction of conduction mechanism, open approach
02590ZZ	05	228-229	Destruction of chordae tendineae, open approach
025S0ZZ	04 05	163-165 270-272	Destruction of right pulmonary vein, open approach
025T0ZZ	04 05	163-165 270-272	Destruction of left pulmonary vein, open approach

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, for open concomitant surgical ablation procedures, the GROUPER logic assigns MS–DRGs 228 and 229 (Other Cardiothoracic Procedures with and without MCC, respectively) in most instances because MS–DRGs 228 and 229 are high in the surgical hierarchy GROUPER logic of MDC 05 (Diseases and Disorders of the Circulatory System). Since patients can have multiple procedures reported with a principal diagnosis during a particular hospital stay, and a patient can be assigned to only one MS–DRG, the surgical hierarchy GROUPER logic provides a hierarchical order of surgical classes from the most resource-intensive to the least resource-intensive. Patients with multiple procedures are generally assigned to the MS–DRG that correlates to the most resource-intensive surgical class.

Our clinical advisors reviewed this grouping issue and noted in open concomitant surgical ablation procedures, the CABG, MVR, and/or AVR components of the procedure are more technically complex than the open surgical ablation procedure. Our clinical advisors stated that in open concomitant surgical ablation procedures, the MS–DRG assigned should be based on the most resource-intensive procedure performed. Therefore, we believe this request would be better addressed by proposing to revise the surgical hierarchy in MDC 05 rather than creating four new MS–DRGs. For FY 2022, we are proposing to revise the surgical hierarchy for the MS–DRGs in MDC 05 to sequence MS–DRGs 231–236 (Coronary Bypass) above MS–DRGs 228 and 229 to enable more appropriate MS–DRG assignment for these types of cases. Under this proposal, if a procedure code describing a CABG and a procedure code describing an open surgical ablation are present, the GROUPER logic would assign the CABG surgical class because a CABG would be sequenced higher in the hierarchy than an open surgical ablation. We refer the reader to section II.D.15. of the preamble of this proposed rule for the discussion of the surgical hierarchy and the complete list of our proposed modifications to the surgical hierarchy in MDC 05.

As mentioned earlier in this section, this request involved two parts. The second part of the request was to reassign cases describing standalone percutaneous endoscopic surgical ablation. According to the requestor, standalone, percutaneous endoscopic surgical ablation is a rapidly growing therapy, indicated for highly symptomatic patients that have already failed medical management and/or percutaneous catheter ablation procedures. The requestor identified nine ICD–10–PCS codes that they stated describe percutaneous endoscopic surgical ablation. These codes and their corresponding MDC and MS–DRG assignments are listed in the following table.

ICD-10-PCS Code	MDC	MS-DRG	Description
02544ZZ	05	228-229	Destruction of coronary vein, percutaneous endoscopic approach
02554ZZ	05	228-229	Destruction of atrial septum, percutaneous endoscopic approach
02564ZZ	05	228-229	Destruction of right atrium, percutaneous endoscopic approach
02574ZK	05	273-274	Destruction of left atrial appendage, percutaneous endoscopic approach
02574ZZ	05	228-229	Destruction of left atrium, percutaneous endoscopic approach
02584ZZ	05	228-229	Destruction of conduction mechanism, percutaneous endoscopic approach
02594ZZ	05	228-229	Destruction of chordae tendineae, percutaneous endoscopic approach
025S4ZZ	04 05	163-165 270-272	Destruction of right pulmonary vein, percutaneous endoscopic approach
025T4ZZ	04 05	163-165 270-272	Destruction of left pulmonary vein, percutaneous endoscopic approach

The requestor performed its own analysis and stated that it found the most common MS–DRG assignment for cases describing standalone percutaneous endoscopic surgical ablation was MS–DRGs 228 and 229 (Other Cardiothoracic Procedures with and without MCC, respectively) and that in those MS–DRGs, the standalone surgical ablation procedures cost more than all the procedures in their currently assigned MS–DRGs 228 and 229. Therefore, the requestor recommended CMS reassign these procedures to higher weighted MS–DRGs 219 and 220 (Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC and with CC, respectively).

We examined claims data from the March 2020 update of the FY 2019 MedPAR file for all cases in MS–DRGs 228 and 229 and compared the results to cases with a procedure code describing a standalone percutaneous endoscopic surgical ablation procedure. Our findings are shown in the following table.

MS-DRGs 228 – 229: Cases Reporting Procedures Describing Percutaneous Endoscopic Surgical Ablation				
MS-DRG	**ICD-10-PCS codes**	**Number of Cases**	**Average Length of Stay**	**Average Costs**
228	All cases	4,436	10.7	$45,772
	Cases with procedure code for percutaneous endoscopic surgical ablation	99	7.1	$48,281
229	All Cases	5,250	5.3	$29,454
	Cases with procedure code for percutaneous endoscopic surgical ablation	497	3.7	$35,516

As shown in the table, the data analysis performed indicates that the 99 cases in MS–DRG 228 reporting a procedure code that describes percutaneous endoscopic surgical ablation have an average length of stay that is shorter than the average length of stay for all the cases in MS–DRG 228 (7.1 days versus 10.7 days) and higher average costs when compared to all the cases in MS–DRG 228 ($48,281 versus $45,772). The 497 cases in MS–DRG 229 reporting a procedure code that describes percutaneous endoscopic surgical ablation have an average length of stay that is shorter than the average length of stay for all the cases in MS–DRG 229 (3.7 days versus 5.8 days) and higher average costs when compared to all the cases in MS–DRG 229 ($35,516 versus $29,454).

We then examined the claims data from the March 2020 update of the FY 2019 MedPAR file to identify the average length of stay and average costs for all cases in MS–DRGs 219 and 220. Our findings are shown in the table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
219	15,597	10.9	$57,845
220	15,074	6.5	$39,565

As shown in the table, for MS–DRG 219, there were a total of 15,597 cases with an average length of stay of 10.9 days and average costs of $57,845. For MS–DRG 220, there were a total of 15,074 cases with an average length of stay of 6.5 days and average costs of $39,565.

We also examined claims data from the September 2020 update of the FY 2020 MedPAR file for all cases in MS–DRGs 228 and 229 and compared the results to cases with a procedure code describing a standalone percutaneous endoscopic surgical ablation procedure. Our findings are shown in the following table.

MS-DRGs 228 – 229: Cases Reporting Procedures Describing Percutaneous Endoscopic Surgical Ablation

MS-DRG	ICD-10-PCS codes	Number of Cases	Average Length of Stay	Average Costs
228	All cases	4,419	10.2	$46,508
	Cases with procedure code for percutaneous endoscopic surgical ablation	84	6.9	$44,710
229	All Cases	4,732	4.9	$29,885
	Cases with procedure code for percutaneous endoscopic surgical ablation	393	3.4	$34,237

As shown in the table, the data analysis performed indicates that the 84 cases in MS–DRG 228 reporting a procedure code that describes percutaneous endoscopic surgical ablation have an average length of stay that is shorter than the average length of stay for all the cases in MS–DRG 228 (6.9 days versus 10.2 days) and lower average costs when compared to all the cases in MS–DRG 228 ($44,710 versus $46,508). The 393 cases in MS–DRG 229 reporting a procedure code that describes percutaneous endoscopic surgical ablation have an average length of stay that is shorter than the average length of stay for all the cases in MS–DRG 229 (3.4 days versus 4.9 days) and higher average costs when compared to all the cases in MS–DRG 229 ($34,237 versus $29,885).

We then examined the claims data from the September 2020 update of the FY 2020 MedPAR file to identify the average length of stay and average costs for all cases in MS–DRGs 219 and 220. Our findings are shown in the table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
219	11,863	10.9	$61,934
220	10,072	6.5	$41,800

As shown in the table, for MS–DRG 219, there were a total of 11,863 cases with an average length of stay of 10.9 days and average costs of $61,934. For MS–DRG 220, there were a total of 10,072 cases with an average length of stay of 6.5 days and average costs of $41,800.

Our analysis indicates that MS–DRGs 219 and 220 generally have much higher average costs and longer average lengths of stay than the cases with a procedure code describing a standalone percutaneous endoscopic surgical ablation procedure currently assigned to MS–DRGs 228 and 229. Instead, the average costs and average length of stay for cases reporting a standalone percutaneous endoscopic surgical ablation appear to be generally more aligned with the average costs and average length of stay for all cases in MS–DRGs 228 and 229, where they are currently assigned. Our clinical advisors reviewed this issue and do not recommend changing the assignment of procedure codes describing percutaneous endoscopic surgical ablation. Therefore, for these reasons, we are proposing to maintain the current structure of MS–DRGs 219 and 220.

f. Drug-Eluting Stents

We received a request to review the MS–DRG assignments of claims involving the insertion of coronary stents in percutaneous coronary interventions. The requestor suggested that CMS eliminate the distinction between drug-eluting and bare-metal coronary stents in the MS–DRG classification. According to the requestor, coated stents have a clinical performance comparable to drug-eluting stents however they are grouped with bare-metal stents because they do not contain a drug. The requestor asserted that this comingling muddies the

clinical coherence of the MS–DRG structure, as one cannot infer distinctions in clinical performance or benefits among the groups and potentially creates a barrier (based on hospital decision-making) to patient access to modern coated stents.

The requestor listed the following MS–DRGs in its request.

- MS–DRG 246 (Percutaneous Cardiovascular Procedures with Drug-Eluting Stent with MCC or 4+ Arteries or Stents);
- MS–DRG 247 (Percutaneous Cardiovascular Procedures with Drug-Eluting Stent without MCC);
- MS–DRG 248 (Percutaneous Cardiovascular Procedures with Non-Drug-Eluting Stent with MCC or 4+ Arteries or Stents); and
- MS–DRG 249 (Percutaneous Cardiovascular Procedures with Non-Drug-Eluting Stent without MCC).

According to the requestor, the non-drug-eluting stent MS–DRGs have outlived their usefulness in the stent market. The requestor performed its own analysis of MedPAR data from FY 2015 through FY 2019 and stated that it found the volume of cases describing non-drug-eluting coronary stents has declined since 2015, culminating in FY 2019, with drug-eluting stents accounting for 96.1% of all stent cases within the Medicare program, while non-drug-eluting stents accounted for only 3.9% that year. The requestor asserted that the assignment of coated stents to the non-drug-eluting stent category creates a market distortion as this newer technology is being comingled with very old technology at a payment disadvantage large enough to influence hospitals' willingness to prescribe, while at the same time acknowledging that the separation in average charges and costs between the non-drug-eluting stent category and the drug-eluting stent category is minimal in their analysis of the claims data.

Based on a review of the procedure codes that are currently assigned to MS–DRGs 246, 247, 248 and 249, our clinical advisors agree that further refinement of these MS–DRGs may be warranted. However, in ICD–10–PCS, a stent is considered an intraluminal device. The distinction between drug-eluting and non-drug eluting intraluminal devices is found elsewhere in the ICD–10–PCS procedure code classification and evaluating this request requires a more extensive analysis to assess potential impacts across the MS–DRGs. For these reasons, at this time, our clinical advisors recommend that rather than evaluating the procedure codes assigned to MS–DRGs 246, 247, 248 and 249 in isolation, additional analysis should be performed for this subset of procedure codes across the MS–DRGs, as part of the comprehensive procedure code review described in section II.D.11. of the preamble of this proposed rule. Therefore, we believe it would be more appropriate to consider this request further during our comprehensive procedure code review in future rulemaking.

6. MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue)

a. Knee Joint Procedures

We received a request to examine the procedure code combinations for procedures describing a right knee joint removal and replacement and procedures describing a left knee joint removal and replacement in MS–DRGs 466, 467, and 468 (Revision of Hip or Knee Replacement with MCC, with CC, and without CC/MCC, respectively). According to the requestor, when using the MS–DRG GROUPER software version 37, the left knee joint procedure combinations group correctly to MS–DRG 468, while the exact same right knee procedure code combinations group incorrectly to MS–DRG 465 (Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connective Tissue Disorders without CC/MCC).

The requestor provided the following procedure codes that describe the procedure code combinations for the left knee joint removal and replacement procedures currently assigned to MS–DRGs 466, 467, and 468.

ICD-10-PCS Code	Description	*with*	ICD-10-PCS Code	Description
0SPD4JC	Removal of synthetic substitute from left knee joint, patellar surface, percutaneous endoscopic approach	*with*	0SRW0JZ	Replacement of left knee joint, tibial surface with synthetic substitute, open approach
0SPU4JZ	Removal of synthetic substitute from left knee joint, femoral surface, percutaneous endoscopic approach	*with*	0SRW0JZ	Replacement of left knee joint, tibial surface with synthetic substitute, open approach
0SPW4JZ	Removal of synthetic substitute from left knee joint, tibial surface, percutaneous endoscopic approach	*with*	0SRW0JZ	Replacement of left knee joint, tibial surface with synthetic substitute, open approach

The requestor also provided the following procedure codes that describe the procedure code combinations for right knee joint removal and replacement procedures for CMS's review and consideration.

ICD-10-PCS Code	Description	*with*	ICD-10-PCS Code	Description
0SPC4JC	Removal of synthetic substitute from right knee joint, patellar surface, percutaneous endoscopic approach	*with*	0SRV0JZ	Replacement of right knee joint, tibial surface with synthetic substitute, open approach
0SPT4JZ	Removal of synthetic substitute from right knee joint, femoral surface, percutaneous endoscopic approach	*with*	0SRV0JZ	Replacement of right knee joint, tibial surface with synthetic substitute, open approach
0SPV4JZ	Removal of synthetic substitute from right knee joint, tibial surface, percutaneous endoscopic approach	*with*	0SRV0JZ	Replacement of right knee joint, tibial surface with synthetic substitute, open approach

We reviewed the procedure code combinations listed and agree with the requestor that the procedure codes that describe the procedure code combinations for right knee joint removal and replacement procedures were inadvertently excluded from the logic for MS–DRGs 466, 467, and 468.

During our review of the previously listed procedure code combinations describing removal and replacement of the right and left knee joints, we identified additional MS–DRGs in which the listed procedure code combinations for the left knee joint are in the logic, however, the listed procedure code combinations for the right knee joint were inadvertently excluded from the logic. Specifically, the listed procedure code combinations describing removal and replacement of the left knee joint are also included in the logic for case assignment to MS–DRGs 461 and 462 (Bilateral or Multiple Major Joint Procedures of Lower Extremity with and without MCC, respectively) in MDC 08 and in the logic for case assignment to MS–DRGs 628, 629, and 630 (Other Endocrine, Nutritional and Metabolic O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 10 (Endocrine, Nutritional and Metabolic Diseases and Disorders). Our clinical advisors stated that the procedure code combinations describing removal and replacement of the right knee joint should be added to MS–DRGs 461, 462, 466, 467, and 468 in MDC 08 and MS–DRGs 628, 629, and 630 in MDC 10 for consistency with the procedure code combinations describing removal and replacement of the left knee joint that are currently assigned to those MS–DRGs. Adding these procedure codes will improve clinical coherence and ensure more appropriate MS–DRG assignment for these cases.

Therefore, for FY 2022, we are proposing to add the three procedure code combinations listed previously describing removal and replacement of the right knee joint that were inadvertently omitted from the logic to MS–DRGs 461, 462, 466, 467, and 468 in MDC 08 and MS–DRGs 628, 629, and 630 in MDC 10.

b. Pelvic Trauma With Internal Fixation

We received a request to reassign cases reporting a diagnosis code describing a pelvic fracture in combination with a procedure code describing repair of a pelvic fracture with internal fixation, from the lower (NonCC) severity level MS–DRG of its current base MS–DRG assignment to the higher (MCC) severity level MS–DRG of its current base MS–DRG assignment. According to the requestor, there has been steady growth in the volume of internal fixation procedures performed for pelvic fractures since 2008. The requestor stated that due to this growth rate and the anticipated increase in utilization of these internal fixation devices in these procedures in the future that CMS should reconsider the payment structure for these cases it referred to as ''internal fixation for pelvic trauma''.

The requestor provided data for the Healthcare Common Procedural Coding System (HCPCS) code G0413 (Percutaneous skeletal fixation of posterior pelvic bone fracture and/or dislocation, for fracture patterns which disrupt the pelvic ring, unilateral or bilateral, (includes ileum, sacroiliac joint and/or sacrum) and current procedural terminology (CPT) code 22848 (Pelvic fixation (attachment of caudal end of instrumentation to pelvic bony structures) other than sacrum) from 2008 through 2018 that it crosswalked to ICD–10–PCS procedure codes. The requestor stated that this CPT coded data indicated that physicians have used pelvic fracture fixation, and pelvic instrumentation, for an increasing number of trauma/fracture repair cases, demonstrating expanded use of these devices in the pelvic area overall.

The requestor reported that sacral fractures are often underdiagnosed and once the diagnosis is made, bedrest is common, although prolonged bedrest is not recommended for the elderly. In addition, the requestor stated that pelvic fractures may be isolated or they may be associated with surrounding structures. For example, the requester reported that the sacroiliac joint is involved in approximately 30 to 35% of pelvic fracture cases. According to the requestor, the standard of care has also transitioned, from bedrest-only to surgery, and current medical practice has evolved to lower the threshold for fracture repair surgery. For instance, the requestor stated that smaller 5mm

fractures that were once left untreated now have standard treatment protocols involving the use of pelvic instrumentation. As a result, the requestor asserted that there will be greater utilization of internal fixation devices to treat these smaller pelvic fractures.

The requestor provided the following procedure codes that it stated describe procedures involving the use of internal fixation devices for pelvic fracture repair.

ICD-10-PCS Code	Description
0QS204Z	Reposition right pelvic bone with internal fixation device, open approach
0QS234Z	Reposition right pelvic bone with internal fixation device, percutaneous approach
0QS304Z	Reposition left pelvic bone with internal fixation device, open approach
0QS334Z	Reposition left pelvic bone with internal fixation device, percutaneous approach
0SG704Z	Fusion of right sacroiliac joint with internal fixation device, open approach
0SG734Z	Fusion of right sacroiliac joint with internal fixation device, percutaneous approach
0SG804Z	Fusion of left sacroiliac joint with internal fixation device, open approach
0SG834Z	Fusion of left sacroiliac joint with internal fixation device, percutaneous approach

The requestor also provided the following diagnosis code subcategories that it stated identify diagnoses describing pelvic fracture.

ICD-10-CM Subcategory	Description
S32.1 -	Fracture of sacrum
S32.2 -	Fracture of coccyx
S32.3 -	Fracture of ilium

The requestor performed its own analysis of claims data and reported findings for cases reporting a combination of the diagnosis codes found in the listed diagnosis code subcategories and the listed procedure codes (internal fixation for pelvic trauma) for MS–DRGs 515, 516, and 517 (Other Musculoskeletal System and Connective Tissue O.R. Procedures with MCC, with CC, and without CC/MCC, respectively); MS–DRGs 907, 908, and 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively); and MS–DRGs 957, 958, and 959 (Other O.R. Procedures for Multiple Significant Trauma with MCC, with CC, and without CC/MCC, respectively). According to the requestor, its findings support reassignment of these internal fixation for pelvic trauma cases from the lower severity level MS–DRG 517 to the higher severity level MS–DRG 515, from the lower severity level MS–DRG 909 to the higher severity level 907, and from the lower severity level MS–DRG 959 to the higher severity level 957. The requestor suggested that approximately 2,000 cases would be impacted by its recommendation to reassign internal fixation for pelvic trauma cases. The requestor also stated that these internal fixation for pelvic trauma cases currently result in a high rate of CMS outlier payments to institutions that perform a high volume of these procedures. Finally, the requestor stated that there is precedent for reassignment of cases from the lower severity level MS–DRGs to the higher severity level MS–DRG for cases involving the use of a device in orthopedic surgery. The requestor provided the examples of total ankle replacement procedures, spinal disc replacement procedures and neurostimulator implantation procedures to demonstrate how CMS has previously reassigned cases from the lower severity level MS–DRG to the higher severity level MS–DRG.

We first examined the claims data from the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file for all cases in MS–DRGs 515, 516, and 517; MS–DRGs 907, 908, and 909; and MS–DRGs 957, 958, and 959. Our findings are shown in the following tables.

March 2020 Update of the FY 2019 MedPAR File			
MS-DRG	**Number of cases**	**Average Length of Stay**	**Average Costs**
515 – All cases	4,831	8.2	$22,403
516 – All cases	14,089	4.6	$14,310
517 – All cases	12,675	2.6	$10,316
907 – All cases	10,342	9.6	$28,037
908 – All cases	9,129	5.2	$14,681
909 – All cases	2,994	2.9	$10,078
957 – All cases	2,325	13.1	$54,500
958 – All cases	1,845	8.2	$30,973
959 – All cases	130	5.1	$20,204

September 2020 Update of the FY 2020 MedPAR File			
MS-DRG	**Number of cases**	**Average Length of Stay**	**Average Costs**
515 – All cases	3,691	8.0	$23,094
516 – All cases	10,582	4.6	$15,308
517 – All cases	8,203	2.6	$11,301
907 – All cases	8,706	9.2	$28,127
908 – All cases	7,434	5.1	$15,222
909 – All cases	2,080	2.8	$10,650
957 – All cases	2,028	12.9	$56,366
958 – All cases	1,500	7.9	$32,638
959 – All cases	126	4.7	$18,423

We then examined claims data from the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file for cases reporting any combination of the diagnosis and procedure codes that the requestor provided to identify internal fixation for pelvic trauma cases in MS–DRGs 515, 516, and 517; MS–DRGs 907, 908, and 909; and MS–DRGs 957, 958, and 959.

We note that our analysis identified two types of cases in which the combination of a diagnosis code and a procedure code (that the requestor provided to identify internal fixation for pelvic trauma cases) was reported. The first type of case consisted of a diagnosis code describing a pelvic fracture reported in combination with a single procedure code describing repair of a pelvic fracture with internal fixation on a claim, and the second type of case consisted of a diagnosis code describing a pelvic fracture reported in combination with two procedure codes describing repair of a pelvic fracture with internal fixation (for example, one for the right side and one for the left side) on a claim. These cases are described as single and bilateral internal fixation procedures for pelvic trauma, respectively. We refer the reader to Tables 6P.1h and 6P.1i associated with this proposed rule (which are available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*) for the list of diagnosis and procedure code combinations reflecting single internal fixation for pelvic trauma procedures reported by case ID in each MS–DRG, by fiscal year, along with the detailed claims analysis. We refer the reader to Tables 6P.1j and 6P.1k associated with this proposed rule (which are available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*) for the list of diagnosis and procedure code combinations reflecting bilateral internal fixation for pelvic trauma procedures reported by case ID in each MS–DRG, by fiscal year, along with the detailed claims analysis. For example, Table 6P.1h shows the claims data analysis findings from the March 2020 update of the FY 2019 MedPAR file. Line 2 identifies the section for single cases reported in MS–DRG 515, line 13 identifies the section for single cases reported in MS–DRG 516, and line 42 identifies the single cases reported in MS–DRG 517. The following table summarizes the information found in each column of the tables.

Column	Description
A	Case ID (identification) assigned
B	MS-DRG
C	ICD-10-CM code reported as the principal diagnosis
D	Description of the ICD-10-CM diagnosis code
E	ICD-10-PCS code reported for procedure
F	Description of the ICD-10-PCS procedure code
G	Case count
H	Average length of stay for case in days
I	Average costs for case
J	Frequency of procedure reported for case
K	Length of stay for case in days
L	Cost of case

As shown in Table 6P.1h, line 4, column A, displays the Case ID ''Single-A'' for the first case; column B displays MS–DRG 515; column C displays the diagnosis code S32.111A; column D displays the description of the diagnosis code (Minimally displaced Zone 1 fracture of sacrum, initial encounter for closed fracture); column E displays the procedure code 0QS234Z; column F displays the description of the procedure code (Reposition right pelvic bone with internal fixation device, percutaneous approach); column G displays the case count 1; column H displays an average length of stay of 3.0 days; column I displays average costs of $8,433 for the case; column J displays the frequency of the procedure reported was one (1) occurrence; column K displays a 3.0 day length of stay for the case; and column L displays $8,433 for the cost of the case.

In our analysis of the claims data from the March 2020 update of the FY 2019 MedPAR file, we found that there were no cases reporting any combination of the diagnosis codes and procedure codes previously listed in MS–DRGs 907, 908, and 909 or MS–DRGs 957, 958, and 959. Our findings are shown in the following table for any cases found to report a diagnosis code describing a pelvic trauma in combination with a procedure code describing single internal fixation in MS–DRGs 515, 516, and 517.

March 2020 Update of the FY 2019 MedPAR File			
MS-DRG	**Number of cases**	**Average Length of Stay**	**Average Costs**
515 – All cases	4,831	8.2	$22,403
515 – Cases with single internal fixation for pelvic trauma	6	5.67	$28,368
516 – All cases	14,089	4.6	$14,310
516 – Cases with single internal fixation for pelvic trauma	20	5.8	$12,879
517 – All cases	12,675	2.6	$10,316
517 – Cases with single internal fixation for pelvic trauma	3	5.33	$12,147

As shown in the table, there were only three cases found in MS–DRG 517 reporting single internal fixation for pelvic trauma procedures, with an average length of stay of 5.33 days and average costs of $12,147. The average length of stay is longer and the average costs of these three cases higher compared to the average length of stay and the average costs for all cases in MS–DRG 517 (5.33 days versus 2.6 days and $12,147 versus $10,316, respectively); however, overall, we believe the data findings are comparable. Our clinical advisors did not support reassignment of the three cases from MS–DRG 517 to MS–DRG 515 based on the claims data analysis and also stated it would not be appropriate to reassign these cases into the higher severity level MS–DRG in the absence of a MCC and noted that the cases would not be clinically coherent with regard to resource utilization.

In our analysis of the claims data from the March 2020 update of the FY 2019 MedPAR file for cases in which a bilateral internal fixation for pelvic trauma procedure was performed, we identified one case in MS–DRG 517. As shown in Table 6P.1j, the average length of stay for this case was 4.0 days and the average costs were $24,258, which is longer than the average length of stay and greater than the average costs for all cases in MS–DRG 517 (2.6 days and $10,316, respectively). We also identified cases reporting various code combinations for MS–DRGs 515 and 516, and provide the details in Table 6P.1j associated with this proposed rule (which is available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*).

In our analysis of the claims data from the September 2020 update of the FY 2020 MedPAR file we found that there were no cases reporting any combination of the diagnosis codes and procedure codes previously listed in MS–DRG 909 or in MS–DRGs 957, 958, and 959. Our findings are shown in the following table for any cases found to report a diagnosis code describing a pelvic trauma in combination with a procedure code describing single internal fixation in MS–DRGs 515, 516, 517, 907, and 908.

September 2020 Update of the FY 2020 MedPAR File			
MS-DRG	**Number of cases**	**Average Length of Stay**	**Average Costs**
515- All cases	3,691	8.0	$23,094
515 - Cases with single internal fixation for pelvic trauma	6	8.3	$17,356
516 - All cases	10,582	4.6	$15,308
516 - Cases with single internal fixation for pelvic trauma	20	4.35	$14,163
517- All cases	8,203	2.6	$11,301
517 - Cases with single internal fixation for pelvic trauma	4	2.5	$10,136
907 - All cases	8,706	9.2	$28,127
907 - Cases with single internal fixation for pelvic trauma	1	25.0	$97,152
908 - All cases	7,434	5.1	$15,222
908 - Cases with single internal fixation for pelvic trauma	1	6.0	$19,741

As shown in the table, there were only four cases found in MS–DRG 517 reporting single internal fixation for pelvic trauma procedures, with an average length of stay of 2.5 days and average costs of $10,136. For the same reasons described previously based on the FY 2019 analysis, our clinical advisors did not support reassignment of the cases in the lower severity level MS–DRG 517 to the higher severity level MS–DRG 515. In addition, the average length of stay and average costs for these four cases reporting single internal fixation for pelvic trauma procedures are less than the average length of stay and average costs for all the cases in MS–DRG 517 (2.5 days versus 2.6 days and $10,136 versus $11,301, respectively)); however, overall, we believe the data findings are comparable.

In our analysis of the claims data from the September 2020 update of the FY 2020 MedPAR file for cases in which a bilateral internal fixation for pelvic trauma procedure was performed, we identified one case in MS–DRG 517. As shown in Table 6P.1k, the average length of stay for this case was 2.0 days and the average costs were $10,103, which is shorter than the average length of stay and less than the average costs for all cases in MS–DRG 517 (2.6 days and $11,301, respectively). We also identified cases reporting various combinations for MS–DRGs 515, 516 and MS–DRG 907, and provide the details in Table 6P.1k associated with this proposed rule (which is available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*).

We believe further analyses of these internal fixation for pelvic trauma cases in the claims data is warranted. We note that our analysis for both the single and bilateral cases was centered on the reporting of a principal diagnosis code describing a pelvic trauma (fracture) in combination with a procedure code describing internal fixation based on the codes provided by the requestor. However, we also identified cases in the claims data in which a pelvic trauma diagnosis code was reported as a secondary diagnosis code in combination with a procedure code describing internal fixation and believe these cases require further evaluation. In addition, during our review of the diagnosis and procedure codes that the requestor provided, we identified diagnosis codes that we believe do not warrant consideration for purposes of this request and additional procedure codes that describe internal fixation for pelvic trauma procedures, which we believe do warrant further analysis. For example, as previously noted, the requestor provided the subcategories for

the diagnosis codes that it requested we consider for analysis. We do not agree that diagnosis codes describing a pelvic fracture that include the term ''sequela'' should be considered in the analysis to examine this request because, in the ICD–10–CM classification, the term sequela is defined as the residual effect (condition produced) after the acute phase of an illness or injury has terminated.

We refer the reader to Table 6P.1g for the list of diagnosis codes that are included in the diagnosis subcategories provided by the requestor and the list of procedure codes provided by the requestor, which also contains the procedure codes we identified. Additional time is needed for data analysis given the volume of these code combinations and corresponding data. We also believe that additional time is needed to allow for further analysis of the claims data to determine the causes of the fractures and other possible contributing factors with respect to the length of stay and costs of these cases, as well as the rate of outlier payments as identified by the requestor. Our clinical advisors also believe that future data findings may demonstrate additional variance in resource utilization for this patient population. We further note that, as discussed in the FY 2021 IPPS/LTCH PPS final rule, we finalized the addition of 161 procedure codes to MS–DRGs 957, 958, and 959 in MDC 24 (Multiple Significant Trauma) that include the insertion of internal fixation devices. We believe it would be beneficial to examine future claims data to determine if there is a change in the volume of cases in those specific MS–DRGs as a result of that update. For these reasons, we are proposing to maintain the structure of MS–DRGs 515, 516, and 517; MS–DRGs 907, 908, and 909; and MS–DRGs 957, 958, and 959 for FY 2022.

7. MDC 11 (Diseases and Disorders of the Kidney and Urinary Tract): Chronic Renal Replacement Therapy (CRRT)

We received a request to create new MS–DRGs for cases where the patient receives continuous renal replacement therapy (CRRT) during the inpatient stay. According to the requestor, hospitals incur higher costs related to CRRT and current MS–DRG definitions do not adequately account for the clinical and resource requirements of CRRT. The requestor stated Medicare reimbursement is insufficient to cover the costs of administering CRRT, creating a disincentive in offering this dialysis modality and is a barrier to further adoption of CRRT. The requestor suggested that the following two new MS–DRGs be created:

- Suggested New MS–DRG XXX—Continuous Renal Replacement Therapy with CC/MCC; and
- Suggested New MS–DRG XXX—Continuous Renal Replacement Therapy without CC/MCC.

Renal replacement therapy (RRT) replaces kidney function by exchanging solute and removing fluid from the blood as a means to prevent or treat renal failure in patients with acute kidney injury (AKI). Modalities of renal support include CRRT, conventional intermittent hemodialysis (IHD), and prolonged intermittent renal replacement therapies (PIRRTs), which are a hybrid of CRRT and IHD. IHD provides solute clearance and filtration during relatively brief treatment sessions, generally lasting from three to five hours. CRRT provides gradual fluid removal and solute clearance over prolonged treatment times, typically over a 24-hour period, mimicking the natural function of the kidney to allow for the continuous removal or replacement of fluid. The most common CRRT modalities are continuous venovenous hemofiltration, continuous venovenous hemodialysis, and continuous venovenous hemodiafiltration.

According to the requestor, CRRT is used primarily to treat critically ill, hospitalized patients who experience AKI requiring more intensive and continuous treatment than other dialysis modalities. The requestor stated that CRRT offers fluid balance and convective clearance that may be precisely adjusted for each patient, and has been associated with a higher likelihood of kidney recovery as compared to other modalities of RRT. The requestor asserted that IHD may worsen the neurological status of patients with acute brain injury or other causes of increased intracranial pressure by compromising their cerebral perfusion by raising intracranial pressure. The ongoing modulation of fluid balance and targeted fluid management capabilities of CRRT enables its use in situations other than renal failure. According to the requestor, CRRT, a slow continuous therapy, is preferred for patients who are hemodynamically unstable because it helps prevent the hemodynamic fluctuations common with the more rapid IHD. In light of the COVID–19 pandemic, the requestor noted the National Institutes of Health's Coronavirus Disease 2019 (COVID–19) Treatment Guidelines and The American Society of Nephrology recommend CRRT as the preferred renal replacement therapy for critically ill, COVID–19 patients experiencing AKI, who develop indications for renal replacement therapy, due to the hemodynamic instability often experienced in this condition.

The requestor acknowledged that under the current MS–DRG definitions, Medicare cases with beneficiaries receiving CRRT are assigned to more than 300 MS–DRGs. Although these beneficiaries are clinically similar in that they are critically ill patients who experience AKI requiring more intensive and continuous treatment than other dialysis modalities, the principal diagnoses for their inpatient stays vary. The requestor stated their analysis of the variability in principal diagnosis of the cases examined with beneficiaries receiving CRRT indicated that, in general, IHD tends to be used more for patients with chronic illnesses, and CRRT tends to be used for more acute injuries and end of life scenarios. Therefore, the requestor suggested that CMS create new MS–DRGs specific to CRRT, without regard to principal diagnosis, in order to group the resource intensive, clinically coherent, CRRT cases together in contrast to the existing GROUPER definitions.

According to the requestor, continuing to assign CRRT to existing MS–DRGs would be clinically inappropriate and remain financially devastating to providers even when treating the most routine, uncomplicated CRRT patients. The requestor performed its own data analysis and stated hospitals lose over $22,000 per CRRT case on average, even when outliers are considered, which they state is a shortfall of more than 30 percent. The requestor asserted these losses create a disincentive for providers to offer CRRT despite its clinical benefits. The requestor also asserted the magnitude of financial losses associated with the provision of CRRT at the current level of MS–DRG payment could force many hospitals to examine the capacity and scope of their CRRT programs if facilities continue to determine that the financial burden of treating Medicare beneficiaries with CRRT is more than the facility can sustain. As COVID–19 continues to strain hospital resources, the requestor asserts the availability of CRRT should not be impeded by inadequate MS–DRG payments related to CRRT.

The following ICD–10–PCS procedure code identifies the performance of CRRT.

ICD-10-PCS Code	Code Description
5A1D90Z	Performance of urinary filtration, continuous, greater than 18 hours per day

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure code 5A1D90Z is currently recognized as a non-O.R. procedure that affects the MS–DRG to which it is assigned. Our clinical advisors agree that the principal diagnosis assigned for inpatient admissions where continuous renal replacement of therapy is utilized can vary. To examine the impact of the use of CRRT, we examined claims data from the March 2020 update of the FY 2019 MedPAR file for the top ten MS–DRGs reporting the use of CRRT. Our findings are reflected in the following table:

Top 10 MS-DRGs Reporting Continuous Renal Replacement Therapy					
MS-DRG	Description		Number of Cases	Average Length of Stay	Average Costs
871	Septicemia or Severe Sepsis without MV >96 Hours with MCC	All cases	609,320	6.2	$13,338
		Cases with CRRT	2,912	7.9	$27,681
870	Septicemia Or Severe Sepsis with MV >96 Hours	All cases	32,497	14.5	$44,878
		Cases with CRRT	1,731	15.9	$60,478
853	Infectious and Parasitic Diseases with O.R. Procedures with MCC	All cases	85,196	12.5	$34,178
		Cases with CRRT	1,470	17.4	$69,966
003	ECMO or Tracheostomy with MV >96 hours or Principal Diagnosis Except Face, Mouth and Neck with Major O.R. Procedures	All cases	14,532	30.2	$128,196
		Cases with CRRT	1,459	33.4	$174,085
291	Heart Failure and Shock with MCC	All cases	394,415	5.1	$9,668
		Cases with CRRT	660	11.9	$34,628
004	Tracheostomy with MV >96 hours or Principal Diagnosis Except Face, Mouth and Neck without Major O.R. Procedures	All cases	12,702	24.5	$77,393
		Cases with CRRT	463	35.5	$138,940
207		All cases	18,412	14	$39,929

Top 10 MS-DRGs Reporting Continuous Renal Replacement Therapy					
MS-DRG	**Description**		**Number of Cases**	**Average Length of Stay**	**Average Costs**
	Respiratory System Diagnosis with Ventilator Support >96 Hours	Cases with CRRT	458	16.8	$61,632
219	Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC	All cases	15,597	10.9	$57,845
		Cases with CRRT	442	17.1	$98,802
270	Other Major Cardiovascular Procedures with MCC	All cases	18,959	9.5	$37,249
		Cases with CRRT	430	14.8	$70,030
682	Renal Failure with MCC	All cases	103,511	5.7	$10,486
		Cases with CRRT	401	9.8	$29,089

As shown in this table, our data findings demonstrate the average lengths of stay were longer and the average costs were higher for the cases reporting the use of CRRT when compared to all cases in their respective MS–DRG. We note that the claims data demonstrate that the MS–DRG with the largest number of cases reporting CRRT is MS–DRG 871 with 2,912 cases. Of the top 10 MS–DRGs reporting CRRT, the MS–DRG with the smallest number of cases is MS–DRG 682 with 401 cases. The average length of stay of this subset of cases ranges from a high of 35.5 days in MS–DRG 004 to a low of 7.9 days in MS–DRG 871 for cases reporting the use of CRRT. The average costs of this subset of cases ranges from a high of $174,085 in MS–DRG 003 to a low of $27,681 in MS–DRG 871 for cases reporting the use of CRRT.

We also examined claims data from the September 2020 update of the FY 2020 MedPAR file for the top ten MS–DRGs reporting the use of CRRT. Our similar findings are reflected in the following table:

Top 10 MS-DRGs Reporting Continuous Renal Replacement Therapy					
MS-DRG	Description		Number of Cases	Average Length of Stay	Average Costs
871	Septicemia or Severe Sepsis without MV >96 Hours with MCC	All cases	552,641	6.4	$14,140
		Cases with CRRT	3,023	7.9	$29,248
870	Septicemia Or Severe Sepsis with MV >96 Hours	All cases	40,079	15.2	$48,909
		Cases with CRRT	2,480	16.7	$66,120
853	Infectious and Parasitic Diseases with O.R. Procedures with MCC	All cases	78,586	12.3	$35,594
		Cases with CRRT	1,464	17.1	$71,270
003	ECMO or Tracheostomy with MV >96 hours or Principal Diagnosis Except Face, Mouth and Neck with Major O.R. Procedures	All cases	11,768	30.9	$137,021
		Cases with CRRT	1,338	34	$182,952
207	Respiratory System Diagnosis with Ventilator Support >96 Hours	All cases	24,106	15.8	$47,379
		Cases with CRRT	976	18.7	$68,254
004	Tracheostomy with MV >96 hours or Principal Diagnosis Except Face, Mouth and Neck without Major O.R. Procedures	All cases	12,248	26.4	$88,922
		Cases with CRRT	600	34.9	$134,323
291	Heart Failure and Shock with MCC	All cases	313,097	5.1	$10,055
		Cases with CRRT	594	10.7	$33,604
208	Respiratory System Diagnosis with Ventilator Support <=96 Hours	All cases	50,397	6.9	$19,519
		Cases with CRRT	496	8.6	$31,853
270	Other Major Cardiovascular Procedures with MCC	All cases	16,764	9.3	$39,520
		Cases with CRRT	416	14.3	$68,957
219	Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC	All cases	11,863	10.9	$61,934
		Cases with CRRT	374	18.7	$108,744

As shown in this table, our data findings show that the average lengths of stay were longer and the average costs were higher for the cases reporting the use of CRRT when compared to all cases in their respective MS–DRG. We note that the claims data demonstrate that the MS–DRG with the largest number of cases reporting CRRT is MS–DRG 871 with 3,023 cases. Of the top 10 MS–DRGs reporting CRRT, the MS–DRG with the smallest number of cases is MS–DRG 219 with 374 cases. The average length of stay of this subset of cases ranges from a high of 34.9 days in MS–DRG 004 to a low of 7.9 days in MS–DRG 871 for cases reporting the use of CRRT. The average costs of this subset of cases ranges from a high of $182,952 in MS–DRG 003 to a low of $29,248 in MS–DRG 871 for cases reporting the use of CRRT.

While the results of the claims analysis indicate that the average costs and average lengths of stay for cases reporting the use of CRRT are higher compared to the average costs for all cases in their assigned MS–DRG, we are unable to ascertain from the claims data the resource use specifically attributable to CRRT during a hospital stay. There is large variability in the differences in average costs from MS–DRG to MS–DRG, indicating there may have been other factors contributing to the higher costs. When reviewing consumption of hospital resources for this subset of cases, the claims data clearly demonstrate the patients typically have a major complication or co-morbid (MCC) condition reported based on the MS–DRGs assigned. The claims data also reflects, based on the top ten MS–DRGS, that the procedure frequently occurs in cases with other procedures with higher than average resource use such as mechanical ventilation, tracheostomy, extracorporeal membrane oxygenation (ECMO) and other major cardiovascular procedures that also may be contributing to the higher average costs for these cases.

To further examine the variability in cases reporting the use of CRRT, we also reviewed the claims data to identify the number (frequency) and types of principal diagnoses that were reported to determine what factors may also be contributing to the higher average costs for these cases.

Our findings for the top 10 principal diagnoses that were reported within the claims data from the March 2020 update of the FY 2019 MedPAR file for this subset of cases is shown in the following table:

Top 10 Principal Diagnoses Reported with the Procedure Code for Continuous Renal Replacement Therapy				
ICD-10-CM Code	**Description**	**Number of Times Reported**	**Average Length of Stay**	**Average Costs**
A41.9	Sepsis, unspecified organism	4,226	12.6	$48,150
I21.4	Non-ST elevation (NSTEMI) myocardial infarction	691	16.5	$85,557
I13.0	Hypertensive heart and chronic kidney disease with heart failure and stage 1 through stage 4 chronic kidney disease, or unspecified chronic kidney disease	652	20	$81,401
I13.2	Hypertensive heart and chronic kidney disease with heart failure and with stage 5 chronic kidney disease, or end stage renal disease	551	17.6	$60,493
A41.51	Sepsis due to Escherichia coli [E. coli]	459	14.7	$54,643
J96.01	Acute respiratory failure with hypoxia	346	13.2	$50,227
N17.9	Acute kidney failure, unspecified	319	13.8	$40,908
N17.0	Acute kidney failure with tubular necrosis	307	14.3	$41,196
A41.59	Other Gram-negative sepsis	273	17.4	$67,917
A41.01	Sepsis due to Methicillin susceptible Staphylococcus aureus	271	17.1	$62,664

The claims data in this table reflects a wide variance with regard to the frequency and types of principal diagnoses that were reported along with the procedure code describing the use of CRRT. We note that the claims data demonstrate that the diagnosis with the largest number of cases reporting CRRT is A41.9 (Sepsis, unspecified organism) with 4,226 cases. Of the top 10 principal diagnoses reporting CRRT, the diagnosis with the smallest number of cases is A41.01 (Sepsis due to Methicillin susceptible Staphylococcus aureus) with 271 cases. The average length of stay of this subset of cases ranges from a high of 20 days with a diagnosis of I13.0 (Hypertensive heart and chronic kidney disease with heart failure and stage 1 through stage 4 chronic kidney disease, or unspecified chronic kidney disease) to a low of 12.6 days with a diagnosis of A41.9 (Sepsis, unspecified organism) for cases reporting the use of CRRT. The average costs of this subset of cases ranges from a high of $85,557 with a diagnosis of I21.4 (Non-ST elevation (NSTEMI) myocardial infarction) to a low of $40,908 with a diagnosis of N17.9 (Acute kidney failure, unspecified) for cases reporting the use of CRRT.

Our findings for the top 10 principal diagnoses that were reported within the claims data from the September 2020 update of the FY 2020 MedPAR file for this subset of cases is shown in the following table:

Top 10 Principal Diagnoses Reported with the Procedure Code for Continuous Renal Replacement Therapy				
ICD-10-CM Code	**Description**	**Number of Times Reported**	**Average Length of Stay**	**Average Costs**
A41.9	Sepsis, unspecified organism	4,128	12.5	$51,228
A41.89	Other specified sepsis	1,302	18.8	$76,519
U07.1	COVID-19	868	21.4	$79,721
I21.4	Non-ST elevation (NSTEMI) myocardial infarction	650	16.6	$86,717
I13.0	Hypertensive heart and chronic kidney disease with heart failure and stage 1 through stage 4 chronic kidney disease, or unspecified chronic kidney disease	618	19	$77,404
I13.2	Hypertensive heart and chronic kidney disease with heart failure and with stage 5 chronic kidney disease, or end stage renal disease	532	16.3	$59,959
A41.51	Sepsis due to Escherichia coli [E. coli]	437	15.6	$58,858
J96.01	Acute respiratory failure with hypoxia	340	11.8	$48,882
A41.59	Other Gram-negative sepsis	295	16.5	$65,951
N17.0	Acute kidney failure with tubular necrosis	270	16.2	$49,577

The claims data in this table also reflects a wide variance with regard to the frequency and types of principal diagnoses that were reported along with the procedure code describing the use of CRRT. As shown, the claims data demonstrate that the diagnosis with the largest number of cases reporting CRRT is A41.9 (Sepsis, unspecified organism) with 4,128 cases. Of the top 10 principal diagnoses reporting CRRT, the diagnosis with the smallest number of cases is N17.0 (Acute kidney failure with tubular necrosis) with 270 cases. The average length of stay of this subset of cases ranges from a high of 21.4 days with a diagnosis of U07.1 (COVID–19) to a low of 11.8 days with a diagnosis of J96.01 (Acute respiratory failure with hypoxia) for cases reporting the use of CRRT. The average costs of this subset of cases ranges from a high of $ 86,717 with a diagnosis of I21.4 (Non-ST elevation (NSTEMI) myocardial infarction) to a low of $ 48,882 with a diagnosis of J96.01 (Acute respiratory failure with hypoxia) for cases reporting the use of CRRT.

To evaluate the frequency with which the use of CRRT is reported for different clinical scenarios, we examined claims from the March 2020 update of the FY 2019 MedPAR file across each of the 25 MDCs to determine the number of cases reporting the use of CRRT. Our findings are shown in this table.

BILLING CODE 4120–01–P

Continuous Renal Replacement Therapy Across All MDCs			
MDC	**Number of Cases**	**Average Length of Stay**	**Average Costs**
All cases with CRRT	19,608	16.5	$68,592
MDC 01 (Diseases and Disorders of the Nervous System)--Cases with CRRT	558	17.5	$64,523
MDC 02 (Disease and Disorders of the Eye)--Cases with CRRT	5	15.4	$36,053
MDC 03 (Diseases and Disorders of the Ear, Nose, Mouth and Throat)--Cases with CRRT	23	17.4	$65,221
MDC 04 (Diseases and Disorders of the Respiratory System)--Cases with CRRT	1,370	17.8	$72,158
MDC 05 (Diseases and Disorders of the Circulatory System)--Cases with CRRT	6,027	17.9	$86,024
MDC 06 (Diseases and Disorders of the Digestive System)--Cases with CRRT	987	18.8	$73,408
MDC 07 (Diseases and Disorders of the Hepatobiliary System and Pancreas)--Cases with CRRT	870	20.9	$87,272
MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue)--Cases with CRRT	412	18.2	$69,621
MDC 09 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast)--Cases with CRRT	72	14.5	$43,633
MDC 10 (Endocrine, Nutritional and Metabolic Diseases and Disorders)--Cases with CRRT	383	11.8	$41,559
MDC 11 (Diseases and Disorders of the Kidney and Urinary Tract)--Cases with CRRT	1,134	15.4	$48,276
MDC 12 (Diseases and Disorders of the Male Reproductive System)--Cases with CRRT	9	17.3	$55,931

Continuous Renal Replacement Therapy Across All MDCs			
MDC	**Number of Cases**	**Average Length of Stay**	**Average Costs**
MDC 13 (Diseases and Disorders of the Female Reproductive System)--Cases with CRRT	15	47.3	$131,252
MDC 14 (Pregnancy, Childbirth and the Puerperium)--Cases with CRRT	3	8	$22,852
MDC 16 (Diseases and Disorders of Blood, Blood Forming Organs, Immunologic Disorders)--Cases with CRRT	134	21.8	$78,138
MDC 17 (Myeloproliferative Diseases and Disorders, Poorly Differentiated Neoplasms)--Cases with CRRT	260	25.8	$95,309
MDC 18 (Infectious and Parasitic Diseases, Systemic or Unspecified Sites)--Cases with CRRT	6,761	14.1	$54,051
MDC 19 (Mental Diseases and Disorders)--Cases with CRRT	5	13.8	$30,664
MDC 20 (Alcohol/Drug Use and Alcohol/Drug Induced Organic Mental Disorders)--Cases with CRRT	5	15.4	$39,332
MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs)--Cases with CRRT	390	16.3	$61,846
MDC 22 (Burns)--Cases with CRRT	27	19	$104,749
MDC 23 (Factors Influencing Health Status and Other Contacts with Health Services)--Cases with CRRT	13	15.6	$36,295
MDC 24 (Multiple Significant Trauma)--Cases with CRRT	86	10.2	$59,113
MDC 25 (Human Immunodeficiency Virus Infections)--Cases with CRRT	59	15.6	$50,581

As shown in the table, the top five MDCs with the largest number of cases reporting CRRT are MDC 18, with 6,761 cases; MDC 05, with 6,027 cases; MDC 04, with 1,370 cases; MDC 11, with 1,134 cases; and MDC 06, with 987 cases. The top five MDCs with the highest average costs for cases reporting the use of CRRT were MDC 13, with average costs of $131,252; MDC 22, with average costs of $104,749; MDC 17, with average costs of $95,309; MDC 07, with average costs of $87,272; and MDC 05, with average costs of $86,024. The claims data indicate that the average length of stay ranges from a high of 47.3 days in MDC 13 to a low of 8 days in MDC 14 for cases reporting the use of CRRT across each of the 25 MDCs.

We also examined claims from the September 2020 update of the FY 2020 MedPAR file across each of the 25 MDCs to determine the number of cases

reporting the use of CRRT. Our findings are shown in this table.

Continuous Renal Replacement Therapy Across All MDCs			
MDC	**Number of Cases**	**Average Length of Stay**	**Average Costs**
All cases with CRRT	20,385	16.5	$70,398
MDC 01 (Diseases and Disorders of the Nervous System)--Cases with CRRT	549	17.6	$67,407
MDC 02 (Disease and Disorders of the Eye)--Cases with CRRT	3	15.7	$50,915
MDC 03 (Diseases and Disorders of the Ear, Nose, Mouth and Throat)--Cases with CRRT	15	19.1	$68,270
MDC 04 (Diseases and Disorders of the Respiratory System)--Cases with CRRT	2,191	18.4	$71,644
MDC 05 (Diseases and Disorders of the Circulatory System)--Cases with CRRT	5,516	17.4	$87,875
MDC 06 (Diseases and Disorders of the Digestive System)--Cases with CRRT	838	17.2	$71,559
MDC 07 (Diseases and Disorders of the Hepatobiliary System and Pancreas)--Cases with CRRT	803	21.1	$86,894
MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue)--Cases with CRRT	357	18.7	$77,515
MDC 09 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast)--Cases with CRRT	73	13.8	$50,455

Continuous Renal Replacement Therapy Across All MDCs			
MDC	**Number of Cases**	**Average Length of Stay**	**Average Costs**
MDC 10 (Endocrine, Nutritional and Metabolic Diseases and Disorders)--Cases with CRRT	361	12.5	$39,170
MDC 11 (Diseases and Disorders of the Kidney and Urinary Tract)--Cases with CRRT	1,066	15.9	$54,348
MDC 12 (Diseases and Disorders of the Male Reproductive System)--Cases with CRRT	12	16.8	$59,223
MDC 13 (Diseases and Disorders of the Female Reproductive System)--Cases with CRRT	18	12.8	$45,623
MDC 14 (Pregnancy, Childbirth and the Puerperium)--Cases with CRRT	1	14	$37,193
MDC 16 (Diseases and Disorders of Blood, Blood Forming Organs, Immunologic Disorders)--Cases with CRRT	107	16.4	$63,682
MDC 17 (Myeloproliferative Diseases and Disorders, Poorly Differentiated Neoplasms)--Cases with CRRT	209	21.9	$88,182
MDC 18 (Infectious and Parasitic Diseases, Systemic or Unspecified Sites)--Cases with CRRT	7,678	14.7	$59,317
MDC 19 (Mental Diseases and Disorders)--Cases with CRRT	5	18.4	$36,453
MDC 20 (Alcohol/Drug Use and Alcohol/Drug Induced Organic Mental Disorders)--Cases with CRRT	5	11	$37,345
MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs)--Cases with CRRT	393	14.7	$61,513
MDC 22 (Burns)--Cases with CRRT	41	26.7	$139,224
MDC 23 (Factors Influencing Health Status and Other Contacts with Health Services)--Cases with CRRT	8	14.1	$40,364
MDC 24 (Multiple Significant Trauma)--Cases with CRRT	78	14.6	$68,916
MDC 25 (Human Immunodeficiency Virus Infections)--Cases with CRRT	58	16.3	$65,767

BILLING CODE 4120–01–C

As shown in the table, the top five MDCs with the largest number of cases reporting CRRT are MDC 18, with 7,678 cases; MDC 05, with 5,516 cases; MDC

04, with 2,191 cases; MDC 11, with 1,066 cases; and MDC 06, with 838 cases. The top five MDCs with the highest average costs for cases reporting the use of CRRT were MDC 22, with average costs of $139,244; MDC 17, with average costs of $88,182; MDC 05, with average costs of $87,875; MDC 07, with average costs of $86,894; and MDC 08, with average costs of $ 77,515. The claims data indicate that the average length of stay ranges from a high of 26.7 days in MDC 22 to a low of 11 days in MDC 20 for cases reporting the use of CRRT across each of the 25 MDCs.

Our clinical advisors reviewed the clinical issues and the claims data, and did not support creating new MS–DRGs for CRRT without regard to principal diagnosis. Our clinical advisors noted that more than one modality for RRT can be utilized for managing patients with AKI given the needs of the patient. For example, a patient may initially start on CRRT when they are hemodynamically unstable, but transition to IHD as their condition is managed during the admission. While patients requiring CRRT can be more resource intensive, it would not be practical to create new MS–DRGs specifically for this subset of patients given the various clinical presentations for which CRRT may be utilized, and the variation of costs in their assigned MS–DRGs. We believe that additional analysis and efforts toward a broader approach to refining the MS–DRGs for cases of patients requiring renal replacement therapy would be needed to address the concerns expressed by the requestor. These data do show cases reporting the use of CRRT can present greater treatment difficulty. However, when reviewing consumption of hospital resources for this subset of cases, the claims data also suggest that the increased costs may be attributable to the severity of illness of the patient and other circumstances of the admission.

In summary, the claims data reflect a wide variance with regard to the frequency and average costs for cases reporting the use of CRRT. Depending on the number of cases in each MS–DRG, it is difficult to detect patterns of complexity and resource intensity. We believe the creation of new MS–DRGs for cases with procedure codes reporting the use of CRRT has the potential for creating instability in the relative weights and disrupting the integrity of the MS–DRG system. Therefore, we are not proposing to create new MS–DRGs for cases reporting the use of continuous renal replacement therapy.

8. MDC 16 (Diseases and Disorders of Blood, Blood Forming Organs and Immunologic Disorders)

a. ANDEXXA® (Coagulation Factor Xa (Recombinant), Inactivated-zhzo)

ANDEXXA® (coagulation factor Xa (recombinant), inactivated-zhzo) is a recombinant decoy protein that rapidly reverses the anticoagulant effects of two direct oral anticoagulants, apixaban and rivaroxaban, when reversal of anticoagulation is needed due to life-threatening or uncontrolled bleeding in indications such as intracranial hemorrhages (ICHs) and gastrointestinal bleeds (GIBs). ANDEXXA® received FDA approval on May 3, 2018. When administered as a bolus followed by continuous infusion, ANDEXXA® blocks the anticoagulants ability to inhibit FXa. ANDEXXA® was approved for new technology add on payments in FY 2019 (83 FR 41362). We refer readers to section II.H.5.j. of the preamble of the FY 2019 IPPS/LTCH PPS final rule (83 FR 41355 through 41362), and section II.H.4.k. of the preamble of the FY 2020 IPPS/LTCH PPS final rule (84 FR 42193 through 42194) for a complete discussion of the new technology add on payment application and payment amount for ANDEXXA® for FY 2019 and FY 2020.

In section II.H.4.i. of the preamble of the FY 2021 IPPS/LTCH PPS final rule (85 FR 58614 through 58615), we noted the 3-year anniversary date of the entry of ANDEXXA® onto the U.S. market (May 3, 2021) will occur in the second half of FY 2021. We stated in general, we extend new technology add-on payments for an additional year only if the 3-year anniversary date of the product's entry onto the U.S. market occurs in the latter half of the upcoming fiscal year. After consideration of the public comments received, we finalized our proposal to continue new technology add-on payments for this technology for FY 2021.

We received a request from the manufacturer to review potential access issues in the inpatient setting for this drug in the future. The requestor acknowledged that CMS approved the new technology add-on payment for ANDEXXA® beginning in FY 2019 and noted that FY 2021 will be the last year before the add-on payments expire. According to the requestor, ANDEXXA® is the only indicated factor Xa inhibitor reversal agent, and the requestor stated a concern for the future of access to ANDEXXA® for patients experiencing uncontrolled bleeds caused by factor Xa inhibitors. The requestor stated their claims modeling showed a significant drop in hospital payment for cases involving use of ANDEXXA® following the expiration of new technology add-on payments. Specifically, after new technology add-on payments expire, the requestor stated their model projects that approximately 59% of cases are likely to be paid less than the wholesale acquisition costs for ANDEXXA®.

The following ICD–10–PCS procedure codes identify the intravenous administration of ANDEXXA®.

ICD-10-PCS Code	Code Description
XW03372	Introduction of inactivated coagulation factor Xa into peripheral vein, percutaneous approach, new technology group 2
XW04372	Introduction of inactivated coagulation factor Xa into central vein, percutaneous approach, new technology group 2

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure codes XW03372 and XW04372 are designated as non-O.R. procedures for purposes of MS–DRG assignment. Our clinical advisors agree that the principal diagnosis assigned for inpatient admissions where the intravenous administration of ANDEXXA® is indicated can vary.

To evaluate the frequency with which the intravenous administration of

ANDEXXA® is reported for different clinical scenarios, we examined claims data from the March 2020 update of the FY 2019 MedPAR file across the Pre-MDC category, each of the 25 MDCs and the surgical class referred to as ''unrelated operating room procedures'' to determine the number of cases reporting the use of ANDEXXA®. Our findings are shown in the following table.

BILLING CODE 4120–01–P

Cases Reporting ANDEXXA® Therapy			
MDC	**Number of Cases**	**Average Length of Stay**	**Average Costs**
All cases reporting XW03372 or XW04372	461	8.7	$42,734
Pre-MDC--Cases reporting XW03372 or XW04372	16	19.9	$107,741
MDC 01 (Diseases and Disorders of the Nervous System)--Cases reporting XW03372 or XW04372	250	7.2	$37,035
MDC 03 (Diseases and Disorders of the Ear, Nose, Mouth and Throat)--Cases reporting XW03372 or XW04372	2	4	$26,463
MDC 04 (Diseases and Disorders of the Respiratory System)--Cases reporting XW03372 or XW04372	12	5.3	$36,198
MDC 05 (Diseases and Disorders of the Circulatory System)--Cases reporting XW03372 or XW04372	33	16.8	$77,284
MDC 06 (Diseases and Disorders of the Digestive System)--Cases reporting XW03372 or XW04372	53	7.4	$34,485
MDC 07 (Diseases and Disorders of the Hepatobiliary System and Pancreas)--Cases reporting XW03372 or XW04372	2	5	$27,206
MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue)--Cases reporting XW03372 or XW04372	14	7.9	$41,082
MDC 09 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast)--Cases reporting XW03372 or XW04372	1	4	$22,242
MDC 11 (Diseases and Disorders of the Kidney and Urinary Tract)--Cases reporting XW03372 or XW04372	10	7.5	$32,751

Cases Reporting ANDEXXA® Therapy			
MDC	**Number of Cases**	**Average Length of Stay**	**Average Costs**
MDC 12 (Diseases and Disorders of the Male Reproductive System)--Cases reporting XW03372 or XW04372	1	14	$25,975
MDC 16 (Diseases and Disorders of Blood, Blood Forming Organs, Immunologic Disorders)--Cases reporting XW03372 or XW04372	10	7.4	$40,563
MDC 17 (Myeloproliferative Diseases and Disorders, Poorly Differentiated Neoplasms)--Cases reporting XW03372 or XW04372	3	11.7	$36,541
MDC 18 (Infectious and Parasitic Diseases, Systemic or Unspecified Sites)--Cases reporting XW03372 or XW04372	25	11.5	$43,355
MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs)--Cases reporting XW03372 or XW04372	13	6.4	$38,250
MDC 24 (Multiple Significant Trauma)--Cases reporting XW03372 or XW04372	10	10.8	$48,410
MS-DRG 981 (Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC) --Cases reporting XW03372 or XW04372	5	9	$53,775
MS-DRG 987 (Non-Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC) --Cases reporting XW03372 or XW04372	1	12	$31,378

BILLING CODE 4120–01–C

As shown in the table, there were 461 cases reporting the intravenous administration of ANDEXXA® with procedure codes XW03372 or XW04372. The top five MDCs with the largest number of cases reporting ANDEXXA® are MDC 01, with 250 cases; MDC 06 with 53 cases; MDC 05, with 33 cases; MDC 18, with 25 cases; and the Pre-MDC category, with 16 cases. The claims data indicate that the average costs range from a high of $107,741 in the Pre-MDC category to a low of $22,242 in MDC 09 for cases reporting the use of ANDEXXA® across the claims data. The claims data also indicates that the average length of stay ranges from a high of 19.9 days in the Pre-MDC category to a low of 4 days in MDC 09 for cases reporting the use of ANDEXXA®.

We also examined claims data from the September 2020 update of the FY 2020 MedPAR file across the Pre-MDC category, each of the 25 MDCs and the surgical class referred to as ''unrelated operating room procedures'' to determine the number of cases reporting the use of ANDEXXA®. Our findings are shown in the following table.

BILLING CODE 4120–01–P

Cases Reporting ANDEXXA® Therapy			
MDC	**Number of Cases**	**Average Length of Stay**	**Average Costs**
All cases reporting XW03372 or XW04372	719	8.3	$44,393
Pre-MDC--Cases reporting XW03372 or XW04372	28	25	$123,750
MDC 01 (Diseases and Disorders of the Nervous System)--Cases reporting XW03372 or XW04372	364	7.1	$38,841
MDC 04 (Diseases and Disorders of the Respiratory System)--Cases reporting XW03372 or XW04372	13	4.5	$35,988
MDC 05 (Diseases and Disorders of the Circulatory System)--Cases reporting XW03372 or XW04372	50	9.4	$58,583
MDC 06 (Diseases and Disorders of the Digestive System)--Cases reporting XW03372 or XW04372	98	7.8	$39,890
MDC 07 (Diseases and Disorders of the Hepatobiliary System and Pancreas)--Cases reporting XW03372 or XW04372	5	9.2	$31,730
MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue)--Cases reporting XW03372 or XW04372	15	7.4	$45,397
MDC 09 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast)--Cases reporting XW03372 or XW04372	9	4.8	$27,922
MDC 10 (Endocrine, Nutritional and Metabolic Diseases and Disorders)--Cases reporting XW03372 or XW04372	1	8	$33,210

Cases Reporting ANDEXXA® Therapy			
MDC	**Number of Cases**	**Average Length of Stay**	**Average Costs**
MDC 11 (Diseases and Disorders of the Kidney and Urinary Tract)--Cases reporting XW03372 or XW04372	9	8.7	$36,565
MDC 12 (Diseases and Disorders of the Male Reproductive System)--Cases reporting XW03372 or XW04372	1	8	$30,119
MDC 16 (Diseases and Disorders of Blood, Blood Forming Organs, Immunologic Disorders)--Cases reporting XW03372 or XW04372	22	5.7	$28,458
MDC 17 (Myeloproliferative Diseases and Disorders, Poorly Differentiated Neoplasms)--Cases reporting XW03372 or XW04372	1	5	$34,819
MDC 18 (Infectious and Parasitic Diseases, Systemic or Unspecified Sites)--Cases reporting XW03372 or XW04372	52	9.7	$50,963
MDC 19 (Mental Diseases and Disorders)--Cases reporting XW03372 or XW04372	1	15	$37,667
MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs)--Cases reporting XW03372 or XW04372	9	4.2	$27,987
MDC 23 (Factors Influencing Health Status and Other Contacts with Health Services)--Cases reporting XW03372 or XW04372	1	7	$28,405
MDC 24 (Multiple Significant Trauma)--Cases reporting XW03372 or XW04372	30	8.4	$41,478
MS-DRG 981 (Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC) --Cases reporting XW03372 or XW04372	9	11.6	$57,895
MS-DRG 987 (Non-Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC) --Cases reporting XW03372 or XW04372	1	5	$34,910

BILLING CODE 4120–01–C

As shown in the table, there were 719 cases reporting the intravenous administration of ANDEXXA® with procedure codes XW03372 or XW04372. The top five MDCs with the largest number of cases reporting ANDEXXA® are MDC 01, with 364 cases; MDC 06 with 98 cases; MDC 18, with 52 cases; MDC 05, with 50 cases; and MDC 24, with 30 cases. The claims data indicate that the average costs range from a high

of $123,750 in the Pre-MDC category to a low of $27,922 in MDC 09 for cases reporting the use of ANDEXXA® across the claims data. The claims data also indicates that the average length of stay ranges from a high of 25 days in the Pre-MDC category to a low of 4.2 days in MDC 21 for cases reporting the use of ANDEXXA® across the claims data.

To further examine the impact of the intravenous administration of ANDEXXA®, we examined claims data from the March 2020 update of the FY 2019 MedPAR file for the top ten MS–DRGs reporting procedure codes XW03372 or XW04372. Our findings are reflected in the following table:

BILLING CODE 4120–01–P

Top 10 MS-DRGs Reporting ANDEXXA® Therapy

MS-DRG	Description		Number of Cases	Average Length of Stay	Average Costs
064	Intracranial Hemorrhage or Cerebral Infarction with MCC	All cases	77,911	6.1	$13,441
		Cases reporting XW03372 or XW04372	78	6.9	$30,187
023	Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator	All cases	12,867	9.8	$40,511
		Cases reporting XW03372 or XW04372	27	11	$53,956
086	Traumatic Stupor and Coma <1 Hour with CC	All cases	16,035	3.9	$9,214
		Cases reporting XW03372 or XW04372	25	4.2	$28,603
377	Gastrointestinal Hemorrhage with MCC	All cases	68,798	5.7	$12,897
		Cases reporting XW03372 or XW04372	18	8.6	$35,850
025	Craniotomy and Endovascular Intracranial Procedures with MCC	All cases	21,980	8.8	$31,726
		Cases reporting XW03372 or XW04372	17	9	$55,458
083		All cases	10,061	4.3	$9,895

Top 10 MS-DRGs Reporting ANDEXXA® Therapy					
MS-DRG	**Description**		**Number of Cases**	**Average Length of Stay**	**Average Costs**
	Traumatic Stupor and Coma >1 Hour with CC	Cases reporting XW03372 or XW04372	17	4.4	$26,992
082	Traumatic Stupor and Coma >1 Hour with MCC	All cases	6,980	6.4	$16,630
		Cases reporting XW03372 or XW04372	15	7.6	$30,208
085	Traumatic Stupor and Coma <1 Hour with MCC	All cases	8,178	6.5	$16,116
		Cases reporting XW03372 or XW04372	15	6.7	$32,475
065	Intracranial Hemorrhage or Cerebral Infarction with CC or TPA In 24 Hours	All cases	107,737	3.6	$7,375
		Cases reporting XW03372 or XW04372	14	5	$26,992
003	ECMO or Tracheostomy with MV >96 Hours or Principal Diagnosis Except Face Mouth and Neck with Major O.R. Procedures	All cases	14,532	30.2	$128,196
		Cases reporting XW03372 or XW04372	13	21.5	$117,265

BILLING CODE 4120–01–C

As shown in this table, the claims data demonstrate that the MS–DRG with the largest number of cases reporting ANDEXXA® is MS–DRG 064 with 78 cases. Of the top 10 MS–DRGs reporting ANDEXXA®, the MS–DRG with the smallest number of cases is MS–DRG 003 with 13 cases. The average length of stay of this subset of cases ranges from a high of 21.5 days in MS–DRG 003 to a low of 4.2 days in MS–DRG 086 for cases reporting the use of ANDEXXA®. The average costs of this subset of cases ranges from a high of $117,265 in MS–DRG 003 to a low of $26,992 in MS–DRG 083 for cases reporting the use of ANDEXXA®. We note while our data findings demonstrate the average costs were higher for the cases reporting the intravenous administration of ANDEXXA® when compared to all cases in their respective MS–DRG, these cases represent a very small percentage of the total number of cases reported in these MS–DRGs. We also note that the top 10 MS–DRGs identified only account for 239 of the 461 cases in total that were identified in the March 2020 update of the FY 2019 MedPAR file reporting ICD–10–PCS codes XW03372 or XW04372. The remainder of the cases are distributed in small numbers across the MS–DRGs.

We also examined claims data from the September 2020 update of the FY 2020 MedPAR file for the top ten MS–DRGs reporting procedure codes XW03372 or XW04372. Our findings are reflected in the following table:

BILLING CODE 4120–01–P

Top 10 MS-DRGs Reporting ANDEXXA® Therapy					
MS-DRG	Description		Number of Cases	Average Length of Stay	Average Costs
025	Craniotomy and Endovascular Intracranial Procedures with MCC	All cases	19,643	8.7	$32,933
		Cases reporting XW03372 or XW04372	25	9.3	$59,478
023	Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator	All cases	12,042	9.7	$42,273
		Cases reporting XW03372 or XW04372	38	10	$58,749
871	Septicemia or Severe Sepsis without MV >96 Hours with MCC	All cases	552,641	6.4	$14,140
		Cases reporting XW03372 or XW04372	26	9	$46,965
377	Gastrointestinal Hemorrhage with MCC	All cases	60,818	5.6	$13,369
		Cases reporting XW03372 or XW04372	36	6.0	$37,949
085	Traumatic Stupor and Coma <1 Hour with MCC	All cases	7,402	6.4	$16,512
		Cases reporting XW03372 or XW04372	29	8.4	$36,530
064	Intracranial Hemorrhage or Cerebral Infarction with MCC	All cases	68,674	6	$13,997
		Cases reporting XW03372 or XW04372	111	6.8	$34,892
083	Traumatic Stupor and Coma >1 Hour with CC	All cases	9,036	4.2	$10,419
		Cases reporting XW03372 or XW04372	23	4.7	$32,678
065	Intracranial Hemorrhage or Cerebral Infarction with CC or TPA In 24 Hours	All cases	86,862	3.5	$7,583
		Cases reporting XW03372 or XW04372	32	5.2	$31,535
086	Traumatic Stupor and Coma <1 Hour with CC	All cases	13,298	3.7	$9,592
		Cases reporting XW03372 or XW04372	41	4.4	$29,221
378	Gastrointestinal Hemorrhage with CC	All cases	101,534	3.5	$7,577
		Cases reporting XW03372 or XW04372	24	3.5	$24,348

BILLING CODE 4120–01–C

As shown in this table, the claims data demonstrate that the MS–DRG with the largest number of cases reporting ANDEXXA® is MS–DRG 064 with 111 cases. Of the top 10 MS–DRGs reporting ANDEXXA®, the MS–DRG with the smallest number of cases is MS–DRG 083 with 23 cases. The average length of stay of this subset of cases ranges from a high of 10 days in MS–DRG 023 to a low of 3.5 days in MS–DRG 378 for cases reporting the use of ANDEXXA®. The average costs of this subset of cases ranges from a high of $59,478 in MS–DRG 025 to a low of $24,348 in MS–DRG 378 for cases reporting the use of ANDEXXA®. As with our analysis of the

FY 2019 claims data, while these data findings demonstrate the average costs were higher for the cases reporting the intravenous administration of ANDEXXA® when compared to all cases in their respective MS–DRG, these cases represent a very small percentage of the total number of cases reported in these MS–DRGs. We also note that the top 10 MS–DRGs identified only account for 385 of the 719 cases in total that were identified in the September 2020 update of the FY 2020 MedPAR file reporting ICD–10–PCS codes XW03372 or XW04372. The remainder of the cases are distributed in small numbers across the MS–DRGs.

After reviewing the claims data, we believe it is premature to consider a proposal for cases involving ANDEXXA® therapy for FY 2022. While the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file do contain claims reporting the procedure codes identifying the intravenous administration of ANDEXXA®, the number of cases is small across the MDCs and MS–DRGs. The claims data also reflect a wide variance with regard to the frequency and average costs for these cases reporting the use of ANDEXXA®. Moreover, we were unable to identify another MS–DRG that would be a more appropriate MS–DRG assignment for these cases based on the indication for this therapeutic drug. As noted previously, ANDEXXA® reverses the anticoagulant effects of apixaban and rivaroxaban, when reversal of anticoagulation is needed due to life-threatening or uncontrolled bleeding. The underlying cause of the life-threatening or uncontrolled bleeding can vary which means the principal diagnosis assigned for inpatient admissions where ANDEXXA® is administered can vary. The MS–DRGs are a classification system intended to group together diagnoses and procedures with similar clinical characteristics and utilization of resources. We generally seek to identify sufficiently large sets of claims data with a resource/cost similarity and clinical similarity in developing diagnostic-related groups rather than smaller subsets based on the drugs administered. In reviewing this issue, our clinical advisors expressed concern regarding making potential MS–DRG changes based on a specific, single therapeutic agent, identified by unique procedure codes rather than based on a group of related procedure codes that can be reported to describe that same type or class of treatment or technology, which is more consistent with the intent of the MS–DRGs.

We recognize the average costs of the small numbers of cases involving the intravenous administration of ANDEXXA® are greater when compared to the average costs of all cases in their respective MS–DRG. The MS–DRG system is a system of averages and it is expected that within the diagnostic related groups, some cases may demonstrate higher than average costs, while other cases may demonstrate lower than average costs. We further note that section 1886(d)(5)(A) of the Act provides for Medicare payments to Medicare-participating hospitals in addition to the basic prospective payments for cases incurring extraordinarily high costs.

We acknowledge the importance of ensuring that patients diagnosed with an indication for a factor Xa inhibitor reversal agent have adequate access to care and receive the necessary treatment. While we are sensitive to the requestors' concerns about continued access to treatment for beneficiaries who require the reversal of anticoagulation due to life-threatening or uncontrolled bleeding, additional time is needed to explore options and other mechanisms through which to address low volume high-cost drugs outside of the MS–DRGs.

Furthermore, we note that we are proposing to continue new technology add-on payments for ANDEXXA® for FY 2022. We refer the reader to section II.F.4.b of the preamble of this proposed rule for further discussion regarding our proposal to allow a one-time extension of new technology add-on payments for FY 2022 for 15 technologies for which the new technology add-on payment would otherwise be discontinued, in connection with our proposal to use the FY 2019 data to develop the proposed FY 2022 relative weights.

Therefore for the reasons stated previously, for FY 2022 we are not proposing any MS–DRG changes for cases involving the intravenous administration of ANDEXXA®.

b. Cytokine Release Syndrome (CRS) Logic

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58557 through 58561), we finalized modifications to the proposed severity level designations for a subset of the diagnosis codes describing Cytokine Release Syndrome (CRS) based upon further review of the conditions and in response to public comments. We provided the following table to display the finalized severity level designations and stated that we will continue to monitor the CRS codes and their impact on resource use once the claims data becomes available to determine if further modifications to the severity level are warranted.

ICD-10-CM Code	Description	Proposed Severity Level	Finalized Severity Level
D89.83l	Cytokine release syndrome, grade 1	NonCC	NonCC
D89.832	Cytokine release syndrome, grade 2	NonCC	NonCC
D89.833	Cytokine release syndrome, grade 3	NonCC	CC
D89.834	Cytokine release syndrome, grade 4	NonCC	CC
D89.835	Cytokine release syndrome, grade 5	NonCC	CC
D89.839	Cytokine release syndrome, grade unspecified	NonCC	NonCC

In connection with the finalized severity level designations for the listed CRS codes, we also finalized modifications to the ICD–10 MS–DRG GROUPER logic V38 for MS–DRGs 814, 815, and 816 (Reticuloendothelial and Immunity Disorders with MCC, with CC, and without CC/MCC, respectively) to conform to the updates the CDC finalized in the ICD–10–CM Tabular List instructions for assigning and reporting the CRS codes effective with discharges on and after October 1, 2020. The following modifications to the GROUPER logic were finalized effective with discharges on and after October 1, 2020, for case assignment involving CRS following CAR T-cell therapy to MS–

DRGs 814, 815, and 816. We noted that the GROUPER logic for MS–DRGs 814, 815, and 816 will include a principal diagnosis of T89.89XA with a secondary diagnosis of any CRS code as shown in this section of this proposed rule.

Principal Diagnosis

T80.89XA Other complications following infusion, transfusion and therapeutic injection, initial encounter

with

Secondary Diagnosis

D89.831 Cytokine release syndrome, grade 1
D89.832 Cytokine release syndrome, grade 2
D89.833 Cytokine release syndrome, grade 3
D89.834 Cytokine release syndrome, grade 4
D89.835 Cytokine release syndrome, grade 5
D89.839 Cytokine release syndrome, grade unspecified

As discussed in section II.D.13 of the preamble of this proposed rule, Table 6A.-New Diagnosis Codes, lists the new diagnosis codes that have been approved to date and will be effective with discharges on and after October 1, 2021. Included in Table 6A are the following codes that describe complication of immune effector cellular therapy identifying the timeframe of the encounter.

ICD-10-CM Code	Description
T80.82XA	Complication of immune effector cellular therapy, initial encounter
T80.82XD	Complication of immune effector cellular therapy, subsequent encounter
T80.82XS	Complication of immune effector cellular therapy, sequela

Also included in Table 6A are the following diagnosis codes that describe immune effector cell-associated neurotoxicity syndrome (ICANS), with varying degrees of severity.

ICD-10-CM Code	Description
G92.00	Immune effector cell-associated neurotoxicity syndrome, grade unspecified
G92.01	Immune effector cell-associated neurotoxicity syndrome, grade 1
G92.02	Immune effector cell-associated neurotoxicity syndrome, grade 2
G92.03	Immune effector cell-associated neurotoxicity syndrome, grade 3
G92.04	Immune effector cell-associated neurotoxicity syndrome, grade 4
G92.05	Immune effector cell-associated neurotoxicity syndrome, grade 5

Consistent with the Tabular List instruction for these two sets of diagnosis codes as presented and discussed by the CDC at the September 8–9, 2020 ICD–10 Coordination and Maintenance Committee meeting, the diagnosis codes describing a complication of the immune effector cellular therapy (T80.82XA, T80.82XD, and T80.82XS) are to be sequenced first, followed by the applicable diagnosis code to identify the specified condition resulting from the complication. For example, the types of complications that may result from immune effector cellular therapy treatment (for example, CAR T-cell therapy) include ICANS or CRS, as described by the listed diagnosis codes. Accordingly, the CDC included the following instructional note in the Tabular List modifications for code T80.82–

''Use additional code to identify the specific complication, such as: cytokine release syndrome (D89.83–) immune effector cell-associated neurotoxicity syndrome (G92.0–)''

Materials relating to the discussions involving the diagnosis codes from the September 8–9, 2020 ICD–10 Coordination and Maintenance Committee meeting can be obtained from the CDC website at: *https://www.cdc.gov/nchs/icd/icd10cm_maintenance.htm*.

As noted previously, the current logic for case assignment involving CRS following CAR T-cell therapy to MS–DRGs 814, 815, and 816 includes a principal diagnosis of T89.89XA with a secondary diagnosis of any CRS code. However, with the finalization of new diagnosis code T80.82-, diagnosis code T89.89XA would no longer be reported and these cases would instead report new diagnosis code T80.82XA, effective with discharges on and after October 1, 2020. As shown in Table 6A associated with this proposed rule, we are proposing to assign diagnosis code T80.82XA to MDC 16 (Diseases and Disorders of Blood, Blood Forming Organs, and Immunologic Disorders) in MS–DRGs 814, 815, and 816. If the MDC and MS–DRG assignment for new diagnosis code T80.82XA is finalized, the current logic for MS–DRGs 814, 815, and 816 that includes a principal diagnosis code of T89.89XA with a secondary diagnosis code of any CRS code would no longer be appropriate or necessary.

Therefore, we are proposing to revise the structure of MS–DRGs 814, 815, and 816 by removing the logic that includes a principal diagnosis of T89.89XA with a secondary diagnosis of any CRS code from MS–DRGs 814, 815, and 816 effective FY 2022.

9. MDC 17 (Myeloproliferative Diseases and Disorders, and Poorly Differentiated Neoplasms): Inferior Vena Cava Filter Procedures

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58517 through 58520), we

discussed the ICD–10–PCS codes that describe the insertion of an intraluminal device into the inferior vena cava that are listed in the following table.

ICD-10-PCS Code	Code Description
06H003T	Insertion of infusion device, via umbilical vein, into inferior vena cava, open approach
06H003Z	Insertion of infusion device, into inferior vena cava, open approach
06H00DZ	Insertion of intraluminal device, into inferior vena cava, open approach
06H033T	Insertion of infusion device, via umbilical vein, into inferior vena cava, percutaneous approach
06H033Z	Insertion of infusion device, into inferior vena cava, percutaneous approach
06H03DZ	Insertion of intraluminal device, into inferior vena cava, percutaneous approach
06H043Z	Insertion of infusion device, into inferior vena cava, percutaneous endoscopic approach
06H04DZ	Insertion of intraluminal device, into inferior vena cava, percutaneous endoscopic approach

We finalized a change in the designation of ICD–10–PCS procedure code 06H03DZ from O.R. procedure to non-O.R. procedure and maintained the O.R. designation of procedure codes 06H00DZ and 06H04DZ. In that discussion, we noted our clinical advisors supported changing the O.R. designation of procedures describing insertion of an intraluminal device into the inferior vena cava performed via a percutaneous approach since the procedure does not require the resources of an operating room, while concurring that procedures describing the insertion of an intraluminal device into the inferior vena cava performed via an open or a percutaneous endoscopic approach could require greater resources than a procedure describing insertion of an intraluminal device into the inferior vena cava performed via a percutaneous approach. We also noted that the goals of changing the designation of procedures from non-O.R. to O.R., or vice versa, are to better clinically represent the resources involved in caring for these patients and to enhance the overall accuracy of the system and not whether the change in designation would impact payment in a particular direction.

In response to this final policy, for this FY 2022 IPPS/LTCH PPS proposed rule, we received a request to revise MS–DRGs 829 and 830 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Other Procedures with and without CC/MCC, respectively) by removing the current two-way severity level split and creating a three-way severity level split. The requestor respectfully disagreed with the FY 2021 IPPS/LTCH PPS final rule decision to change the designation of the procedure code describing the insertion of an inferior vena cava intraluminal device via percutaneous approach to a non-O.R. procedure, and stated vena cava filters are most often placed in interventional radiology suites and require a high level of skill to prevent rupture of the vena cava; and although they are long-term devices, they must be placed skillfully to allow for removal later if needed.

According to the requestor, it is a conundrum that patients with principal and secondary diagnoses that qualify for medical MS–DRGs 837 (Chemotherapy with Acute Leukemia as Secondary Diagnosis or with High Dose Chemotherapy Agent with MCC), MS–DRG 838 (Chemotherapy with Acute Leukemia as Secondary Diagnosis with CC or High Dose Chemotherapy Agent), and MS–DRG 839 (Chemotherapy with Acute Leukemia as Secondary Diagnosis without CC/MCC) group to lower weighted surgical MS–DRGs 829 and 830 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Other Procedures with and without CC/MCC, respectively) when a non-major O.R. procedure is performed. The requestor stated the difference in relative weights might be occurring because of the two-way split within MS–DRGs 829 and 830 and the three-way split within MS–DRGs 837, 838 and 839. The requestor theorized that removing the current two-way severity level split of MS–DRGs 829 and 830 and creating a three-way severity level split could help resolve the relative weight discrepancy when any non-major O.R. procedures are performed during hospitalizations for chemotherapy for acute leukemia.

This requestor also suggested that if CMS' analysis did not support creating a three-way split for MS–DRGs 829 and 830, exclusion of PCS code 06H03DZ from the list of qualifying procedures and reinstatement of O.R. procedure status to appropriately compensate providers for the cost of devices and resources to place inferior vena cava filters across the patient population should be proposed.

To evaluate the request to create a three-way severity split MS–DRG for cases reporting myeloproliferative disorders or poorly differentiated neoplasms with other procedures, we conducted an analysis of base MS–DRG 829. This analysis includes 2 years of MedPAR claims data to compare the data results from 1 year to the next to avoid making determinations about whether additional severity levels are warranted based on an isolated year's data fluctuation and also, to validate that the established severity levels within a base MS–DRG are supported.

Therefore, we reviewed the claims data for base MS–DRG 829 using the September 2018 update of the FY 2018 MedPAR file and the March 2020 update of the FY 2019 MedPAR file, which were used in our analysis of claims data for MS–DRG reclassification requests for FY 2020 and FY 2022, respectively. Our findings are shown in the table:

FY Data	Number of Cases	Number of Cases MCC	Number of Cases CC	Number of Cases NonCC	Average Costs No Split	Average Costs MCC	Average Costs CC	Average Costs NonCC	Average Costs MCC/CC combo	Average Costs CC/NonCC combo
2019	2,099	686	1,080	333	$21,657	$35,618	$16,103	$10,909	$23,684	$14,879
2018	2,116	668	1,115	333	$20,355	$33,693	$15,513	$9,811	$22,324	$14,202

We applied the criteria to create subgroups for the three-way severity level split. We found that the criterion that there be at least 500 cases for each subgroup was not met based on the data in both the FY 2018 and FY 2019 MedPAR files, as shown in the table for both years. Specifically, for the ''with MCC'', ''with CC'', and ''without CC/MCC'' split, there were only 333 cases in the ''without CC/MCC'' subgroup based on the data in the FY 2019 MedPAR file and only 333 cases in the ''without CC/MCC'' subgroup based on the data in the FY 2018 MedPAR file. Accordingly, the claims data do not support a three-way severity level split for base MS–DRG 829.

We also reviewed the claims data for base MS–DRG 829 using the September 2019 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file, which were used in our analysis of claims data for MS–DRG reclassification requests for FY 2021 and FY 2022, respectively. Our findings are shown in the table:

FY Data	Number of Cases	Number of Cases MCC	Number of Cases CC	Number of Cases NonCC	Average Costs No Split	Average Costs MCC	Average Costs CC	Average Costs NonCC	Average Costs MCC/CC combo	Average Costs CC/NonCC combo
2020	1,993	647	1,043	303	$20,494	$31,734	$16,220	$11,204	$22,159	$15,091
2019	2,099	686	1,080	333	$21,657	$35,618	$16,103	$10,909	$23,684	$14,879

We applied the criteria to create subgroups for the three-way severity level split. We found that the criterion that there be at least 500 cases for each subgroup was not met based on the data in both the FY 2019 and FY 2020 MedPAR files, as shown in the table for both years. Specifically, for the ''with MCC'', ''with CC'', and ''without CC/MCC'' split, there were only 303 cases in the ''without CC/MCC'' subgroup based on the data in the FY 2020 MedPAR file and, as previously noted, only 333 cases in the ''without CC/MCC'' subgroup based on the data in the FY 2019 MedPAR file. As shown in both sets of data and stated previously, the claims data do not support a three-way severity level split for base MS–DRG 829.

In response to the request to exclude ICD–10–PCS code 06H03DZ from a list of qualifying procedures if CMS's analysis did not support creating a three-way split for MS–DRGs 829 and 830, by definition, procedure codes designated as non-O.R. procedures, not further classified as ''affecting the MS–DRG assignment'', do not influence the MS–DRG assignment. As stated previously, in the FY 2021 IPPS/LTCH PPS final rule we finalized our proposal to change the designation of ICD–10–PCS procedure code 06H03DZ from O.R. procedure to non-O.R. procedure, therefore as a non-O.R. procedure, there is no need to exclude ICD–10–PCS code 06H03DZ from a list of qualifying procedure codes for MS–DRGs 829 and 830.

In response to the request to reinstate the O.R. procedure designation of ICD–10–PCS code 06H03DZ if CMS's analysis did not support creating a three-way split for MS–DRGs 829 and 830, the change in designation from O.R. procedure to non-O.R. procedure is recent, only becoming effective October 1, 2020. Our clinical advisors continue to indicate that code 06H03DZ, describing the percutaneous insertion of an intraluminal device into the inferior vena cava, does not require the resources of an operating room, that the procedure to insert an IVC filter percutaneously is not surgical in nature and that the resources involved in furnishing this procedure are comparable to the related ICD–10–PCS procedure codes that describe the insertion of infusion devices into the inferior vena cava that are currently designated as non-O.R. procedures. Our clinical advisors state our FY 2021 final policy results in an O.R. designation of 06H03DZ that better reflects the associated technical complexity and hospital resource use of this procedure. We continue to explore alternatives on how we may restructure the current O.R. and non-O.R. designations for procedures by leveraging the detail that is now available in the ICD–10 claims data, as discussed in the FY 2021 IPPS/LTCH PPS final rule and in section II.D.11. of the preamble of this proposed rule. We continue to develop our process and methodology, and will provide more detail in future rulemaking.

In summary, based on the results of our analysis, for FY 2022, we are proposing to maintain the current structure of MS–DRGs 829 and 830.

10. Review of Procedure Codes in MS–DRGs 981 Through 983 and 987 Through 989

We annually conduct a review of procedures producing assignment to MS–DRGs 981 through 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) or MS–DRGs 987 through 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) on the basis of volume, by procedure, to see if it would be appropriate to move cases reporting these procedure codes out of these MS–DRGs into one of the surgical MS–DRGs for the MDC into which the principal diagnosis falls. The data are arrayed in two ways for comparison purposes. We look at a frequency count of each major operative procedure code. We also compare procedures across MDCs by volume of procedure codes within each MDC. We use this information to determine which procedure codes and diagnosis codes to examine.

We identify those procedures occurring in conjunction with certain principal diagnoses with sufficient frequency to justify adding them to one of the surgical MS–DRGs for the MDC in which the diagnosis falls. We also consider whether it would be more appropriate to move the principal diagnosis codes into the MDC to which the procedure is currently assigned.

In addition to this internal review, we also consider requests that we receive to examine cases found to group to MS–DRGs 981 through 983 or MS–DRGs 987 through 989 to determine if it would be appropriate to add procedure codes to one of the surgical MS DRGs for the MDC into which the principal diagnosis falls or to move the principal diagnosis to the surgical MS DRGs to which the procedure codes are assigned.

Based on the results of our review of the claims data from the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file, as well as our review of the requests that we received to examine cases found to group to MS–DRGs 981 through 983 or MS–DRGs 987 through 989, we are proposing to move the cases reporting the procedures and/or principal diagnosis codes described in this section of this rule from MS–DRGs 981 through 983 or MS–DRGs 987 through 989 into one of the surgical MS–DRGs for the MDC into which the principal diagnosis or procedure is assigned.

As discussed in section II.D.3.b. of the preamble of this proposed rule, we received a request to reassign cases with procedures describing control of bleeding in the cranial cavity when reported with a central nervous system diagnosis from MS–DRGs 981, 982, and 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) to MDC 01 (Diseases and Disorders of the Central Nervous System) in MS–DRGs 25, 26, and 27 (Craniotomy and Endovascular Intracranial Procedures with MCC, with CC, and without CC/MCC, respectively (for example, ''craniotomy'' MS–DRGs). We note that in addition to MS–DRGs 25, 26, and 27, MS–DRG 23 (Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator) and MS–DRG 24 (Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis without MCC) also include procedures performed on structures located within the cranial cavity and are included in the range of MS–DRGs known as the ''craniotomy'' MS–DRGs in MDC 01.

The management and treatment for bleeding (or hemorrhage) within the cranial cavity varies depending on the location, cause and the severity (or extent) of the bleed. Common causes include head trauma or cerebral aneurysm. Control of bleeding in the cranial cavity procedures are identified by ICD–10–PCS procedure codes 0W310ZZ (Control bleeding in cranial cavity, open approach), 0W313ZZ (Control bleeding in cranial cavity, percutaneous approach) and 0W314ZZ (Control bleeding in cranial cavity, percutaneous endoscopic approach) and are currently assigned to the following MDCs and MS–DRGs.

BILLING CODE 4120–01–P

MDC	Description	MS-DRG	Description
03	Diseases and Disorders of the Ear, Nose, Mouth and Throat	143	Other Ear, Nose, Mouth and Throat O.R. Procedures with MCC
		144	Other Ear, Nose, Mouth and Throat O.R. Procedures with CC
		145	Other Ear, Nose, Mouth and Throat O.R. Procedures without CC/MCC
05	Diseases and Disorders of the Circulatory System	264	Other Circulatory System O.R. Procedures
10	Endocrine, Nutritional and Metabolic Diseases and Disorders	628	Other Endocrine, Nutritional and Metabolic O.R. Procedures with MCC
		629	Other Endocrine, Nutritional and Metabolic O.R. Procedures with CC
		630	Other Endocrine, Nutritional and Metabolic O.R. Procedures without CC/MCC
17	Myeloproliferative Diseases and Disorders, and Poorly Differentiated Neoplasms	820	Lymphoma and Leukemia with Major O.R. Procedures with MCC

		822	Lymphoma and Leukemia with Major O.R. Procedures without CC/MCC
		826	Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures with MCC
		827	Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures with CC
		828	Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures without CC/MCC
21	Injuries, Poisonings and Toxic Effects of Drugs	907	Other O.R. Procedures for Injuries with MCC
		908	Other O.R. Procedures for Injuries with CC
		909	Other O.R. Procedures for Injuries without CC/MCC
24	Multiple Significant Trauma	957	Other O.R. Procedures for Multiple Significant Trauma with MCC
		958	Other O.R. Procedures for Multiple Significant Trauma with CC
		959	Other O.R. Procedures for Multiple Significant Trauma without CC/MCC

BILLING CODE 4120–01–C

According to the requestor, procedures performed within the cranial cavity always involve drilling or cutting through the skull regardless of the

approach, therefore the three procedure codes identified (0W310ZZ, 0W313ZZ, and 0W314ZZ) warrant assignment to the ''craniotomy'' MS–DRGs.

Our analysis of this grouping issue confirmed that when a procedure describing control of bleeding in the cranial cavity is reported with a principal diagnosis from MDC 01, these cases group to MS–DRGs 981, 982, and 983. Whenever there is a surgical procedure reported on the claim that is unrelated to the MDC to which the case was assigned based on the principal diagnosis, it results in a MS–DRG assignment to a surgical class referred to as ''unrelated operating room procedures''.

We examined claims data from the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file for cases reporting any one of the three procedure codes (0W310ZZ, 0W313ZZ or 0W314ZZ) in MS–DRGs 981 through 983 with a principal diagnosis from MDC 01. Our findings are shown in the following tables.

MS-DRGs 981-983: Cases Reporting Procedures Describing Control of Bleeding in Cranial Cavity with a Principal Diagnosis from MDC 01 – FY 2019

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
981 -	All cases	26,451	11.7	$32,022
981 -	Cases reporting procedures describing control of bleeding in cranial cavity with a principal diagnosis from MDC 01	8	9.8	$30,843
982 -	All cases	13,853	6.2	$18,176
982 -	Cases reporting procedures describing control of bleeding in cranial cavity with a principal diagnosis from MDC 01	1	9.0	$51,234
983-	All cases	2,652	3.0	$12,163
983 -	Cases reporting procedures describing control of bleeding in cranial cavity with a principal diagnosis from MDC 01	1	4.0	$14,934

MS-DRGs 981-983: Cases Reporting Procedures Describing Control of Bleeding in Cranial Cavity with a Principal Diagnosis from MDC 01 – FY 2020

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
981 -	All cases	22,819	11.5	$33,620
981 -	Cases reporting procedures describing control of bleeding in cranial cavity with a principal diagnosis from MDC 01	1	18.0	$38,565
982 -	All cases	11,052	6.0	$18,608
983 -	All cases	2,003	2.7	$13,396
983 -	Cases reporting procedures describing control of bleeding in cranial cavity with a principal diagnosis from MDC 01	1	4.0	$9,152

As noted previously, the requestor asked that we consider reassignment of these cases to the craniotomy MS–DRGs (identified as MS–DRGs 23, 24, 25, 26, and 27). We therefore examined the data for all cases in MS–DRGs 23, 24, 25, 26, and 27. Our findings are shown in the following tables.

MS-DRGs 23 through 27: All Cases – FY 2019			
MS-DRG	Number of Cases	Average Length of Stay	Average Costs
23 - All cases	12,867	9.8	$40,511
24 - All cases	4,624	5.2	$28,583
25 - All cases	21,980	8.8	$31,726
26 - All cases	9,547	5.3	$22,347
27 - All cases	10,495	2.5	$18,574

MS-DRGs 23 through 27: All Cases – FY 2020			
MS-DRG	Number of Cases	Average Length of Stay	Average Costs
23 - All cases	12,042	9.7	$42,273
24 - All cases	4,087	5.1	$30,278
25 - All cases	19,643	8.7	$32,933
26 - All cases	7,609	5.2	$23,226
27 - All cases	7,866	2.4	$19,427

As shown, in our analyses of the claims data for MS–DRGs 981 through 983, we found a total of ten cases reporting procedures describing control of bleeding in cranial cavity with a principal diagnosis from MDC 01 in the March 2020 update of the FY 2019 MedPAR file, and a total of two cases reporting procedures describing control of bleeding in cranial cavity with a principal diagnosis from MDC 01 in the September 2020 update of the FY 2020 MedPAR file.

Our clinical advisors stated these procedures describing control of bleeding in the cranial cavity are consistent with the existing procedure codes included in the logic for case assignment to MS–DRGs 25, 26, and 27, in addition to MS–DRG 23 (Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator) and MS–DRG 24 (Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis without MCC) that also describe procedures performed on structures located within the cranial cavity and are included in the range of MS–DRGs known as the ''craniotomy'' MS–DRGs. While the claims analysis based on the March 2020 update of the FY 2019 MedPAR file identified only ten cases and the September 2020 update of the FY 2020 MedPAR file identified only two cases for which these procedures were reported as a stand-alone procedure resulting in assignment to MS–DRGs 981 through 983, and the average length of stay and average costs for these cases vary in comparison to the average length of stay and average costs of all cases in MS–DRGs 23, 24, 25, 26, and 27, given the nature of head trauma cases, the resource use would be expected to vary based on the extent of the patient's injuries. We believe it is clinically appropriate to add these procedure codes describing control of bleeding in the cranial cavity to MS–DRGs 23, 24, 25, 26, and 27 in MDC 01.

Therefore, we are proposing to add procedure codes 0W310ZZ, 0W313ZZ, and 0W314ZZ to MDC 01 in MS–DRGs 23, 24, 25, 26, and 27 (''craniotomy'' MS–DRGs) for FY 2022.

We also review the list of ICD–10–PCS procedures that, when in combination with their principal diagnosis code, result in assignment to MS–DRGs 981 through 983, or 987 through 989, to ascertain whether any of those procedures should be reassigned from one of those two groups of MS–DRGs to the other group of MS–DRGs based on average costs and the length of stay. We look at the data for trends such as shifts in treatment practice or reporting practice that would make the resulting MS–DRG assignment illogical. If we find these shifts, we would propose to move cases to keep the MS–DRGs clinically similar or to provide payment for the cases in a similar manner.

In addition to this internal review, we also consider requests that we receive to examine cases found to group to MS–DRGs 981 through 983 or MS–DRGs 987 through 989 to determine if it would be appropriate for the cases to be reassigned from one of the MS–DRG groups to the other.

Based on the results of our review of the claims data from the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file, as well as our review of the requests that we received to examine cases found to group to MS–DRGs 981 through 983 or MS–DRGs 987 through 989, we are proposing to move the cases reporting the procedures codes described in this section of this rule from MS–DRGs 981 through 983 to MS–DRGs 987 through 989.

As discussed in section II.D.3.a. of the preamble of this proposed rule, we received a request that we understood to be for our consideration of the reassignment of the following three procedure codes from Extensive O.R. procedures to Non-extensive O.R. procedures.

ICD-10-PCS Code	Description
0JB60ZZ	Excision of chest subcutaneous tissue and fascia, open approach
0JB70ZZ	Excision of back subcutaneous tissue and fascia, open approach
0JB80ZZ	Excision of abdomen subcutaneous tissue and fascia, open approach

In conducting our review of this request, our clinical advisors noted that ICD–10–PCS codes 0JB60ZZ, 0JB70ZZ, and 0JB80ZZ currently group to MS–DRGs 981 through 983 when reported with a principal diagnosis that is not assigned to one of the MDCs to which these procedure codes are assigned. While our claims analysis of both the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file did not identify any cases reporting any one of the three listed procedure codes in MS–DRGs 981, 982, or 983, our clinical advisors believe that these procedures would be more appropriately designated as Non-extensive procedures because they are more consistent with other procedures on the Non-extensive procedure code list. They stated that these procedures do not consume the resources or require a similar level of technical complexity as the procedures on the Extensive O.R. procedures list.

Therefore, we are proposing to reassign the three procedure codes listed from MS–DRGs 981, 982, and 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, without CC/MCC, respectively) to MS–DRGs 987, 988, and 989 (Non-Extensive Procedure Unrelated to Principal Diagnosis with MCC, with CC, without CC/MCC, respectively) for FY 2022.

As discussed in section II.D.4.b. of the preamble of this proposed rule, we identified 17 procedure codes describing laser interstitial thermal therapy (LITT) that are currently designated as extensive O.R. procedures. In addition to those 17 procedure codes, we identified additional procedure codes describing LITT of various body parts that are also designated as extensive O.R. procedures. The ICD–10–PCS codes describing LITT of various body parts are as follows.

ICD-10-PCS Code	Description
D0Y0KZZ	Laser interstitial thermal therapy of brain
D0Y1KZZ	Laser interstitial thermal therapy of brain stem
D0Y6KZZ	Laser interstitial thermal therapy of spinal cord
D0Y7KZZ	Laser interstitial thermal therapy of peripheral nerve
DBY0KZZ	Laser interstitial thermal therapy of trachea
DBY1KZZ	Laser interstitial thermal therapy of bronchus
DBY2KZZ	Laser interstitial thermal therapy of lung
DBY5KZZ	Laser interstitial thermal therapy of pleura
DBY6KZZ	Laser interstitial thermal therapy of mediastinum
DBY7KZZ	Laser interstitial thermal therapy of chest wall
DBY8KZZ	Laser interstitial thermal therapy of diaphragm
DDY0KZZ	Laser interstitial thermal therapy of esophagus
DDY1KZZ	Laser interstitial thermal therapy of stomach
DDY2KZZ	Laser interstitial thermal therapy of duodenum
DDY3KZZ	Laser interstitial thermal therapy of jejunum
DDY4KZZ	Laser interstitial thermal therapy of ileum
DDY5KZZ	Laser interstitial thermal therapy of colon
DDY7KZZ	Laser interstitial thermal therapy of rectum
DDY8KZZ	Laser interstitial thermal therapy of anus
DFY0KZZ	Laser interstitial thermal therapy of liver
DFY1KZZ	Laser interstitial thermal therapy of gallbladder
DFY2KZZ	Laser interstitial thermal therapy of bile ducts
DFY3KZZ	Laser interstitial thermal therapy of pancreas
DGY0KZZ	Laser interstitial thermal therapy of pituitary gland
DGY1KZZ	Laser interstitial thermal therapy of pineal body
DGY2KZZ	Laser interstitial thermal therapy of adrenal glands
DGY4KZZ	Laser interstitial thermal therapy of parathyroid glands
DGY5KZZ	Laser interstitial thermal therapy of thyroid
DMY0KZZ	Laser interstitial thermal therapy of left breast
DMY1KZZ	Laser interstitial thermal therapy of right breast
DVY0KZZ	Laser interstitial thermal therapy of prostate

Whenever one of these listed procedure codes is reported on a claim that is unrelated to the MDC to which the case was assigned based on the principal diagnosis, it currently results in assignment to MS–DRGs 981, 982, and 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, without CC/MCC, respectively). Our clinical advisors stated that all of the listed procedure codes warrant redesignation from the extensive procedure list and MS–DRGs 981, 982, and 983 to the non-extensive procedure list and to MS–DRGs 987, 988, and 989 (Non-Extensive Procedure Unrelated to Principal Diagnosis with MCC, with CC, without CC/MCC, respectively). Specifically, our clinical advisors stated the procedures described by these codes are minimally invasive and are consistent with other ablation (root operation Destruction) type procedures that are designated as non-extensive procedures in the ICD–10–PCS classification.

In our analysis of claims from the March 2020 update of the FY 2019 MedPAR file, we identified a total of six cases reporting procedure codes describing LITT of various body sites in MS–DRGs 981, 982, and 983 with an average length of stay of 2.5 days and average costs of $7,734. Specifically, we found one case reporting procedure code DVY0KZZ (Laser interstitial thermal therapy of prostate) in MS–DRG 981 with an average length of stay of 4.0 days and average costs of $7,348. For MS–DRG 982, we found five cases in which procedure codes describing LITT of various body sites were reported. The first case reported procedure code D0Y0KZZ (Laser interstitial thermal therapy of brain) with an average length of stay of 1.0 day and average costs of $4,142, the second case reported procedure code D0Y6KZZ (Laser interstitial thermal therapy of spinal cord) with an average length of stay of 3.0 days and average costs of $20,007, the third case reported procedure code DDY1KZZ (Laser interstitial thermal therapy of stomach) with an average length of stay of 2.0 days and average costs of $3,424, the fourth case reported procedure code DDY7KZZ (Laser interstitial thermal therapy of rectum) with an average length of stay of 3.0 days and average costs of $3,735, and

the fifth case reported procedure code DVY0KZZ (Laser interstitial thermal therapy of prostate) with an average length of stay of 2.0 days and average costs of $7,750. There were no cases found to report procedures describing LITT in MS–DRG 983. Our findings are summarized in the following table.

MS-DRGs 981-983: Cases Reporting Procedures Describing LITT – FY 2019

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
981 - All cases	26,451	11.7	$32,022
981 - Cases reporting procedures describing LITT	1	4.0	$7,348
982 - All cases	13,853	6.2	$18,176
982 - Cases reporting procedures describing LITT	5	2.2	$7,812
983- All cases	2,652	3.0	$12,163
Total	6	2.5	$7,734

In our analysis of claims from the September 2020 update of the FY 2020 MedPAR file, we identified one case reporting procedure code D0Y6KZZ (Laser interstitial thermal therapy of spinal cord) with an average length of stay of 6 days and average costs of $5,130, and two cases reporting procedure code DVY0KZZ (Laser interstitial thermal therapy of prostate) with an average length of stay of 8.5 days and average costs of $20,329 in MS–DRGs 981, 982, or 983. Although our claims analysis identified a limited number of cases reporting procedures describing LITT, our clinical advisors believe that these procedures would be more appropriately designated as Non-extensive procedures because they are more consistent with other procedures on the Non-extensive procedure code list.

Therefore, we are proposing to reassign the listed procedure codes describing LITT of various body parts from MS–DRGs 981, 982, and 983 (Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) for FY 2022.

As also discussed in section II.D.4.b. of the preamble of this proposed rule, we identified five procedure codes describing repair of the esophagus that are currently designated as extensive O.R. procedures. The procedure codes are 0DQ50ZZ (Repair esophagus, open approach), 0DQ53ZZ (Repair esophagus, percutaneous approach), 0DQ54ZZ (Repair esophagus, percutaneous endoscopic approach), 0DQ57ZZ (Repair esophagus, via natural or artificial opening), and 0DQ58ZZ (Repair esophagus, via natural or artificial opening endoscopic). Whenever one of these five procedure codes is reported on a claim that is unrelated to the MDC to which the case was assigned based on the principal diagnosis, it currently results in assignment to MS–DRGs 981, 982, and 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, without CC/MCC, respectively). Our clinical advisors stated that three of these five procedures warrant redesignation from the extensive procedure list and MS–DRGs 981, 982, and 983 to the non-extensive procedure list and to MS–DRGs 987, 988, and 989 (Non-Extensive Procedure Unrelated to Principal Diagnosis with MCC, with CC, without CC/MCC, respectively). Specifically, our clinical advisors stated the procedures identified by procedure codes 0DQ53ZZ, 0DQ57ZZ, and 0DQ58ZZ do not involve the same utilization of resources with respect to the performance of the procedure in comparison to the procedures identified by procedure codes 0DQ50ZZ and 0DQ540ZZ. In our analysis of claims from the March 2020 update of the FY 2019 MedPAR file, we identified three cases reporting procedure code 0DQ58ZZ in MS–DRGs 981, 982, and 983 with an average length of stay of 14 days and average costs of $34,894. In our analysis of claims from the September 2020 update of the FY 2020 MedPAR file, we identified two cases reporting procedure code 0DQ58ZZ in MS–DRGs 981, 982, or 983 with an average length of stay of 8 days and average costs of $12,037. Our clinical advisors believe that these procedures would be more appropriately designated as Non-extensive procedures because they are more consistent with other procedures on the Non-extensive procedure code list. Therefore, we are proposing to reassign these three procedure codes (0DQ53ZZ, 0DQ57ZZ, and 0DQ58ZZ) from MS–DRGs 981, 982, and 983 (Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) for FY 2022.

As discussed in section II.D.11.c.24. of the preamble of this proposed rule, we identified procedure code 0T9D0ZZ (Drainage of urethra, open approach) during our review of procedure code 0U9L0ZZ (Drainage of vestibular gland, open approach), which is currently designated as a non-O.R. procedure. We noted that the procedure described by procedure code 0T9D0ZZ represents the male equivalent of the female procedure described by procedure code 0U9L0ZZ. Procedure code 0T9D0ZZ is currently designated as an extensive O.R. procedure and is reported to describe procedures performed on the Cowper's (bulbourethral) gland in males. Whenever this procedure code is reported on a claim that is unrelated to the MDC to which the case was assigned based on the principal diagnosis, it currently results in assignment to MS–DRGs 981, 982, and 983 (Extensive O.R. Procedure Unrelated to Principal

Diagnosis with MCC, with CC, without CC/MCC, respectively).

Our clinical advisors stated that this procedure warrants redesignation from the extensive procedure list and MS–DRGs 981, 982, and 983 to the non-extensive procedure list and to MS–DRGs 987, 988, and 989 (Non-Extensive Procedure Unrelated to Principal Diagnosis with MCC, with CC, without CC/MCC, respectively). Specifically, our clinical advisors stated that the procedure described by procedure code 0T9D0ZZ continues to warrant an O.R. designation because it is performed on deeper structures and requires a higher level of technical skill and it is a more complex procedure when compared to the non-O.R. procedure described by procedure code 0U9L0ZZ, however, abscess formation in the Cowper's (bulbourethral) glands is uncommon and can often be treated with ultrasound guided percutaneous aspiration. The need for open surgical management is rare and includes chronic infection unresponsive to non-operative management and complicated acute infection such as perineal fistula formation. Open surgical management would require use of the operating room for both appropriate anesthesia and for the resources required to perform the more invasive perineal surgical dissection. Therefore, our clinical advisors believe a non-extensive O.R. designation is suitable for this procedure.

We analyzed claims data from the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file for cases reporting procedure code 0T9D0ZZ in MS–DRGs 981, 982, and 983. We found one case in MS–DRG 981 with an average length of stay of 8.0 days and average costs of $23,566 in the March 2020 update of the FY 2019 MedPAR file, and no cases in the September 2020 update of the FY 2020 MedPAR file. Although our claims analysis identified only one case reporting procedure code 0T9D0ZZ, our clinical advisors believe that these procedures would be more appropriately designated as Non-extensive procedures because they are more consistent with other procedures on the Non-extensive procedure code list.

Therefore, we are proposing to reassign procedure code 0T9D0ZZ from MS–DRGs 981, 982, and 983 (Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 987, 988, and 989 (Non-extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) for FY 2022.

11. Operating Room (O.R.) and Non-O.R. Issues

a. Background

Under the IPPS MS–DRGs (and former CMS MS–DRGs), we have a list of procedure codes that are considered operating room (O.R.) procedures. Historically, we developed this list using physician panels that classified each procedure code based on the procedure and its effect on consumption of hospital resources. For example, generally the presence of a surgical procedure which required the use of the operating room would be expected to have a significant effect on the type of hospital resources (for example, operating room, recovery room, and anesthesia) used by a patient, and therefore, these patients were considered surgical. Because the claims data generally available do not precisely indicate whether a patient was taken to the operating room, surgical patients were identified based on the procedures that were performed. Generally, if the procedure was not expected to require the use of the operating room, the patient would be considered medical (non-O.R.).

Currently, each ICD–10–PCS procedure code has designations that determine whether and in what way the presence of that procedure on a claim impacts the MS–DRG assignment. First, each ICD–10–PCS procedure code is either designated as an O.R. procedure for purposes of MS–DRG assignment (''O.R. procedures'') or is not designated as an O.R. procedure for purposes of MS–DRG assignment (''non-O.R. procedures''). Second, for each procedure that is designated as an O.R. procedure, that O.R. procedure is further classified as either extensive or non-extensive. Third, for each procedure that is designated as a non-O.R. procedure, that non-O.R. procedure is further classified as either affecting the MS–DRG assignment or not affecting the MS–DRG assignment. We refer to these designations that do affect MS–DRG assignment as ''non O.R. affecting the MS–DRG.'' For new procedure codes that have been finalized through the ICD–10 Coordination and Maintenance Committee meeting process and are proposed to be classified as O.R. procedures or non-O.R. procedures affecting the MS–DRG, our clinical advisors recommend the MS–DRG assignment which is then made available in association with the proposed rule (Table 6B.—New Procedure Codes) and subject to public comment. These proposed assignments are generally based on the assignment of predecessor codes or the assignment of similar codes. For example, we generally examine the MS–DRG assignment for similar procedures, such as the other approaches for that procedure, to determine the most appropriate MS–DRG assignment for procedures proposed to be newly designated as O.R. procedures. As discussed in section II.D.13 of the preamble of this proposed rule, we are making Table 6B.—New Procedure Codes—FY 2022 available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. We also refer readers to the ICD–10 MS–DRG Version 38.1 Definitions Manual at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software.html* for detailed information regarding the designation of procedures as O.R. or non-O.R. (affecting the MS–DRG) in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index.

In the FY 2020 IPPS/LTCH PPS proposed rule, we stated that, given the long period of time that has elapsed since the original O.R. (extensive and non-extensive) and non-O.R. designations were established, the incremental changes that have occurred to these O.R. and non-O.R. procedure code lists, and changes in the way inpatient care is delivered, we plan to conduct a comprehensive, systematic review of the ICD–10–PCS procedure codes. This will be a multi year project during which we will also review the process for determining when a procedure is considered an operating room procedure. For example, we may restructure the current O.R. and non O.R. designations for procedures by leveraging the detail that is now available in the ICD–10 claims data. We refer readers to the discussion regarding the designation of procedure codes in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38066) where we stated that the determination of when a procedure code should be designated as an O.R. procedure has become a much more complex task. This is, in part, due to the number of various approaches available in the ICD–10–PCS classification, as well as changes in medical practice. While we have typically evaluated procedures on the basis of whether or not they would be performed in an operating room, we believe that there may be other factors to consider with regard to resource utilization,

particularly with the implementation of ICD–10.

We discussed in the FY 2020 IPPS/LTCH PPS proposed rule that as a result of this planned review and potential restructuring, procedures that are currently designated as O.R. procedures may no longer warrant that designation, and conversely, procedures that are currently designated as non-O.R. procedures may warrant an O.R. type of designation. We intend to consider the resources used and how a procedure should affect the MS–DRG assignment. We may also consider the effect of specific surgical approaches to evaluate whether to subdivide specific MS DRGs based on a specific surgical approach. We plan to utilize our available MedPAR claims data as a basis for this review and the input of our clinical advisors. As part of this comprehensive review of the procedure codes, we also intend to evaluate the MS–DRG assignment of the procedures and the current surgical hierarchy because both of these factor into the process of refining the ICD–10 MS–DRGs to better recognize complexity of service and resource utilization.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58540 through 58541), we provided a summary of the comments we had received in response to our request for feedback on what factors or criteria to consider in determining whether a procedure is designated as an O.R. procedure in the ICD–10–PCS classification system for future consideration.

In consideration of the PHE, we believe it may be appropriate to allow additional time for the claims data to stabilize prior to selecting the timeframe to analyze for this review. Additional time is also necessary as we continue to develop our process and methodology. Therefore, we will provide more detail on this analysis and the methodology for conducting this review in future rulemaking.

In this proposed rule, we are addressing requests that we received regarding changing the designation of specific ICD–10–PCS procedure codes from non-O.R. to O.R. procedures, or changing the designation from O.R. procedure to non-O.R. procedure. In this section of the rule we discuss the process that was utilized for evaluating the requests that were received for FY 2022 consideration. For each procedure, our clinical advisors considered—

- Whether the procedure would typically require the resources of an operating room;
- Whether it is an extensive or a nonextensive procedure; and
- To which MS–DRGs the procedure should be assigned.

We note that many MS–DRGs require the presence of any O.R. procedure. As a result, cases with a principal diagnosis associated with a particular MS–DRG would, by default, be grouped to that MS–DRG. Therefore, we do not list these MS–DRGs in our discussion in this section of this rule. Instead, we only discuss MS–DRGs that require explicitly adding the relevant procedure codes to the GROUPER logic in order for those procedure codes to affect the MS–DRG assignment as intended. In cases where we are proposing to change the designation of procedure codes from non-O.R. procedures to O.R. procedures, we also are proposing one or more MS–DRGs with which these procedures are clinically aligned and to which the procedure code would be assigned.

In addition, cases that contain O.R. procedures will map to MS–DRG 981, 982, or 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) or MS–DRG 987, 988, or 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) when they do not contain a principal diagnosis that corresponds to one of the MDCs to which that procedure is assigned. These procedures need not be assigned to MS–DRGs 981 through 989 in order for this to occur. Therefore, if requestors included some or all of MS–DRGs 981 through 989 in their request or included MS–DRGs that require the presence of any O.R. procedure, we did not specifically address that aspect in summarizing their request or our response to the request in this section of this rule.

For procedures that would not typically require the resources of an operating room, our clinical advisors determined if the procedure should affect the MS–DRG assignment.

We received several requests to change the designation of specific ICD–10–PCS procedure codes from non-O.R. procedures to O.R. procedures, or to change the designation from O.R. procedures to non-O.R. procedures. In this section of this rule, we detail and respond to some of those requests. With regard to the remaining requests, our clinical advisors believe it is appropriate to consider these requests as part of our comprehensive review of the procedure codes as previously discussed.

b. O.R. Procedures to Non-O.R. Procedures

(1) Open Drainage of Subcutaneous Tissue and Fascia

One requestor identified the following ICD–10–PCS procedure code that describes the open drainage of right lower leg subcutaneous tissue and fascia, shown in the following table.

ICD-10-PCS Code	Code Description
0J9N0ZZ	Drainage of right lower leg subcutaneous tissue and fascia, open approach

In the ICD–10 MS–DRG Version 38.1 Definitions Manual, this ICD–10–PCS procedure code is currently recognized as an O.R. procedure for purposes of MS–DRG assignment. The requestor noted that this procedure consumes resources comparable to related ICD–10–PCS procedure code 0J9N00Z (Drainage of right lower leg subcutaneous tissue and fascia with drainage device, open approach) that describes the open drainage of right lower leg subcutaneous tissue and fascia with a drainage device, which is currently designated as a Non-O.R. procedure. The requestor stated that these comparable procedures should be recognized similarly for purposes of MS–DRG assignment.

During our review of this issue, we identified 21 ICD–10–PCS procedure codes that describe the open drainage of subcutaneous tissue and fascia, shown in the following table that are clinically similar to ICD–10–PCS code 0J9N0ZZ, and are also designated as O.R.

procedures in the ICD–10 MS–DRG Version 38.1 Definitions Manual.

ICD-10-PCS Code	Code Description
0J900ZZ	Drainage of scalp subcutaneous tissue and fascia, open approach
0J910ZZ	Drainage of face subcutaneous tissue and fascia, open approach
0J940ZZ	Drainage of right neck subcutaneous tissue and fascia, open approach
0J950ZZ	Drainage of left neck subcutaneous tissue and fascia, open approach
0J960ZZ	Drainage of chest subcutaneous tissue and fascia, open approach
0J970ZZ	Drainage of back subcutaneous tissue and fascia, open approach
0J980ZZ	Drainage of abdomen subcutaneous tissue and fascia, open approach
0J990ZZ	Drainage of buttock subcutaneous tissue and fascia, open approach
0J9B0ZZ	Drainage of perineum subcutaneous tissue and fascia, open approach
0J9C0ZZ	Drainage of pelvic region subcutaneous tissue and fascia, open approach
0J9D0ZZ	Drainage of right upper arm subcutaneous tissue and fascia, open approach
0J9F0ZZ	Drainage of left upper arm subcutaneous tissue and fascia, open approach
0J9G0ZZ	Drainage of right lower arm subcutaneous tissue and fascia, open approach
0J9H0ZZ	Drainage of left lower arm subcutaneous tissue and fascia, open approach
0J9J0ZZ	Drainage of right hand subcutaneous tissue and fascia, open approach
0J9K0ZZ	Drainage of left hand subcutaneous tissue and fascia, open approach
0J9L0ZZ	Drainage of right upper leg subcutaneous tissue and fascia, open approach
0J9M0ZZ	Drainage of left upper leg subcutaneous tissue and fascia, open approach
0J9P0ZZ	Drainage of left lower leg subcutaneous tissue and fascia, open approach
0J9Q0ZZ	Drainage of right foot subcutaneous tissue and fascia, open approach
0J9R0ZZ	Drainage of left foot subcutaneous tissue and fascia, open approach

We reviewed these procedures and our clinical advisors agree that procedures that describe the open drainage of subcutaneous tissue and fascia consume resources comparable to the related ICD–10–PCS procedure codes that describe the open drainage of subcutaneous tissue and fascia with a drainage device that are currently designated as non-O.R. procedures. These procedures do not typically require the resources of an operating room, and are not surgical in nature. Therefore, we are proposing to remove the 22 codes listed in the following table from the FY 2022 ICD–10 MS–DRGs Version 39 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index as O.R. procedures. Under this proposal, these procedures would no longer impact MS–DRG assignment.

ICD-10-PCS Code	Code Description
0J900ZZ	Drainage of scalp subcutaneous tissue and fascia, open approach
0J910ZZ	Drainage of face subcutaneous tissue and fascia, open approach
0J940ZZ	Drainage of right neck subcutaneous tissue and fascia, open approach
0J950ZZ	Drainage of left neck subcutaneous tissue and fascia, open approach
0J960ZZ	Drainage of chest subcutaneous tissue and fascia, open approach
0J970ZZ	Drainage of back subcutaneous tissue and fascia, open approach
0J980ZZ	Drainage of abdomen subcutaneous tissue and fascia, open approach
0J990ZZ	Drainage of buttock subcutaneous tissue and fascia, open approach
0J9B0ZZ	Drainage of perineum subcutaneous tissue and fascia, open approach
0J9C0ZZ	Drainage of pelvic region subcutaneous tissue and fascia, open approach
0J9D0ZZ	Drainage of right upper arm subcutaneous tissue and fascia, open approach
0J9F0ZZ	Drainage of left upper arm subcutaneous tissue and fascia, open approach
0J9G0ZZ	Drainage of right lower arm subcutaneous tissue and fascia, open approach
0J9H0ZZ	Drainage of left lower arm subcutaneous tissue and fascia, open approach
0J9J0ZZ	Drainage of right hand subcutaneous tissue and fascia, open approach
0J9K0ZZ	Drainage of left hand subcutaneous tissue and fascia, open approach
0J9L0ZZ	Drainage of right upper leg subcutaneous tissue and fascia, open approach
0J9M0ZZ	Drainage of left upper leg subcutaneous tissue and fascia, open approach
0J9N0ZZ	Drainage of right lower leg subcutaneous tissue and fascia, open approach

ICD-10-PCS Code	Code Description
0J9P0ZZ	Drainage of left lower leg subcutaneous tissue and fascia, open approach
0J9Q0ZZ	Drainage of right foot subcutaneous tissue and fascia, open approach
0J9R0ZZ	Drainage of left foot subcutaneous tissue and fascia, open approach

c. Non-O.R. Procedures to O.R. Procedures

(1) Percutaneous Introduction of Substance Into Cranial Cavity and Brain

One requestor identified ICD–10–PCS procedure code XW0Q316 (Introduction of eladocagene exuparvovec into cranial cavity and brain, percutaneous approach, new technology group 6) that the requestor stated is currently not recognized as an O.R. procedure for purposes of MS–DRG assignment. The requestor recommended that this procedure be designated as an O.R. procedure because the procedure requires traversing the skull in order to place a substance within the cranial cavity or brain. The requestor noted that CMS disagreed with designating this procedure as an O.R. procedure last year in the absence of claims data; however, the requestor stated that because the skull must be opened by drilling or cutting a burr hole through the skull, this procedure warrants O.R. status similar to other transcranial procedures performed with an open or percutaneous approach that are classified as O.R. procedures.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure code XW0Q316 is currently designated as a non-O.R. procedure for purposes of MS–DRG assignment. We agree with the requestor that procedure code XW0Q316 describes a procedure that involves the creation of a burr hole in the skull. In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58579 through 58580), we stated that, consistent with our annual process of assigning new procedure codes to MDCs and MS–DRGs, and designating a procedure as an O.R. or non-O.R. procedure, we reviewed the predecessor procedure code assignment. The predecessor code for procedure code XW0Q316 is procedure code 3E0Q3GC (Introduction of other therapeutic substance into cranial cavity and brain, percutaneous approach) which is designated as a non-O.R. procedure. In the absence of claims data, our clinical advisors also considered the indication for the specific procedure being described by the new procedure code, the treatment difficulty, and the resources utilized.

Upon further review and consideration, our clinical advisors agree that procedure code XW0Q316 describing a procedure that is performed by creating a burr hole in the skull warrants designation as an O.R. procedure consistent with other percutaneous procedures performed on the cranial cavity and brain body parts. Therefore, we are proposing to add this procedure code to the FY 2022 ICD–10 MS–DRGs Version 39 Definitions Manual in Appendix E- Operating Room Procedures and Procedure Code/MS–DRG Index as an O.R. procedure, assigned to MS–DRGs 628, 629, and 630 (Other Endocrine, Nutritional and Metabolic O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 10 (Endocrine, Nutritional and Metabolic Diseases and Disorders) and to MS–DRGs 987, 988, and 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC and without MCC/CC, respectively).

(2) Open Drainage of Maxilla and Mandible

One requestor identified three ICD–10–PCS procedure codes that describe the open drainage of maxilla or mandible that the requestor stated are currently not recognized as O.R. procedures for purposes of MS–DRG assignment. The three procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
0N9R0ZZ	Drainage of maxilla, open approach
0N9T0ZZ	Drainage of right mandible, open approach
0N9V0ZZ	Drainage of left mandible, open approach

The requestor stated that procedures that describe the open drainage of the maxilla or mandible should be designated as O.R. procedures because these procedures, indicated for diagnoses such as subperiosteal abscesses, are performed in the operating room under general anesthesia and involve making open incisions through muscle and stripping away the periosteum. The requestor identified procedure codes 0W950ZZ (Drainage of lower jaw, open approach) and 0W940ZZ (Drainage of upper jaw, open approach) that are currently designated as O.R. procedures. The requestor noted that ICD–10–PCS guidelines instruct that the procedure codes in Anatomical Regions, General, can be used when the procedure is performed on an anatomical region rather than a specific body part, or on the rare occasion when no information is available to support assignment of a code to a specific body part. The requestor stated that because bone is a specific body part in ICD–10–PCS, procedure codes should be assigned for subperiosteal drainage of mandible and maxilla bones from table 0N9, Drainage of Head and Facial Bones, instead of codes from table 0W9, Drainage of Anatomical Regions, General, when these procedures are performed. Therefore, the requestor stated that procedure codes 0N9R0ZZ, 0N9T0ZZ, and 0N9V0ZZ should also be recognized as O.R. procedures for purposes of MS–DRG assignment.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure codes 0N9R0ZZ, 0N9T0ZZ, and 0N9V0ZZ are currently designated as non-O.R. procedures for purposes of MS–DRG assignment. Our clinical advisors reviewed this issue and disagree that the procedures describing the open drainage of the maxilla or mandible are typically performed in the operating room under general anesthesia. Our clinical advisors state that these procedures can be done in an oral surgeon's office or an outpatient setting and are rarely performed in the inpatient setting. Our clinical advisors also state a correlation cannot be made between procedures performed in general anatomic regions and procedures performed in specific body parts because these procedures coded with the general anatomic regions body part represent a broader range of procedures that cannot be coded to a specific body part. Therefore, we are proposing to maintain the current non-O.R. designation of ICD–10–PCS procedure codes 0N9R0ZZ, 0N9T0ZZ, and 0N9V0ZZ.

(3) Thoracoscopic Extirpation of Pleural Cavities

One requestor identified ICD–10–PCS procedure codes 0WC94ZZ (Extirpation of matter from right pleural cavity, percutaneous endoscopic approach) and 0WCB4ZZ (Extirpation of matter from left pleural cavity, percutaneous

endoscopic approach) that the requestor stated are currently not recognized as O.R. procedures for purposes of MS–DRG assignment. The requestor stated that these procedures should be designated as O.R. procedures because they are thoracoscopic procedures that are always performed in the operating room under general anesthesia. The requestor stated procedure codes 0W994ZZ (Drainage of right pleural cavity, percutaneous endoscopic approach) and 0W9B4ZZ (Drainage of left pleural cavity, percutaneous endoscopic approach) are currently designated as O.R. procedures, therefore procedure codes 0WC94ZZ and 0WCB4ZZ should also be recognized as O.R. procedures for purposes of MS–DRG assignment because they utilize the same resources.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure codes 0WC94ZZ and 0WCB4ZZ are currently designated as non-O.R. procedures for purposes of MS–DRG assignment. Our clinical advisors reviewed this issue and disagree that procedure codes describing the thoracoscopic drainage of the pleural cavities should necessarily have the same designation as procedure codes describing the thoracoscopic extirpation of matter from the pleural cavities. We note that our review of the designation of ICD–10–PCS codes as an O.R. procedure or a non-O.R. procedure considers the resources used as well as whether that procedure should affect the MS–DRG assignment, and if so, in what way. Our clinical advisors state that thoracoscopic drainage of the pleural cavities is performed for distinct indications in clinically different scenarios. Our clinical advisors state that drainage is the process of taking out, or letting out, fluids and/or gases from a body part and is typically performed in the pleural cavity for indications such as congestive heart failure, infection, hemothorax and empyema. In contrast, the procedures describing the thoracoscopic extirpation of the pleural cavities are performed for a wider range of indications because the solid matter removed may be an abnormal byproduct of a biological function or a foreign body. Our clinical advisors note that the thoracoscopic extirpation of the pleural cavities is generally performed with other procedures such as heart transplant, lung transplant mechanical ventilation, and other major chest procedures and would not be the main reason for inpatient hospitalization or be considered the principal driver of resource expenditure.

Therefore, we are proposing to maintain the current non-O.R. designation of ICD–10–PCS procedure codes 0WC94ZZ and 0WCB4ZZ.

(4) Open Pleural Biopsy

One requestor identified ICD–10–PCS procedure codes 0BBN0ZX (Excision of right pleura, open approach, diagnostic) and 0BBP0ZX (Excision of left pleura, open approach, diagnostic), that describe an open pleural biopsy that the requestor stated are performed in the operating room with general anesthesia. The requestor also stated that procedure codes 0BBN0ZZ (Excision of right pleura, open approach) and 0BBP0ZZ (Excision of left pleura, open approach) describing open pleural biopsy for non-diagnostic purposes are justifiably designated as O.R. procedures. According to the requestor, these procedure codes describing an open pleural biopsy should be designated as O.R. procedures regardless of whether they are performed for diagnostic or therapeutic purposes.

We note that under the ICD–10–PCS procedure classification, biopsy procedures are identified by the 7th digit qualifier value ''diagnostic'' in the code description. In response to the requestor's suggestion that procedures performed for a pleural biopsy by an open approach, regardless of whether it is a diagnostic or therapeutic procedure, should be designated as an O.R. procedure, we examined procedure codes 0BBN0ZX, 0BBN0ZZ, 0BBP0ZX, and 0BBP0ZZ.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure codes 0BBN0ZZ and 0BBP0ZZ are currently designated as O.R. procedures, however, procedure codes 0BBN0ZX and 0BBP0ZX are not recognized as O.R. procedures for purposes of MS–DRG assignment. We agree with the requestor that procedure codes 0BBN0ZX and 0BBP0ZX would typically require the resources of an operating room. Our clinical advisors also agree that procedure codes 0BBN0ZX and 0BBP0ZX would typically require the resources of an operating room. Therefore, we are proposing to add these 2 procedure codes to the FY 2022 ICD–10 MS–DRGs Version 39 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS– DRG Index as O.R. procedures, assigned to MS–DRGs 166, 167, and 168 (Other Respiratory System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 04 (Diseases and Disorders of the Respiratory System).

(5) Percutaneous Revision of Intraluminal Devices

One requestor identified five ICD–10–PCS procedure codes that describe the percutaneous revision of intraluminal vascular devices that the requestor stated are currently not recognized as O.R. procedures for purposes of MS–DRG assignment. The five procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
02WY3DZ	Revision of intraluminal device in the great vessel, percutaneous approach
03WY3DZ	Revision of intraluminal device in upper artery, percutaneous approach
04WY3DZ	Revision of intraluminal device in lower artery, percutaneous approach
05WY3DZ	Revision of intraluminal device in upper vein, percutaneous approach
06WY3DZ	Revision of intraluminal device in lower vein, percutaneous approach

The requestor stated that the procedure codes that describe the percutaneous revision of intraluminal vascular devices within arteries, veins, and great vessels should be designated as O.R. procedures to compensate for the resources needed to perform these procedures. The requestor also stated procedures to reattach, realign, or otherwise revise intraluminal devices percutaneously require anesthesia, specialized equipment for intravascular visualization, significant skill, and time, therefore, it is important for these codes

to be designated with O.R. procedure status.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure codes 02WY3DZ, 03WY3DZ, 04WY3DZ, 05WY3DZ, and 06WY3DZ are currently designated as non-O.R. procedures for purposes of MS–DRG assignment. We agree with the requestor that these five ICD–10–PCS procedure codes typically require the resources of an operating room. Therefore, to the FY 2022 ICD–10 MS–DRG Version 39 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index, we are proposing to add code 02WY3DZ as an O.R. procedure assigned to MS–DRGs 270, 271, and 272 (Other Major Cardiovascular Procedures, with MCC, with CC, and without CC/MCC, respectively) in MDC 05 (Diseases and Disorders of the Circulatory System). We are also proposing to add codes 03WY3DZ, 04WY3DZ, 05WY3DZ, and 06WY3DZ as O.R. procedures assigned to MS–DRGs 252, 253, and 254 (Other Vascular Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 05 (Diseases and Disorders of the Circulatory System).

(6) Occlusion of Left Atrial Appendage

One requestor identified nine ICD–10–PCS procedure codes that describe left atrial appendage closure (LAAC) procedures that the requestor stated are currently not recognized as O.R. procedures for purposes of MS–DRG assignment in all instances. The nine procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
02L70CK	Occlusion of left atrial appendage with extraluminal device, open approach
02L70DK	Occlusion of left atrial appendage with intraluminal device, open approach
02L70ZK	Occlusion of left atrial appendage, open approach
02L73CK	Occlusion of left atrial appendage with extraluminal device, percutaneous approach
02L73DK	Occlusion of left atrial appendage with intraluminal device, percutaneous approach
02L73ZK	Occlusion of left atrial appendage, percutaneous approach
02L74CK	Occlusion of left atrial appendage with extraluminal device, percutaneous endoscopic approach
02L74DK	Occlusion of left atrial appendage with intraluminal device, percutaneous endoscopic approach
02L74ZK	Occlusion of left atrial appendage, percutaneous endoscopic approach

The requestor stated that these procedures are currently designated as non-O.R. procedures that route to surgical MS–DRGs only when assigned in combination with a principal diagnosis within MDC 05 (Diseases and Disorders of the Circulatory System). The requestor stated these procedures should also be designated as O.R. procedures when assigned in combination with diagnoses outside of the circulatory system, such as sepsis or trauma, to compensate for the associated resource use, skill requirements, and device costs.

In the ICD–10 MS–DRG Version 38.1 Definitions Manual, the nine ICD–10–PCS procedure codes that describe left atrial appendage closure are currently recognized as non-O.R. procedures that affect the MS–DRG to which they are assigned. We refer readers to section II.D.5.d of the preamble of this proposed rule, where we address ICD–10–PCS procedure codes 02L70CK, 02L70DK, and 02L70ZK that describe a LAAC procedure performed with an open approach. These codes were discussed in response to a request to reassign these codes to MS–DRGs 228 and 229 (Other Cardiothoracic Procedures with and without MCC, respectively) and, for the reasons discussed, we are proposing to maintain the assignment in MS–DRGs 273 and 274 (Percutaneous and Other Intracardiac Procedures with and without MCC, respectively) in MDC 05.

Our clinical advisors reviewed this related issue and believe the current designation of LAAC procedures as non-O.R. procedures that affect the assignment for MS–DRGs 273 and 274 is clinically appropriate to account for the subset of patients undergoing left atrial appendage closure specifically. LAAC is indicated and approved as a treatment option for patients diagnosed with atrial fibrillation, a heart rhythm disorder that can lead to cardiovascular blood clot formation, who are also at increased risk for stroke. LAAC procedures block off the left atrial appendage to prevent emboli that may form in the left atrial appendage from exiting and traveling to other sites in the vascular system, thereby preventing the occurrence of ischemic stroke and systemic thromboembolism. The ICD–10–CM diagnosis codes used to report atrial fibrillation are currently assigned to MDC 05 (Diseases and Disorders of the Circulatory System). Our clinical advisors believe that circumstances in which a patient is admitted for a principal diagnosis outside of MDC 05 and a left atrial appendage closure is performed as the only surgical procedure in the same admission are infrequent, and if they do occur, the LAAC procedure would not be a significant contributing factor in the increased intensity of resources needed for facilities to manage these complex cases. Our clinical advisors state LAAC procedures generally do not require the resources of an operating room. LAAC procedures are most often performed percutaneously in settings such as cardiac catheterization laboratories and take approximately one hour. When performed with an open approach or percutaneous endoscopic approach, these procedures share similar factors such as complexity, and resource

utilization with all other LAAC procedures. Therefore, we are proposing to maintain the current designation of ICD–10–PCS procedure codes 02L70CK, 02L70DK, 02L70ZK, 02L73CK, 02L73DK, 02L73ZK, 02L74CK, 02L74DK, and 02L74ZK as non-O.R. procedures affecting the MS–DRGs to which they are assigned.

(7) Arthroscopic Drainage of Joints

One requestor identified six ICD–10–PCS procedure codes that describe the percutaneous endoscopic drainage of joints that the requestor stated are currently not recognized as O.R. procedures for purposes of MS–DRG assignment. The six procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
0S9C4ZZ	Drainage of right knee joint, percutaneous endoscopic approach
0S9D4ZZ	Drainage of left knee joint, percutaneous endoscopic approach
0S994ZZ	Drainage of right hip joint, percutaneous endoscopic approach
0S9B4ZZ	Drainage of left hip joint, percutaneous endoscopic approach
0R9J4ZZ	Drainage of right shoulder joint, percutaneous endoscopic approach
0R9K4ZZ	Drainage of left shoulder joint, percutaneous endoscopic approach

The requestor stated that these procedures should be designated as O.R. procedures because procedures describing the arthroscopic drainage of major joints such as knee, hip, and shoulder are performed in the operating room under general anesthesia. The requestor stated these procedures are indicated for conditions such as symptomatic septic/pyogenic arthritis, which can require inpatient admission for intravenous antibiotics and arthroscopic drainage to resolve infection. Therefore, the requestor stated it is reasonable for these arthroscopic procedures to be designated as O.R. procedures to compensate for operating room resources.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure codes 0S9C4ZZ, 0S9D4ZZ, 0S994ZZ, 0S9B4ZZ, 0R9J4ZZ, and 0R9K4ZZ are currently designated as non-O.R. procedures for purposes of MS–DRG assignment. Our clinical advisors reviewed this issue and disagree that procedures describing the percutaneous endoscopic drainage of major joints such as knee, hip, and shoulder are typically performed in the operating room under general anesthesia. With development of better instrumentation and surgical techniques, many patients now have arthroscopic procedures performed in an outpatient setting and return home several hours after the procedure. Our clinical advisors also state the percutaneous endoscopic drainage of joints can be performed using local or regional anesthesia, and general anesthesia is not always required. In cases where the patient is admitted for diagnoses such as septic/pyogenic arthritis, as identified by the requestor, the requirement for intravenous antibiotics would be the main reason for admission because the percutaneous endoscopic drainage procedure could be done as an outpatient. Therefore, we are proposing to maintain the current non-O.R. designation of ICD–10–PCS procedure codes 0S9C4ZZ, 0S9D4ZZ, 0S994ZZ, 0S9B4ZZ, 0R9J4ZZ, and 0R9K4ZZ.

(8) Arthroscopic Irrigation of Joints

One requestor identified ICD–10–PCS procedure codes 3E1U48X (Irrigation of joints using irrigating substance, percutaneous endoscopic approach, diagnostic) and 3E1U48Z (Irrigation of joints using irrigating substance, percutaneous endoscopic approach) that the requestor stated are currently not recognized as O.R. procedures for purposes of MS–DRG assignment. The requestor stated that these procedures should be designated as O.R. procedures because the arthroscopic irrigation of joints such as knee, hip, and shoulder is performed in the operating room under general anesthesia. The requestor states procedure codes 3E1U48X and 3E1U48Z are used to describe surgical joint irrigations in the absence of more definitive procedures, therefore procedure codes 3E1U48X and 3E1U48Z should be recognized as O.R. procedures for purposes of MS–DRG assignment.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure codes 3E1U48X and 3E1U48Z are currently designated as non-O.R. procedures for purposes of MS–DRG assignment. Our clinical advisors reviewed this issue and disagree that procedure codes describing the arthroscopic irrigation of joints should be designated as O.R. procedures. Our clinical advisors note the arthroscopic irrigation of joints is rarely performed independently as a standalone procedure in the inpatient setting to be considered the principal driver of resource expenditure in those admissions. Instead, the arthroscopic irrigation of joints is generally performed with other definitive procedures such as debridement or synovectomy. We note that in the operative note sent by the requestor to support the requested change in O.R. status, the arthroscopic irrigation of the joint was performed along with a surgical debridement procedure. Therefore, we are proposing to maintain the current non-O.R. designation of ICD–10–PCS procedure codes 3E1U48X and 3E1U48Z.

(9) Percutaneous Reposition With Internal Fixation

One requestor identified four ICD–10–PCS procedure codes describing procedures performed on the sacroiliac and hip joints that involve percutaneous repositioning with internal fixation that the requestor stated are not recognized as O.R. procedures for purposes of MS–DRG assignment but warrant an O.R. designation. The procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
0SS734Z	Reposition right sacroiliac joint with internal fixation device, percutaneous approach
0SS834Z	Reposition left sacroiliac joint with internal fixation device, percutaneous approach
0SS934Z	Reposition right hip joint with internal fixation device, percutaneous approach
0SSB34Z	Reposition left hip joint with internal fixation device, percutaneous approach

Our clinical advisors reviewed the procedures described by these four procedure codes and agree that these percutaneous reposition procedures involving internal fixation in the sacroiliac and hip joint warrant an O.R. designation. They noted that these procedures are major operations that would require the resources of an operating room, involve a higher level of technical complexity and a greater utilization of hospital resources.

Therefore, we are proposing to add the two procedure codes describing percutaneous reposition of the sacroiliac joint with internal fixation procedures (0SS734Z and 0SS834Z) to the FY 2022 ICD–10 MS–DRGs Version 39 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index as O.R. procedures, assigned to MS–DRGs 515, 516, and 517 (Other Musculoskeletal System and Connective Tissue O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue) and to MS–DRGs 987, 988, and 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC and without MCC/CC, respectively). We are also proposing to add the two procedure codes describing percutaneous reposition of the hip joint with internal fixation procedures (0SS934Z and 0SSB34Z) to the FY 2022 ICD–10 MS–DRGs Version 39 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index as O.R. procedures, assigned to MS–DRGs 480, 481, and 482 (Hip and Femur Procedures Except Major Joint with MCC, with CC, and without CC/MCC, respectively) in MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue) and to MS–DRGs 987, 988, and 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC and without MCC/CC, respectively).

(10) Open Insertion and Removal of Spacer Into Shoulder Joint

One requestor identified four ICD–10–PCS procedure codes describing procedures performed on the shoulder joint that involve the insertion or removal of a spacer by an open approach that the requestor stated are not recognized as O.R. procedures for purposes of MS–DRG assignment. The procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
0RHK08Z	Insertion of spacer into left shoulder joint, open approach
0RHJ08Z	Insertion of spacer into right shoulder joint, open approach
0RPK08Z	Removal of spacer from left shoulder joint, open approach
0RPJ08Z	Removal of spacer from right shoulder joint, open approach

According to the requestor, insertion and removal of joint spacers from the hips and knees are designated with an O.R. procedure status and although similar procedures performed on the shoulder joint may be performed less frequently, these procedures warrant an O.R. designation because they are performed in the operating room under general anesthesia. During our review, we noted that the following procedure codes describing procedures performed on the shoulder joint that involve the insertion or removal of a spacer by a percutaneous endoscopic approach are also not recognized as O.R. procedures for purposes of MS–DRG assignment.

ICD-10-PCS Code	Code Description
0RPJ48Z	Removal of spacer from right shoulder joint, percutaneous endoscopic approach
0RPK48Z	Removal of spacer from left shoulder joint, percutaneous endoscopic approach
0RHJ48Z	Insertion of spacer into right shoulder joint, percutaneous endoscopic approach
0RHK48Z	Insertion of spacer into left shoulder joint, percutaneous endoscopic approach

Our clinical advisors reviewed the procedures described by these eight procedure codes and agree that these procedures involving the insertion or removal of a spacer in the shoulder joint with an open or percutaneous endoscopic approach warrant an O.R. designation. They noted that the insertion of a spacer is typically performed to treat an infection at the site of a previously placed prosthesis and the removal of a spacer is typically performed once the infection is healed and the site is ready for a new prosthetic replacement or to exchange for a new spacer if the infection is not yet healed.

Therefore, we are proposing to add the listed procedure codes describing the insertion or removal of spacer in the shoulder joint to the FY 2022 ICD–10 MS–DRGs Version 39 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index as O.R. procedures, assigned to MS–DRGs 510, 511, and 512 (Shoulder, Elbow or Forearm Procedures, Except Major Joint Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue) and to MS–DRGs 987, 988, and 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC and without MCC/CC, respectively).

(11) Open/Percutaneous Extirpation of Jaw

One requestor identified four ICD–10–PCS procedure codes that describe the extirpation of matter from the upper or lower jaw that the requestor stated are currently not recognized as O.R. procedures for purposes of MS–DRG assignment. The four procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
0WC40ZZ	Extirpation of matter from upper jaw, open approach
0WC44ZZ	Extirpation of matter from upper jaw, percutaneous endoscopic approach
0WC50ZZ	Extirpation of matter from lower jaw, open approach
0WC54ZZ	Extirpation of matter from lower jaw, percutaneous endoscopic approach

The requestor stated that the procedure codes that describe the extirpation of matter from the upper or lower jaw by an open or percutaneous endoscopic approach should be designated as O.R. procedures. The requestor stated these procedures would commonly be performed under general anesthesia and require the resources of an operating room. The requestor also stated that these ICD–10–PCS codes were specifically created to describe the surgical evacuation of solid matter from deep jaw structures therefore, it is important for these codes to be designated with O.R. procedure status.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure codes 0WC40ZZ, 0WC44ZZ, 0WC50ZZ, 0WC54ZZ are currently designated as non-O.R. procedures for purposes of MS–DRG assignment. We agree with the requestor that these four ICD–10–PCS procedure codes typically require the resources of an operating room. Therefore, to the FY 2022 ICD–10 MS–DRG Version 39 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index, we are proposing to add codes 0WC40ZZ, 0WC44ZZ, 0WC50ZZ, 0WC54ZZ as O.R. procedures assigned to MS–DRGs 143, 144 and 145 (Other Ear, Nose, Mouth and Throat O.R. procedures, with MCC, with CC, and without CC/MCC, respectively) in MDC 03 (Diseases and Disorders of the Ear, Nose, Mouth and Throat).

(12) Open Extirpation of Subcutaneous Tissue and Fascia

One requestor identified 22 ICD–10–PCS procedure codes that describe the open extirpation of matter from the subcutaneous tissue and fascia that the requestor stated are currently not recognized as O.R. procedures for purposes of MS–DRG assignment. The 22 procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
0JC00ZZ	Extirpation of matter from scalp subcutaneous tissue and fascia, open approach
0JC10ZZ	Extirpation of matter from face subcutaneous tissue and fascia, open approach
0JC40ZZ	Extirpation of matter from right neck subcutaneous tissue and fascia, open approach
0JC50ZZ	Extirpation of matter from left neck subcutaneous tissue and fascia, open approach
0JC60ZZ	Extirpation of matter from chest subcutaneous tissue and fascia, open approach
0JC70ZZ	Extirpation of matter from back subcutaneous tissue and fascia, open approach
0JC80ZZ	Extirpation of matter from abdomen subcutaneous tissue and fascia, open approach
0JC90ZZ	Extirpation of matter from buttocks subcutaneous tissue and fascia, open approach
0JCB0ZZ	Extirpation of matter from perineum subcutaneous tissue and fascia, open approach
0JCC0ZZ	Extirpation of matter from pelvic region subcutaneous tissue and fascia, open approach
0JCD0ZZ	Extirpation of matter from right upper arm subcutaneous tissue and fascia, open approach
0JCF0ZZ	Extirpation of matter from left upper arm subcutaneous tissue and fascia, open approach
0JCG0ZZ	Extirpation of matter from right lower arm subcutaneous tissue and fascia, open approach
0JCH0ZZ	Extirpation of matter from left lower arm subcutaneous tissue and fascia, open approach
0JCJ0ZZ	Extirpation of matter from right hand subcutaneous tissue and fascia, open approach
0JCK0ZZ	Extirpation of matter from left hand subcutaneous tissue and fascia, open approach
0JCL0ZZ	Extirpation of matter from right upper leg subcutaneous tissue and fascia, open approach
0JCM0ZZ	Extirpation of matter from left upper leg subcutaneous tissue and fascia, open approach
0JCN0ZZ	Extirpation of matter from right lower leg subcutaneous tissue and fascia, open approach
0JCP0ZZ	Extirpation of matter from left lower leg subcutaneous tissue and fascia, open approach
0JCQ0ZZ	Extirpation of matter from right foot subcutaneous tissue and fascia, open approach
0JCR0ZZ	Extirpation of matter from left foot subcutaneous tissue and fascia, open approach

The requestor stated that procedure codes that describe the open extirpation of matter from the subcutaneous tissue and fascia should be designated as O.R. procedures because these procedures are performed through open incisions with direct visualization of subcutaneous tissue and fascia in the operating room under general anesthesia. The requestor noted procedure codes that describe the open drainage of subcutaneous tissue and fascia and use comparable resources are currently designated as O.R. procedures. The requestor noted that root operation ''Drainage'' is assigned when fluid is drained; and root operation of ''Extirpation'' is assigned when any of the substance evacuated is solid. The requestor stated whether the evacuated substance is fluid, gelatinous, or solid, a procedure involving an open incision with direct visualization of subcutaneous tissue and fascia for evacuation of substances should be classified as an O.R. procedure. Therefore, the requestor stated that these procedures should also be recognized as O.R. procedures for purposes of MS–DRG assignment.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, the 22 ICD–10–PCS procedure codes listed in the table are currently designated as non-O.R. procedures for purposes of MS–DRG assignment. While we disagree that drainage procedures are comparable to extirpation procedures, we agree with the requestor that these 22 ICD–10–PCS procedure codes typically require the resources of an operating room. Our clinical advisors state that drainage is the process of taking out, or letting out, fluids and/or gases from a body part and is typically performed for indications such as abscess, infection, and other systemic conditions. In contrast, extirpation procedures are performed for a wider range of indications because the solid matter removed may be an abnormal byproduct of a biological function or a retained foreign body. Therefore, to the FY 2022 ICD–10 MS–DRG Version 39 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index, we are proposing to add the 22 ICD–10–PCS listed previously as O.R. procedures assigned to MS–DRGs 579, 580 and 581 (Other Skin, Subcutaneous Tissue and Breast Procedures, with MCC, with CC, and without CC/MCC, respectively) in MDC 09 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast) and MS–DRGs 907, 908, and 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively) in MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs).

(13) Open Revision and Removal of Devices From Subcutaneous Tissue and Fascia

One requestor identified six ICD–10–PCS procedure codes describing open revision and removal of neurostimulator generators, monitoring devices, and totally implantable vascular access devices (TIVADs) procedures that are not currently designated as O.R. procedures for purposes of MS–DRG assignment. The six procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
0JPT0MZ	Removal of stimulator generator from trunk subcutaneous tissue and fascia, open approach
0JPT02Z	Removal of monitoring device from trunk subcutaneous tissue and fascia, open approach
0JPT0WZ	Removal of totally implantable vascular access device from trunk subcutaneous tissue and fascia, open approach
0JWT0MZ	Revision of stimulator generator from trunk subcutaneous tissue and fascia, open approach
0JWT0WZ	Revision of totally implantable vascular access device from trunk subcutaneous tissue and fascia, open approach
0JWT03Z	Revision of infusion device in trunk subcutaneous tissue and fascia, open approach

The requestor stated that although removal of these devices is often performed in outpatient surgery, device complications can require removal or revision during inpatient hospitalizations. The requestor indicated it is reasonable for these open procedures to be designated as O.R. procedures to compensate for operating room resources during such inpatient stays.

Our clinical advisors reviewed this request and do not agree that these procedures warrant an O.R. designation. They noted that these procedures are generally performed in the outpatient setting and when performed during a hospitalization, it is typically in conjunction with another O.R. procedure. Therefore, we are proposing to maintain the current non-O.R. designation for procedure codes 0JPT0MZ, 0JPT02Z, 0JPT0WZ, 0JWT0MZ, 0JWT0WZ, and 0JWT03Z for FY 2022.

(14) Open Insertion of Feeding Device

One requestor identified ICD–10–PCS procedure code 0DHA0UZ (Insertion of feeding device into jejunum, open approach) that the requestor stated is currently not recognized as an O.R. procedure for purposes of MS–DRG assignment. The requestor stated the open insertion of a feeding device into the jejunum should be designated as an O.R. procedure because this procedure is performed in the operating room under general anesthesia. The requestor noted comparable procedure code 0DH60UZ (Insertion of feeding device into stomach, open approach) is currently designated as an O.R. procedure. Therefore, the requestor stated that procedure code 0DHA0UZ should also be recognized as an O.R. procedure for purposes of MS–DRG assignment.

Our analysis of this issue confirmed that in the ICD–10 MS–DRG Version 38.1 Definitions Manual, for purposes of MS–DRG assignment, 0DHA0UZ is recognized as a non-O.R. procedure and 0DH60UZ is currently recognized as an O.R. procedure. In reviewing this request, we also identified the following four related codes:

ICD-10-PCS Code	Code Description
0DH50UZ	Insertion of feeding device into esophagus, open approach
0DH80UZ	Insertion of feeding device into small intestine, open approach
0DH90UZ	Insertion of feeding device into duodenum, open approach
0DHB0UZ	Insertion of feeding device into ileum, open approach

In the ICD–10 MS–DRGs Version 38.1, these four ICD–10–PCS codes are currently recognized as non-O.R. procedure for purposes of MS–DRG assignment. While we agree with the requestor that procedures describing the open insertion of a feeding device into the jejunum are comparable to procedures describing the open insertion of a feeding device into the stomach, we do not agree that these procedures should be designated as O.R. procedures. Our clinical advisors state the procedures that describe the open insertion of a feeding device into the jejunum or the stomach should instead have the same designation as the related ICD–10–PCS procedure codes that describe the open insertion of a feeding device into the esophagus, small intestine, duodenum and ileum that are currently designated as non-O.R. procedures.

With advancements in procedural techniques, feeding devices are most commonly placed using a percutaneous endoscopic approach. Our clinical advisors state feeding devices are usually not placed using an open surgical approach; this approach is

generally only used if the patient requires another surgical procedure at the same time. When placed at the same time as another surgical procedure, our clinical advisors state the surgical procedure, as the main determinant of resource use for those cases, should drive the MS–DRG assignment, not the procedure that describes the open insertion of a feeding device. For these reasons, our clinical advisors state procedures that describe the open insertion of a feeding device in the gastrointestinal system should all have the same non-O.R. designation in the ICD–10 MS–DRGs Version 39 for coherence.

Therefore, we are proposing to maintain the current non-O.R. designation of ICD–10–PCS procedure code 0DHA0UZ. We are also proposing to remove ICD–10–PCS procedure code 0DH60UZ from the FY 2022 ICD–10 MS–DRG Version 39 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index as an O.R. procedure. Under this proposal, this procedure would no longer impact MS–DRG assignment.

(15) Laparoscopic Insertion of Feeding Tube

One requestor identified ICD–10–PCS procedure codes 0DH64UZ (Insertion of feeding device into stomach, percutaneous endoscopic approach) and 0DHA4UZ (Insertion of feeding device into jejunum, percutaneous endoscopic approach) that the requestor stated are currently not recognized as O.R. procedures for purposes of MS–DRG assignment. The requestor stated the procedures describing the percutaneous endoscopic insertion of a feeding device into the stomach or the jejunum should be designated as O.R. procedures because these procedures are performed in the operating room under general anesthesia. The requestor stated all laparoscopic procedures, regardless if they are diagnostic or therapeutic, should be classified as O.R. procedures to compensate for operating room resources.

Our analysis of this issue confirmed that in the ICD–10 MS–DRG Version 38.1 Definitions Manual, 0DH64UZ and 0DHA4UZ are currently designated as non-O.R. procedures for purposes of MS–DRG assignment. In reviewing this request, we also identified the following four related codes:

ICD-10-PCS Code	Code Description
0DH54UZ	Insertion of feeding device into esophagus, percutaneous endoscopic approach
0DH84UZ	Insertion of feeding device into small intestine, percutaneous endoscopic approach
0DH94UZ	Insertion of feeding device into duodenum, percutaneous endoscopic approach
0DHB4UZ	Insertion of feeding device into ileum, percutaneous endoscopic approach

In the ICD–10 MS–DRGs Version 38.1, these four ICD–10–PCS codes are currently recognized as non-O.R. procedures for purposes of MS–DRG assignment. Our clinical advisors reviewed this request and do not agree that unilaterally all laparoscopic procedures should be designated as O.R. procedures. While the procedural approach is an important consideration in the designation of a procedure, there are other clinical factors such as the site of procedure, the procedure complexity, and resource utilization that should also be considered. In this regard, our clinical advisors indicated that codes 0DH64UZ and 0DHA4UZ describing the percutaneous endoscopic insertion of a feeding device into the stomach or the jejunum, do not require the resources of an operating room, are not surgical in nature, and are generally performed in the outpatient setting. The percutaneous endoscopic insertion of a feeding device also does not require general anesthesia. As opposed to being rendered unconscious, patients can receive a local anesthetic (usually a lidocaine spray), an intravenous (IV) pain reliever, and a mild sedative if needed. Patients receiving these devices usually return home the same day after placement, unless they are in the hospital for treatment of another condition.

Our clinical advisors state the percutaneous endoscopic insertion of a feeding device into the stomach or the jejunum is comparable to the related ICD–10–PCS procedure codes that describe the insertion of feeding devices of other gastrointestinal system body parts that are currently designated as non-O.R. procedures. Our clinical advisors believe all procedures that describe the percutaneous endoscopic insertion of a feeding device in the gastrointestinal system should continue to have the same non-O.R. designation in the ICD–10 MS–DRGs Version 39 for coherence. Therefore, for the reasons discussed, we are proposing to maintain the current non-O.R. designation of ICD–10–PCS procedure codes 0DH64UZ and 0DHA4UZ.

(16) Endoscopic Fragmentation and Extirpation of Matter of Urinary Tract

One requestor sent two separate but related requests related to endoscopic procedures performed in the urinary system. With regard to the first request, the requestor identified six ICD–10–PCS procedure codes that describe endoscopic fragmentation in the kidney pelvis, ureter, bladder, and bladder neck that the requestor stated are currently not recognized as O.R. procedures for purposes of MS–DRG assignment. The six procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
0TF38ZZ	Fragmentation in right kidney pelvis, via natural or artificial opening, endoscopic
0TF48ZZ	Fragmentation in left kidney pelvis, via natural or artificial opening, endoscopic
0TF68ZZ	Fragmentation in right ureter, via natural or artificial opening, endoscopic
0TF78ZZ	Fragmentation in left ureter, via natural or artificial opening, endoscopic
0TFB8ZZ	Fragmentation in bladder, via natural or artificial opening, endoscopic
0TFC8ZZ	Fragmentation in bladder neck, via natural or artificial opening, endoscopic

The requestor stated that these procedures should be designated as O.R. procedures because procedures such as the endoscopic fragmentation of calculi within the kidney pelvis, ureter, bladder, and bladder neck are performed in the operating room under anesthesia. The requestor stated that procedures that describe the endoscopic extirpation of calculi from the kidney pelvis or ureter use comparable resources, and are designated as O.R. procedures. Therefore, the requestor asserted it is reasonable that procedure codes that describe endoscopic fragmentation in kidney pelvis, ureter, bladder, and bladder neck also be designated as O.R. procedures.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure codes 0TF38ZZ, 0TF48ZZ, 0TF68ZZ, 0TF78ZZ, 0TFB8ZZ, and 0TFC8ZZ are designated as non-O.R. procedures for purposes of MS–DRG assignment. Our clinical advisors reviewed this issue and disagree that procedures describing the endoscopic fragmentation of calculi within the kidney pelvis, ureter, bladder, and bladder neck are typically performed in the operating room. In endoscopic fragmentation procedures in the kidney pelvis, ureter, bladder, and bladder neck, the scope is passed through a natural or artificial orifice. The procedure is not surgical in nature and involves no skin incisions. With advancements in scope size, deflection capabilities, video imaging, and instrumentation, many patients now have these endoscopic urinary procedures performed in an outpatient setting, instead of the inpatient setting. Therefore, we are proposing to maintain the current non-O.R. designation of ICD–10–PCS procedure codes 0TF38ZZ, 0TF48ZZ, 0TF68ZZ, 0TF78ZZ, 0TFB8ZZ, and 0TFC8ZZ.

In the second request, the requestor also identified two ICD–10–PCS procedure codes that describe endoscopic extirpation of matter from the bladder and bladder neck that the requestor stated are also currently not recognized as O.R. procedures for purposes of MS–DRG assignment. The two procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
0TCB8ZZ	Extirpation of matter from bladder via natural or artificial opening, endoscopic
0TCC8ZZ	Extirpation of matter from bladder neck via natural or artificial opening, endoscopic

The requestor stated that these procedures also should be designated as O.R. procedures because they performed in the operating room under anesthesia.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure codes 0TCB8ZZ and 0TCC8ZZ are currently designated as a non-O.R. procedure for purposes of MS–DRG assignment. To review the request to designate 0TCB8ZZ and 0TCC8ZZ as O.R. procedures and in response to the requestor's suggestion that resource consumption is comparable in procedures describing endoscopic fragmentation in the urinary system and procedures describing the endoscopic extirpation in the urinary system, we examined the following procedure codes:

ICD-10-PCS Code	Code Description
0TC08ZZ	Extirpation of matter from right kidney, via natural or artificial opening endoscopic
0TC18ZZ	Extirpation of matter from left kidney, via natural or artificial opening endoscopic
0TC38ZZ	Extirpation of matter from right kidney pelvis, via natural or artificial opening endoscopic
0TC48ZZ	Extirpation of matter from left kidney pelvis, via natural or artificial opening endoscopic
0TC68ZZ	Extirpation of matter from right ureter, via natural or artificial opening endoscopic
0TC78ZZ	Extirpation of matter from left ureter, via natural or artificial opening endoscopic

In the ICD–10 MS–DRG Version 38.1 Definitions Manual, these six ICD–10–PCS procedure codes are currently recognized as O.R. procedures for purposes of MS–DRG assignment. Our clinical advisors indicated that these procedures are not surgical in nature. In endoscopic extirpation procedures, the scope enters the urinary tract through the urethra, which is the tube that carries urine out of the body, or through an artificial orifice. Our clinical advisors state the urinary system is one conduit so the scope continues to pass through the urethra, bladder, and into the ureter or kidney (if necessary) to access the stone. For that reason, the procedures describing endoscopic extirpation from a urinary body part should all have the same non-O.R. designation in the ICD–10 MS–DRGs Version 39 for coherence.

Therefore, we are proposing to maintain the current non-O.R. designation of ICD–10–PCS procedure codes 0TCB8ZZ and 0TCC8ZZ. We are also proposing to remove ICD–10–PCS procedure codes 0TC08ZZ, 0TC18ZZ, 0TC38ZZ, 0TC48ZZ, 0TC68ZZ, and 0TC78ZZ from the FY 2022 ICD–10 MS–DRG Version 39 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index as O.R. procedures. Under this proposal, these procedures would no longer impact MS–DRG assignment.

(17) Endoscopic Removal of Ureteral Stent

One requestor identified ICD–10–PCS procedure code 0TP98DZ (Removal of intraluminal device from ureter, via natural or artificial opening endoscopic) that the requestor stated is not recognized as an O.R. procedure for purposes of MS–DRG assignment. The requestor suggested that this procedure warrants an O.R. designation because the procedure code describes a procedure that is performed in the operating room with anesthesia. The requestor stated that while most ureteral stents can be removed by string, some complicated cases require endoscopic removal using forceps in the operating room under general anesthesia and may be performed during inpatient stays precipitated by severe urinary tract infection, sepsis, or urinary obstructions. The requestor asserted that procedure codes for insertion of ureteral stent(s) via a ureteroscopic, endoscopic approach have been justifiably designated as O.R. procedures because they are performed in the O.R. under anesthesia. Therefore, the requestor suggested it is reasonable for endoscopic removal of the stent to be designated with OR procedure status to compensate for operating room resources and anesthesia.

Our clinical advisors reviewed this procedure and do not agree that it warrants an O.R. designation. They noted that this procedure is generally not the focus of the admission when it is performed and does not reflect the technical complexity or resource intensity in comparison to other procedures that are designated as O.R. procedures. Therefore, we are proposing to maintain the current non-O.R. designation for procedure code 0TP98DZ for FY 2022.

(18) Endoscopic/Transorifice Inspection of Ureter

One requestor identified ICD–10–PCS procedure code 0TJ98ZZ (Inspection of ureter, via natural or artificial opening endoscopic), that describes procedures involving endoscopic viewing of the ureter that the requestor stated is currently not recognized as an O.R. procedure for purposes of MS–DRG assignment.

The requestor stated this ureteroscopy procedure is performed in the operating room with anesthesia. According to the requestor, the inspection of ureter procedure code is assigned when obstruction is found during the ureteroscopy and procedures to break up (fragmentation), remove calculi (extirpation), or place a ureteral stent cannot be performed.

Our clinical advisors reviewed this procedure and disagree that it warrants an O.R. designation. They noted that this procedure typically does not require hospitalization and is generally not the reason for the patient's admission since it is often performed in connection with another O.R. procedure when it is performed. Therefore, we are proposing to maintain the current non-O.R. designation for procedure code 0TJ789ZZ for FY 2022.

(19) Endoscopic Biopsy of Ureter and Kidney

One requestor identified six ICD–10–PCS procedure codes that describe endoscopic biopsy procedures performed on the ureter and kidney structures that the requestor stated are currently not recognized as O.R. procedures for purposes of MS–DRG assignment. According to the requestor, regardless of whether it is a diagnostic or therapeutic procedure, these procedures should be designated as O.R. procedures because the procedures utilize operating room, anesthesia and recovery room resources. The requestor stated that after the surgeon places the scope into the bladder that ureteral orifices must be identified and instruments carefully navigated to obtain excisional biopsies from within the ureter or further within the kidney.

The six procedure codes are listed in the following table.

ICD-10-PCS Code	Code Description
0TB08ZX	Excision of right kidney, via natural or artificial opening, endoscopic, diagnostic
0TB18ZX	Excision of left kidney, via natural or artificial opening, endoscopic, diagnostic
0TB38ZX	Excision of right kidney pelvis, via natural or artificial opening, endoscopic, diagnostic
0TB48ZX	Excision of left kidney pelvis, via natural or artificial opening, endoscopic, diagnostic
0TB68ZX	Excision of right ureter, via natural or artificial opening, endoscopic, diagnostic
0TB78ZX	Excision of left ureter, via natural or artificial opening, endoscopic, diagnostic

We note that under the ICD–10–PCS procedure classification, biopsy procedures are identified by the 7th digit qualifier value ''diagnostic'' in the code description.

Our clinical advisors do not agree that endoscopic biopsy procedures performed on the ureter and kidney structures warrant an O.R. designation. They stated these procedures are typically not the focus for the patient's admission and are frequently performed in conjunction with another O.R. procedure. Therefore, we are proposing to maintain the current non-O.R. designation for procedure codes 0TB08ZX, 0TB18ZX, 0TB38ZX, 0TB48ZX, 0TB68ZX, and 0TB78ZX for FY 2022.

(20) Transorifice Insertion of Ureteral Stent

One requestor identified three ICD–10–PCS procedure codes that the requestor stated are not recognized as O.R. procedures for purposes of MS–DRG assignment. The requestor suggested that the procedure described by these procedure codes warrants an O.R. designation because it involves the insertion of an indwelling ureteral stent through a nephrostomy with image-guidance in the interventional radiology suite. According to the requestor, image-guided technology now allows placement of ureteral stents through nephrostomy tracts. The requestor stated this procedure may or may not be performed in the operating room, however, it involves placement of device(s), interventional radiology resources, sedation, and continuous monitoring of vital signs. The three procedure codes are shown in the following table.

ICD-10-PCS Code	Code Description
0T767DZ	Dilation of right ureter with intraluminal device, via natural or artificial opening
0T777DZ	Dilation of left ureter with intraluminal device, via natural or artificial opening
0T787DZ	Dilation of bilateral ureters with intraluminal device, via natural or artificial opening

Our clinical advisors reviewed this request and do not agree that this procedure warrants an O.R. designation. They noted that this procedure is not surgical in nature, does not require the resources of an operating room and is not a technically complex procedure requiring increased hospital resources. Therefore, we are proposing to maintain the current non-O.R. designation for procedure codes 0T767DZ, 0T777DZ, and 0T787DZ for FY 2022.

(21) Percutaneous Insertion of Ureteral Stent

One requestor identified three ICD–10–PCS procedure codes that the requestor stated are not recognized as O.R. procedures for purposes of MS–DRG assignment. The requestor suggested that the procedure described by these procedure codes warrants an O.R. designation because the procedure is typically performed following a failed ureteral stent insertion procedure in the operating room, which can only be reported as a cystoscopy or ureteroscopy, neither of which are designated as O.R. procedures. According to the requestor, percutaneous ureteral stenting through the abdominal wall is subsequently performed in an interventional radiology suite with image-guidance, sedation, and continuous vital sign monitoring. The three procedure codes are shown in the following table.

ICD-10-PCS Code	Code Description
0T763DZ	Dilation of right ureter with intraluminal device, percutaneous approach
0T773DZ	Dilation of left ureter with intraluminal device, percutaneous approach
0T783DZ	Dilation of bilateral ureters with intraluminal device, percutaneous approach

Our clinical advisors reviewed this request and do not agree that the procedure warrants an O.R. designation. They noted that this procedure is not surgical in nature, does not involve technical complexity or require the resources of an operating rom. Therefore, we are proposing to maintain the current non-O.R. designation for procedure codes 0T763DZ, 0T773DZ, and 0T783DZ for FY 2022.

(22) Endoscopic Dilation of Urethra

One requestor identified ICD–10–PCS procedure code 0T7D8DZ (Dilation of urethra with intraluminal device, via natural or artificial opening endoscopic) that the requestor stated is not recognized as an O.R. procedure for purposes of MS–DRG assignment. The requestor suggested that this procedure warrants an O.R. designation because the procedure code describes a procedure that utilizes the UroLift® System, a minimally invasive technology to treat lower urinary tract symptoms (LUTS) due to benign prostatic hyperplasia (BPH). According to the requestor, the technology is placed endoscopically within the prostatic urethra in the operating room under anesthesia.

Our clinical advisors reviewed this request and do not agree that the procedure warrants an O.R. designation. They noted that this procedure is performed without incision, resection or thermal injury to the prostate and is primarily performed in the outpatient setting. It is generally not the cause for the patient's admission and utilization of resources when it is performed. Therefore, we are proposing to maintain the current non-O.R. designation for procedure code 00T7D8DZ for FY 2022.

(23) Open Repair of Scrotum

One requestor identified ICD–10–PCS procedure code 0VQ50ZZ (Repair scrotum, open approach) that the requestor stated is not recognized as an O.R. procedure for purposes of MS–DRG assignment. The requestor suggested that this procedure warrants an O.R. designation because it involves repair of scrotal tissue deeper than the skin with direct visualization and utilizes general anesthesia in the operating room.

Our clinical advisors do not agree that open repair of the scrotum merits an O.R. designation. They stated this procedure would not typically require the resources of an operating room and would generally not be a contributing factor impacting hospital resource use during the patient's admission when it is performed. Therefore, we are proposing to maintain the current non-O.R. designation for procedure code 0VQ50ZZ for FY 2022.

(24) Open Drainage of Vestibular Gland

One requestor identified ICD–10–PCS procedure code 0U9L0ZZ (Drainage of vestibular gland, open approach) that describes a procedure commonly performed for the treatment of an abscess that the requestor stated is performed in the operating room under general anesthesia and therefore warrants an O.R designation. The requestor stated this procedure is comparable to the procedure described by procedure code 0UBL0ZZ (Excision of vestibular gland, open approach) which is currently designated as an O.R. procedure.

During our review of procedure code 0U9L0ZZ, we also examined procedure codes 0U9L0ZX (Drainage of vestibular gland, open approach, diagnostic), 0U9LXZX (Drainage of vestibular gland, external approach, diagnostic), and 0UBL0ZZ. Separately, we reviewed procedure code 0T9D0ZZ (Drainage of urethra, open approach) because it represents the male equivalent of the female procedure described by procedure code 0U9L0ZZ.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure codes 0T9D0ZZ, 0U9L0ZX, 0U9LXZX, and 0UBL0ZZ are currently designated as O.R. procedures, however, procedure code 0U9L0ZZ is not recognized as an O.R. procedure for purposes of MS–DRG assignment. We examined procedure code 0U9L0ZZ and do not believe this drainage procedure warrants an O.R. designation, nor do we agree that this drainage of the vestibular gland procedure (0U9L0ZZ) is comparable to an excision of the vestibular gland procedure (0UBL0ZZ), which is currently designated as an O.R. procedure.

In the ICD–10–PCS classification, drainage is defined as taking or letting out fluids and/or gases from a body part and excision is defined as cutting out or off, without replacement, a portion of a body part. Therefore, the classification specifically defines and distinguishes the underlying objectives of each distinct procedure. Our clinical advisors stated a drainage procedure is frequently performed in the outpatient setting and is generally not the cause for the patient's admission and utilization of resources when it is performed. Drainage of the vestibular gland, also known as Bartholin's glands, is typically indicated when a cyst or abscess is present and may or may not involve the placement of a Word catheter. Conversely, excision of the vestibular gland is not considered an office-based procedure and is generally reserved for a vulvar mass or for patients who have not responded to more conservative attempts to create a drainage tract. In addition, after review, our clinical advisors recommended changing the O.R. status for procedure codes 0U9L0ZX and 0U9LXZX from O.R. to non-O.R. for similar reasons. These procedures do not typically require the resources of an operating room.

Therefore, we are proposing to remove procedure codes 0U9L0ZX and 0U9LXZX from the FY 2022 ICD–10 MS–DRGs Version 39 Definitions Manual in Appendix E- Operating Room Procedures and Procedure Code/MS–DRG Index as O.R. procedures. Under this proposal, these procedure codes would no longer impact MS–DRG assignment. We refer the reader to section II.D.10 of the preamble of this proposed rule for further discussion related to procedure code 0T9D0ZZ.

(25) Transvaginal Repair of Vagina

One requestor identified ICD–10–PCS procedure code 0UQG7ZZ (Repair vagina, via natural or artificial opening) that the requestor stated is currently not recognized as an O.R. procedure for purposes of MS–DRG assignment. The requestor stated that procedures described by this code such as the non-obstetric transvaginal repair of the vaginal cuff and the non-obstetric transvaginal repair of vaginal lacerations should be designated as O.R. procedures because these procedures are performed in the operating room under general anesthesia. The requestor noted procedure codes 0USG7ZZ (Reposition vagina, via natural or artificial opening), 0UBG7ZZ (Excision of vagina, via natural or artificial opening), and 0UQG8ZZ (Repair vagina, via natural or artificial opening endoscopic) are currently designated as O.R. procedures, therefore procedure code 0UQG7ZZ should also be recognized as an O.R. procedure for purposes of MS–DRG assignment.

In the ICD–10 MS–DRGs Definitions Manual Version 38.1, procedure code 0UQG7ZZ is currently designated as a non-O.R. procedure for purposes of MS–DRG assignment. Our clinical advisors reviewed this issue and disagree that a correlation can be made between procedures described as the transvaginal repair of the vagina and the procedures described by ICD–10–PCS codes 0USG7ZZ, 0UBG7ZZ, and 0UQG8ZZ. The root operation ''repair'' represents a broad range of procedures for restoring the anatomic structure of a body part such as suture of lacerations, while the root operations ''reposition,'' and ''excision'' define procedures with more

distinct objectives. Also the approach ''via natural or artificial opening'', for example, transvaginal, is defined as the entry of instrumentation through a natural or artificial external opening to reach the site of the procedure while the ''via natural or artificial opening endoscopic approach'' is defined as the entry of instrumentation (for example a scope) through a natural or artificial external opening to both reach and visualize the site of the procedure. Our clinical advisors also disagree that procedures described as the transvaginal repair of the vagina are typically performed in the operating room under general anesthesia. Our clinical advisors state transvaginal repair can be performed using regional anesthesia, used to numb only the area of the body that requires surgery instead of rendering the patient unconscious. Therefore, for the reasons described, we are proposing to maintain the current non-O.R. designation of ICD–10–PCS procedure code 0UQG7ZZ.

(26) Percutaneous Tunneled Vascular Access Devices

One requestor identified ten ICD–10–PCS procedure codes describing percutaneous insertion of tunneled vascular access devices into various body parts that the requestor stated are not recognized as an O.R. procedure for purposes of MS–DRG assignment. The requestor suggested that these procedures warrant an O.R. designation because they are placed in an interventional radiology suite or in the operating room under anesthesia. The ten procedure codes are shown in the following table.

ICD-10-PCS Code	Code Description
0JH63XZ	Insertion of tunneled vascular access device into chest subcutaneous tissue and fascia, percutaneous approach
0JH83XZ	Insertion of tunneled vascular access device into abdomen subcutaneous tissue and fascia, percutaneous approach
0JHD3XZ	Insertion of tunneled vascular access device into right upper arm subcutaneous tissue and fascia, percutaneous approach
0JHF3XZ	Insertion of tunneled vascular access device into left upper arm subcutaneous tissue and fascia, percutaneous approach
0JHG3XZ	Insertion of tunneled vascular access device into right lower arm subcutaneous tissue and fascia, percutaneous approach
0JHH3XZ	Insertion of tunneled vascular access device into left lower arm subcutaneous tissue and fascia, percutaneous approach
0JHL3XZ	Insertion of tunneled vascular access device into right upper leg subcutaneous tissue and fascia, percutaneous approach
0JHM3XZ	Insertion of tunneled vascular access device into left upper leg subcutaneous tissue and fascia, percutaneous approach
0JHN3XZ	Insertion of tunneled vascular access device into right lower leg subcutaneous tissue and fascia, percutaneous approach
0JHP3XZ	Insertion of tunneled vascular access device into left lower leg subcutaneous tissue and fascia, percutaneous approach

According to the requestor, it does not make sense for tunneled vascular access devices to group to procedural MS–DRGs in limited circumstances as is the case currently with the logic in MDC 9 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast) and MDC 11 (Diseases and Disorders of the Kidney and Urinary Tract). The requestor stated that these procedures should be grouping to procedural MS–DRGs across all MDCs.

We note that we have addressed requests related to these procedures in previous rulemaking (85 FR 58511 through 58517). Our clinical advisors reviewed this request and disagree that procedures performed to insert a tunneled vascular access device should group to procedural MS–DRGs across all MDCs. They stated that these percutaneous procedures are generally performed in the outpatient setting and when performed during a hospitalization, they are frequently performed in combination with another O.R. procedure. Therefore, we are proposing to maintain the current non-O.R. status for the ten procedure codes listed previously for FY 2022.

12. Proposed Changes to the MS–DRG Diagnosis Codes for FY 2022

a. Background of the CC List and the CC Exclusions List

Under the IPPS MS–DRG classification system, we have developed a standard list of diagnoses that are considered CCs. Historically, we developed this list using physician panels that classified each diagnosis code based on whether the diagnosis, when present as a secondary condition, would be considered a substantial complication or comorbidity. A substantial complication or comorbidity was defined as a condition that, because

of its presence with a specific principal diagnosis, would cause an increase in the length-of-stay by at least 1 day in at least 75 percent of the patients. However, depending on the principal diagnosis of the patient, some diagnoses on the basic list of complications and comorbidities may be excluded if they are closely related to the principal diagnosis. In FY 2008, we evaluated each diagnosis code to determine its impact on resource use and to determine the most appropriate CC subclassification (NonCC, CC, or MCC) assignment. We refer readers to sections II.D.2. and 3. of the preamble of the FY 2008 IPPS final rule with comment period for a discussion of the refinement of CCs in relation to the MS–DRGs we adopted for FY 2008 (72 FR 47152 through 47171).

b. Overview of Comprehensive CC/MCC Analysis

In the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159), we described our process for establishing three different levels of CC severity into which we would subdivide the diagnosis codes. The categorization of diagnoses as a MCC, a CC, or a NonCC was accomplished using an iterative approach in which each diagnosis was evaluated to determine the extent to which its presence as a secondary diagnosis resulted in increased hospital resource use. We refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159) for a complete discussion of our approach. Since the comprehensive analysis was completed for FY 2008, we have evaluated diagnosis codes individually when assigning severity levels to new codes and when receiving requests to change the severity level of specific diagnosis codes.

We noted in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19235 through 19246) that with the transition to ICD–10–CM and the significant changes that have occurred to diagnosis codes since the FY 2008 review, we believed it was necessary to conduct a comprehensive analysis once again. Based on this analysis, we proposed changes to the severity level designations for 1,492 ICD–10–CM diagnosis codes and invited public comments on those proposals. As summarized in the FY 2020 IPPS/LTCH PPS final rule, many commenters expressed concern with the proposed severity level designation changes overall and recommended that CMS conduct further analysis prior to finalizing any proposals. After careful consideration of the public comments we received, as discussed further in the FY 2020 final rule, we generally did not finalize our proposed changes to the severity designations for the ICD–10–CM diagnosis codes, other than the changes to the severity level designations for the diagnosis codes in category Z16- (Resistance to antimicrobial drugs) from a NonCC to a CC. We stated that postponing adoption of the proposed comprehensive changes in the severity level designations would allow further opportunity to provide additional background to the public on the methodology utilized and clinical rationale applied across diagnostic categories to assist the public in its review. We refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42150 through 42152) for a complete discussion of our response to public comments regarding the proposed severity level designation changes for FY 2020.

We discussed in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58550 through 58554) that we plan to continue a comprehensive CC/MCC analysis, using a combination of mathematical analysis of claims data as discussed in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19235) and the application of nine guiding principles and plan to present the findings and proposals in future rulemaking. The nine guiding principles are as follows:

- Represents end of life/near death or has reached an advanced stage associated with systemic physiologic decompensation and debility.
- Denotes organ system instability or failure.
- Involves a chronic illness with susceptibility to exacerbations or abrupt decline.
- Serves as a marker for advanced disease states across multiple different comorbid conditions.
- Reflects systemic impact.
- Post-operative/post-procedure condition/complication impacting recovery.
- Typically requires higher level of care (that is, intensive monitoring, greater number of caregivers, additional testing, intensive care unit care, extended length of stay).
- Impedes patient cooperation and/or management of care.
- Recent (last 10 years) change in best practice, or in practice guidelines and review of the extent to which these changes have led to concomitant changes in expected resource use.

We refer readers to the FY 2021 IPPS/LTCH PPS final rule for a complete discussion of our response to public comments regarding the nine guiding principles. We continue to solicit feedback regarding these guiding principles, as well as other possible ways we can incorporate meaningful indicators of clinical severity. When providing additional feedback or comments, we encourage the public to provide a detailed explanation of how applying a suggested concept or principle would ensure that the severity designation appropriately reflects resource use for any diagnosis code.

For new diagnosis codes approved for FY 2022, consistent with our annual process for designating a severity level (MCC, CC or NonCC) for new diagnosis codes, we first review the predecessor code designation, followed by review and consideration of other factors that may be relevant to the severity level designation, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the condition. We note that this process does not automatically result in the new diagnosis code having the same designation as the predecessor code. We refer the reader to II.D.13 of this proposed rule for the discussion of the proposed changes to the ICD–10–CM and ICD–10–PCS coding systems for FY 2022.

For this FY 2022 IPPS/LTCH PPS proposed rule, we received several requests to change the severity level designations of specific ICD–10–CM diagnosis codes. Our clinical advisors believe it is appropriate to consider these requests in connection with our continued comprehensive CC/MCC analysis in future rulemaking, rather than proposing to change the designation of individual ICD–10–CM diagnosis codes at this time. As stated earlier in this section, we plan to continue a comprehensive CC/MCC analysis, using a combination of mathematical analysis of claims data and the application of nine guiding principles. We will consider these individual requests received for changes to severity level designations as we continue our comprehensive CC/MCC analysis and will provide more detail in future rulemaking.

c. Potential Change to Severity Level Designation for Unspecified Diagnosis Codes for FY 2022

For this FY 2022 IPPS/LTCH PPS proposed rule, as another interval step as we continue to address the comprehensive review of the severity designations of ICD–10–CM diagnosis codes in which we have been engaged over the past two years, we are requesting public comments on a potential change to the severity level designations for ''unspecified'' ICD–10–CM diagnosis codes that we are considering adopting for FY 2022.

Specifically, we are considering changing the severity level designation of all ''unspecified'' diagnosis codes to a NonCC where there are other codes available in that code subcategory that further specify the anatomic site, effective for FY 2022, after consideration of the public comments we receive in response to this proposed rule.

According to the ICD–10–CM Official Guidelines for Coding and Reporting, codes titled ''unspecified'' are for use when the information in the medical record is insufficient to assign a more specific code. In our review of severity level designation of the codes in the ICD–10–CM classification, we noted 3,490 ''unspecified'' diagnosis codes designated as either CC or MCC, where there are other codes available in that code subcategory that further specify the anatomic site with an equivalent severity level designation. For example, ICD–10–CM code L89.003 (Pressure ulcer of unspecified elbow, stage 3) is currently designated as a MCC. In the same code subcategory of L89.0- (Pressure ulcer of elbow), ICD–10–CM codes L89.013 (Pressure ulcer of right elbow, stage 3) and code L89.023 (Pressure ulcer of left elbow, stage 3) are also designed as MCCs.

In the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159), we described the categorization of diagnoses as an MCC, a CC, or a NonCC, accomplished using an iterative approach in which each diagnosis was evaluated to determine the extent to which its presence as a secondary diagnosis resulted in increased hospital resource use. As such, the designation of CC or MCC is intended to account for the increased resources required to address a condition as a secondary diagnosis. The usage of ''unspecified'' diagnosis codes where there are other codes available in that code subcategory that further specify the anatomic site may contribute to and eventually result in less reliable data for researching clinical outcomes. If documentation is not available to code to the highest level of specificity as to the laterality of the condition treated, and an unspecified code is reported by the hospital, it may be harder to quantify in the claims data what additional resources were expended to address that condition in terms of requiring clinical evaluation, therapeutic treatment, diagnostic procedures, extended length of hospital stay, increased nursing care and/or monitoring.

As stated previously, we discussed in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58550 through 58554) that we plan to continue a comprehensive CC/MCC analysis, using a combination of mathematical analysis of claims data, and the application of nine guiding principles, and plan to present the findings and proposals in future rulemaking. As patients present with a variety of diagnoses, in examining the secondary diagnoses, we stated we would consider what additional resources are required, that surpasses those that are already being utilized to address the principal diagnosis and/or other secondary diagnoses that might also be present on the claim. The goal of our comprehensive analysis is to create stratification for reimbursing inpatient hospitalization in the fewest amount of categories with the most explanatory power in a clinically cohesive way. We believe more robust claims data would facilitate this effort to determine the impact on resource use and inform our decision-making in determining the most appropriate CC subclass (NonCC, CC, or MCC) assignment for each diagnosis as a secondary diagnosis. As part of this effort, we are soliciting comments on adopting a change to the severity level designation of the 3,490 ''unspecified'' diagnosis codes currently designated as either CC or MCC, where there are other codes available in that code subcategory that further specify the anatomic site, to a NonCC for FY 2022.

As discussed in the HIPAA Administrative Simplification: Modification to Medical Data Code Set Standards To Adopt ICD–10–CM and ICD–10–PCS proposed rule (73 FR 49796 through 49803), in proposing the adoption of ICD–10–CM and ICD–10–PCS, we listed that the addition of laterality in ICD–10–CM— specifying which organ or part of the body is involved when the location could be on the right, the left, or could be bilateral, was one of several improvements over ICD–9–CM. We also noted that in comparison to ICD–9–CM, ICD–10–CM diagnosis codes are very specific and that this specificity improves the richness of data for analysis and improves the accuracy of data used for medical research. In the Modifications to Medical Data Code Set Standards To Adopt ICD–10–CM and ICD–10–PCS final rule (74 FR 3328 through 3362), we adopted the ICD–10–CM and ICD–10–PCS as medical data code sets under HIPAA, replacing ICD–9–CM Volumes 1 and 2, and Volume 3 and noted that ICD–10–CM and ICD–10–PCS provide specific diagnosis and treatment information that can improve quality measurements and patient safety, and the evaluation of medical processes and outcomes. We continue to believe that reporting the most specific diagnosis codes supported by the available medical record documentation and clinical knowledge of the patient's health condition would more accurately reflect the health care encounter and improve the reliability and validity of the coded data.

We believe that changing the severity level for these ''unspecified codes'' as compared to the more specific codes in the same subcategory recognizing laterality would leverage the additional specificity available under the ICD–10 system, by fostering the reporting of the most specific diagnosis codes supported by the available medical record documentation and clinical knowledge of the patient's health condition to more accurately reflect each health care encounter and improve the reliability and validity of the coded data. However in consideration of the PHE, and to the extent that some providers may not currently have programs in place that focus on improving documentation, we are requesting public comments on making this change to the severity level designation for these unspecified ICD–10–CM diagnosis codes for FY 2022.

The diagnosis codes for which we are soliciting comments on a change in severity level designation as described in this proposed rule are shown in Table 6P.2a (which is available via the internet on the CMS website at: *http://www.cms.hhs.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). We note we are also making available the data describing the impact on resource use when reported as a secondary diagnosis for all 3,490 ICD–10–CM unspecified diagnosis codes. While these claims data were not used in our identification of the ''unspecified'' diagnosis codes for which there are other codes available in the code subcategory that further specify the anatomic site, as mentioned earlier in this section, these data are consistent with data historically used to mathematically measure impact on resource use for secondary diagnoses, and the data which we plan to use in combination with application of the nine guiding principles as we continue a comprehensive CC/MCC analysis. Therefore, we are displaying the data on these unspecified codes in order to facilitate public comment on these potential changes in the severity level designation for these codes.

In Table 6P.2a associated with this proposed rule, column C displays the FY 2020 severity level designation for these diagnosis codes in MS–DRG Grouper Version 37.2. Column D displays CMS' current FY 2021 severity level designation in MS–DRG Grouper

Version 38.1 and column E displays the potential changes to the severity level designation that we are considering adopting. Columns F–O show data on the impact on resource use generated using discharge claims from the September 2019 update of the FY 2019 MedPAR file and MS–DRG Grouper Version 37.2. Columns Q–Z show data on the impact on resource use generated using discharge claims from the September 2020 update of the FY 2020 MedPAR file and MS–DRG Grouper Version 38.1.

For further information on the data on the impact on resource use as displayed in Columns F–O and Columns Q–Z, we refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159) for a complete discussion of the methodology utilized to mathematically measure the impact on resource use. Also, as discussed in the FY 2021 IPPS/LTCH PPS proposed rule (85 FR 32550), to provide the public with more information on the CC/MCC comprehensive analysis discussed in the FY 2020 IPPS/LTCH PPS proposed and final rules, CMS hosted a listening session on October 8, 2019. The listening session included a review of this methodology utilized to mathematically measure the impact on resource use. We refer readers to *https://www.cms.gov/Outreach-and-Education/Outreach/OpenDoorForums/PodcastAndTranscripts.html* for the transcript and audio file of the listening session. We also refer readers to *https://www.cms.gov/Medicare/MedicareFee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software.html* for the supplementary file containing the data describing the impact on resource use of specific ICD–10–CM diagnosis codes when reported as a secondary diagnosis that was made available for the listening session.

This table shows the Version 38.1 ICD–10 MS–DRG categorization of diagnosis codes by severity level.

Current Categorization of CC Codes (Version 38.1)	
	Number of Codes
MCC	3,278
CC	14,679
NonCC	54,664
Total	72,621

We are requesting public comments on a modification to the Version 38.1 severity level subclass assignments for 4.8 percent of the ICD–10–CM diagnosis codes, potentially effective with the Version 39 ICD–10 MS–DRG MCC/CC list. The following table compares the Version 38.1 ICD–10 MS–DRG MCC/CC list and the potential Version 39 ICD–10 MS–DRG MCC/CC list. There are 17,957 diagnosis codes on the Version 38.1 MCC/CC lists. These potential MCC/CC severity level changes would reduce the number of diagnosis codes on the MCC/CC lists to 14,467 (2,771+ 11,696).

POTENTIAL MCC/CC SUBCLASS MODIFICATIONS						
Severity Level – CC Subclass	**Version 38.1 Severity Level Number of Codes**	**Potential Version 39 Severity Level Number of Codes**	**Percent Change**	**Potential Version 39 Change to MCC subclass, Number of Codes**	**Potential Version 39 Change to CC subclass, Number of Codes**	**Potential Version 39 Change to NonCC subclass, Number of Codes**
MCC	3,278	2,771	-15.5%	N/A	0	507
CC	14,679	11,696	-20.3	0	N/A	2,983
NonCC	54,664	58,154	6.4%	0	0	N/A
Total	**72,621**	**72,621**	**N/A**	**0**	**0**	**3,490**

The net result of these potential changes to the Version 39 ICD–10 MS–DRG MCC/CC list, for the 72,621 diagnosis codes in the ICD–10–CM classification, would be a decrease of 507 (3,278 − 2,771) codes designated as an MCC, a decrease of 2,983 (14,679 − 11,696) codes designated as a CC, and an increase of 3,490 (58,154 − 54,664) codes designated as a NonCC.

The following table compares the Version 38.1 ICD–10 MS–DRG severity level list and the potential Version 39 ICD–10 MS–DRG severity level list by each of the 22 chapters of the ICD–10–CM classification to display how each chapter of ICD–10–CM might be affected by these modifications.

BILLING CODE 4120–01–P

ICD-10-CM Chapter	Version 38.1 MCC+CC Subclass, Number of Codes	Potential Version 39 Change to NonCC subclass, Number of Codes	Potential Version 39 Severity Level Number of Codes	Percent Change
Certain infectious and parasitic diseases (A00-B99)	757	0	757	0%
Neoplasms (C00-D49)	782	31	751	-4.0%
Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism (D50-D89)	142	0	142	0%
Endocrine, nutritional and metabolic diseases (E00-E89)	246	0	246	0%
Mental, Behavioral and Neurodevelopmental disorders (F01-F99)	265	0	265	0%
Diseases of the nervous system (G00-G99)	250	6	244	-2.4%
Diseases of the eye and adnexa (H00-H59)	259	62	197	-23.9%
Diseases of the ear and mastoid process (H60-H95)	32	5	27	-15.6%
Diseases of the circulatory system (I00-I99)	709	58	651	-8.2%
Diseases of the respiratory system (J00-J99)	160	0	160	0%

Diseases of the digestive system (K00-K95)	397	0	397	0%
Diseases of the skin and subcutaneous tissue (L00-L99)	323	55	268	-17.0%
Diseases of the musculoskeletal system and connective tissue (M00-M99)	1,414	413	1,001	-29.2%
Diseases of the genitourinary system (N00-N99)	168	2	166	-1.2%
Pregnancy, childbirth and the puerperium (O00-O9A)	652	4	648	-0.6%
Certain conditions originating in the perinatal period (P00-P96)	163	0	163	0%
Congenital malformations, deformations and chromosomal abnormalities (Q00-Q99)	252	0	252	0%
Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00-R99)	74	0	74	0%
Injury, poisoning and certain other consequences of external causes (S00-T88)	10,867	2,854	8,013	-26.3%
External causes of morbidity (V00-Y99)	0	0	0	0%
Factors influencing health status and contact with health services (Z00-Z99)	44	0	44	0%
Codes for special purposes (U00-U85)	1	0	1	0%
Total	**17,957**	**3,490**	**14,467**	**-19.4%**

BILLING CODE 4120–01–C

As shown in the table, the Diseases of the Musculoskeletal System and Connective Tissue (M00–M99) chapter of ICD–10–CM would have the largest percentage reduction in codes designated as CC/MCC. Twelve chapters would have a zero percentage change to the percentage of codes designated as CC/MCC.

As stated previously, we are requesting public comments on our possible adoption of a change to the severity level designation of these 3,490 ''unspecified'' diagnosis codes currently designated as either CC or MCC, where there are other codes available in that code subcategory that further specify the anatomic site, to a NonCC, potentially effective with the Version 39 ICD–10 MS–DRG MCC/CC list. As part of this request, we would be interested in comments regarding whether this modification might present operational challenges and how we might otherwise foster the reporting of the most specific diagnosis codes supported by the available medical record documentation and clinical knowledge of the patient's health condition to more accurately

reflect each health care encounter and improve the reliability and validity of the coded data.

d. Proposed Additions and Deletions to the Diagnosis Code Severity Levels for FY 2022

The following tables identify the proposed additions and deletions to the diagnosis code MCC severity levels list and the proposed additions to the diagnosis code CC severity levels list for FY 2022 and are available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html.*

Table 6I.1—Proposed Additions to the MCC List—FY2022;

Table 6I.2— Proposed Deletions to the MCC List—FY2022; and

Table 6J.1— Proposed Additions to the CC List—FY2022.

e. Proposed CC Exclusions List for FY 2022

In the September 1, 1987 final notice (52 FR 33143) concerning changes to the DRG classification system, we modified the GROUPER logic so that certain diagnoses included on the standard list of CCs would not be considered valid CCs in combination with a particular principal diagnosis. We created the CC Exclusions List for the following reasons: (1) To preclude coding of CCs for closely related conditions; (2) to preclude duplicative or inconsistent coding from being treated as CCs; and (3) to ensure that cases are appropriately classified between the complicated and uncomplicated DRGs in a pair.

In the May 19, 1987 proposed notice (52 FR 18877) and the September 1, 1987 final notice (52 FR 33154), we explained that the excluded secondary diagnoses were established using the following five principles:

- Chronic and acute manifestations of the same condition should not be considered CCs for one another;
- Specific and nonspecific (that is, not otherwise specified (NOS)) diagnosis codes for the same condition should not be considered CCs for one another;
- Codes for the same condition that cannot coexist, such as partial/total, unilateral/bilateral, obstructed/unobstructed, and benign/malignant, should not be considered CCs for one another;
- Codes for the same condition in anatomically proximal sites should not be considered CCs for one another; and
- Closely related conditions should not be considered CCs for one another.

The creation of the CC Exclusions List was a major project involving hundreds of codes. We have continued to review the remaining CCs to identify additional exclusions and to remove diagnoses from the master list that have been shown not to meet the definition of a CC. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50541 through 50544) for detailed information regarding revisions that were made to the CC and CC Exclusion Lists under the ICD–9–CM MS–DRGs.

The ICD–10 MS–DRGs Version 38.1 CC Exclusion List is included as Appendix C in the ICD–10 MS–DRG Definitions Manual, which is available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*, and includes two lists identified as Part 1 and Part 2. Part 1 is the list of all diagnosis codes that are defined as a CC or MCC when reported as a secondary diagnosis. For all diagnosis codes on the list, a link is provided to a collection of diagnosis codes which, when reported as the principal diagnosis, would cause the CC or MCC diagnosis to be considered as a NonCC. Part 2 is the list of diagnosis codes designated as a MCC only for patients discharged alive; otherwise, they are assigned as a NonCC.

As discussed in section II.D.12.c. of the preamble of this proposed rule, we are requesting public comments on potential changes to the severity level for 3,490 diagnosis codes describing an ''unspecified'' anatomic site, from a CC severity level to a NonCC severity level, for FY 2022. We refer the reader to Table 6P.3a associated with this proposed rule (which is available via the internet on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html)* for the list of the 3,490 diagnosis codes that are currently listed in Part 1 of the CC Exclusions List and are defined as a CC when reported as a secondary diagnosis. Table 6P.3a is divided into several tabs, with the first tab titled ''SDX Codes and Exclu Categories'' containing columns A, B, and C. Column A (titled ''ICD–10–CM Code'') lists the ''unspecified'' diagnosis codes that are currently listed in Part 1 of Appendix C of the CC Exclusions List, column B (titled ''Description'') lists the narrative description of each diagnosis code, and column C (titled Exclusion Category) contains a hyperlink to the collection of diagnosis codes which, when reported as the principal diagnosis, would cause the CC diagnosis to be considered as a NonCC. For example, for line 2, Column A displays diagnosis code C34.00, column B displays ''Malignant neoplasm of unspecified main bronchus'' and column C displays a hyperlink to Exclusion Category number 280. When the user clicks on the hyperlink for number 280, they are directed to another tab labeled ''PDX Category 280'' that contains the list of diagnosis codes which, when reported as the principal diagnosis, would cause the corresponding CC diagnosis to be considered as a NonCC. In connection with the request for public comments on the potential changes to the severity level for 3,490 diagnosis codes describing an ''unspecified'' anatomic site, from a CC severity level to a NonCC severity level for FY 2022, Table 6P.3a is being made available for readers to review and consider the list of the 3,490 ''unspecified'' diagnosis codes that are currently included in Part 1 of the CC Exclusions List and the principal diagnosis exclusion category with which they are currently associated. If we were to finalize the potential changes to the severity level for the 3,490 diagnosis codes describing an ''unspecified'' anatomic site from a CC severity level to a NonCC severity level for FY 2022, we would also finalize the removal of these codes from the CC Exclusions List for FY 2022.

We received three requests related to the CC Exclusions List logic, as we discuss in this section of this proposed rule.

We received a request to review the secondary diagnoses that are excluded as a CC or MCC in the CC Exclusions List logic when any one of the following three diagnosis codes is reported as the principal diagnosis.

ICD-10-CM Code	Code Description
O99.891	Other specified diseases and conditions complicating pregnancy
O99.892	Other specified diseases and conditions complicating childbirth
O99.893	Other specified diseases and conditions complicating puerperium

According to the requestor, in the ICD–10 MS–DRGs version 37.2 CC Exclusions List logic, the predecessor code for the listed diagnosis codes, diagnosis code O99.89 (Other specified diseases and conditions complicating pregnancy, childbirth and the puerperium) is listed in the collection of principal diagnosis list number 1000, therefore, when a CC or MCC secondary diagnosis associated with that principal diagnosis list describes a condition as occurring in pregnancy, childbirth or the puerperium, the CC Exclusions List logic will render that diagnosis code as a NonCC. The requestor stated that because diagnosis code O99.89 under version 37.2 of the ICD–10 MS–DRGs is now a subcategory under version 38.1 of the ICD–10 MS–DRGs, with three unique diagnosis codes to specify which obstetric stage the patient is in, that further analysis of the new diagnosis codes (O99.891, O99.892, and O99.893) should occur to determine if changes to the collection of principal diagnosis list is warranted. The requestor provided three examples for CMS to review and consider for possible changes to the CC Exclusions List logic.

In the first example, the requestor noted that diagnosis code O72.1 (Other immediate postpartum hemorrhage) is listed as a CC secondary diagnosis associated with the collection of principal diagnosis list number 1000, and that under the ICD–10 MS–DRGs version 38.1 CC Exclusions List logic, the diagnosis listed in principal diagnosis collection 1000 is now diagnosis code O99.893 (Other specified diseases and conditions complicating puerperium). Thus, both diagnosis codes (O72.1 and O99.893) are describing conditions occurring specifically in the postpartum or puerperium period. The postpartum period is defined as the period beginning immediately after delivery and continues for six weeks following delivery. A postpartum complication is any complication occurring within the six-week period. The requestor stated that because diagnosis code O72.1 is assigned for documented postpartum uterine atony with hemorrhage when it occurs immediately following the delivery of the baby and placenta, that CMS should review diagnosis code O99.892 (Other specified diseases and conditions complicating childbirth) and determine if it should be added to the collection of principal diagnosis list number 1000 to cause diagnosis code O72.1 to be considered as a NonCC when diagnosis code O99.892 is reported as the principal diagnosis.

In the second example, the requestor noted that diagnosis code O98.32 (Other infections with a predominantly sexual mode of transmission complicating childbirth) is associated with principal diagnosis collection number 1012. The requestor also noted that principal diagnosis collection number 1012 does not list diagnosis codes O99.891, O99.892, or O99.893 as a principal diagnosis to exclude the CC secondary diagnosis code O98.32, however, it does list diagnosis codes O98.311 (Other infections with a predominantly sexual mode of transmission complicating pregnancy, first trimester), O98.312 (Other infections with a predominantly sexual mode of transmission complicating pregnancy, second trimester), and O98.313 (Other infections with a predominantly sexual mode of transmission complicating pregnancy, third trimester) as a principal diagnosis to exclude the CC secondary diagnosis code O98.32. The requestor recommended CMS review diagnosis codes O98.32 (Other infections with a predominantly sexual mode of transmission complicating childbirth) and O98.33 (Other infections with a predominantly sexual mode of transmission complicating the puerperium), to determine if diagnosis codes O99.891, O99.892 or O99.893, when reported as a principal diagnosis, should exclude CC secondary diagnosis codes O98.32 and O98.33. Thus, the requestor suggested CMS consider if it is appropriate to add diagnosis codes O99.891, O99.892 and O99.893 to principal diagnosis collection number 1012 to cause diagnosis code O98.32 to be considered as a NonCC when diagnosis codes O99.891, O99.892 or O99.893 are reported as the principal diagnosis.

In the third example, the requestor noted that diagnosis code O87.2 (Hemorrhoids in the puerperium) is associated with principal diagnosis collection number 4041. The requestor also noted that principal diagnosis collection number 4041 lists diagnosis code O99.893 as a principal diagnosis to exclude the CC diagnosis code O87.2, however, it does not list diagnosis code O99.892. The requestor further noted that the ''Includes'' note at Category O87 (Venous complications and hemorrhoids in the puerperium) in the FY 2021 ICD–10–CM Tabular List includes ''venous complications in labor, delivery and the puerperium'', therefore, diagnosis code O87.2 would also be reported for documented hemorrhoids during labor and delivery. The requestor recommended CMS review diagnosis code O99.892 to determine if, when reported as a principal diagnosis, it should exclude CC diagnosis code O87.2. Thus, the requestor suggested CMS consider if it is appropriate to add diagnosis code O99.892 to principal diagnosis collection number 4041 to cause diagnosis code O87.2 to be considered as a NonCC when diagnosis code O99.892 is reported as the principal diagnosis.

We reviewed diagnosis codes O99.891, O99.892 and O99.893 with respect to the principal diagnosis collection list and because these diagnosis codes are specifically describing ''other specified diseases and conditions complicating pregnancy, childbirth, and the puerperium,'' respectively, we do not believe that any of these three diagnosis codes, when reported as a principal diagnosis, should exclude any CC secondary diagnosis. In cases where any one of these three diagnosis codes is reported as a principal diagnosis, which are generally anticipated to be rare, it is understood that there is not a more specific diagnosis code available in the classification to report as the principal diagnosis that identifies the underlying or associated cause of the disease or the condition complicating the specific obstetric stage (pregnancy, childbirth, or puerperium), hence the ''other specified'' in the code title. Specifically, the title of category O99 is ''Other maternal diseases classifiable elsewhere but complicating pregnancy, childbirth and the puerperium'' and there are nine subcategories, each of which is generally associated with a single organ

system or etiology, with the exception of the ''other specified'' subcategory (O99.8) as displayed in the following table.

Subcategories within ICD-10-CM Category O99 Other Maternal Diseases Classifiable Elsewhere But Complicating Pregnancy, Childbirth and the Puerperium	
Subcategory	**Description**
O99.0	Anemia complicating pregnancy, childbirth, and the puerperium
O99.1	Other diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism complicating pregnancy, childbirth and the puerperium
O99.2	Endocrine, nutritional and metabolic diseases complicating pregnancy, childbirth and the puerperium
O99.3	Mental disorders in diseases of the nervous system complicating pregnancy, childbirth and the puerperium
O99.4	Diseases of the circulatory system complicating pregnancy, childbirth and the puerperium
O99.5	Diseases of the respiratory system complicating pregnancy, childbirth and the puerperium
O99.6	Diseases of the digestive system complicating pregnancy, childbirth and the puerperium
O99.7	Diseases of the skin and subcutaneous tissue complicating pregnancy, childbirth and the puerperium
O99.8	Other specified diseases and conditions complicating pregnancy, childbirth and the puerperium

The instructional note at category O99 states ''use additional code to identify specific condition'' and included at each subcategory (O99.0–O99.7) are a range of codes that refer to diagnoses that are associated with the condition in the title of the subcategory that are to be reported in addition to the applicable code within the respective subcategory. For example, at subcategory O99.0 (Anemia complicating pregnancy, childbirth, and the puerperium), the range of associated codes to identify the specific condition (for example, type of anemia) includes conditions in diagnosis code range D50–D64, meaning that when any one of the diagnosis codes under subcategory O99.0 describing anemia complicating a specific obstetric stage (pregnancy, childbirth, or puerperium) is reported, a code within the D50–D64 code range to identify the specific type of anemia would also be expected to be reported when supported by the medical record documentation. It is therefore reasonable to associate the two conditions (one from subcategory O99.0 and one from code range D50–D64) when reported on a claim. However, the same cannot be stated for subcategory O99.8. There is no range of associated codes from which users are instructed to report located at this particular subcategory in addition to the specific code under sub-subcategory O99.89 (Other specified diseases and conditions complicating pregnancy, childbirth and the puerperium). We note that subcategory O99.8 and sub-subcategory O99.89 have the same title. Therefore, when a diagnosis code from other than that sub-subcategory is reported that describes a condition occurring in any one of the obstetric stages (pregnancy, childbirth, or puerperium) it is not clear if the condition can reasonably be associated to correspond to the ''other specified diseases and conditions'' diagnosis. In addition, the code ranges included at subcategory O99.8 are D00–D48, H00–H95, M00–N99, and Q00–Q99. Consequently, diagnosis codes within those code ranges would be expected to be reported with one of the diagnosis codes under subcategory O99.8 when reported as a principal diagnosis.

In all three of the requestor's examples, the diagnosis codes provided for CMS to review and consider are located in the ''O'' code range (O72.1, O98.32, and O87.2 in addition to O99.891, O99.892, and O99.893). As noted previously, the code ranges included at subcategory O99.8 as listed, do not include any codes in ''O'' code range. Upon review of the diagnosis codes provided by the requestor, it is also reasonable to expect that any one of those diagnosis codes (O72.1, O98.32, and O87.2) could be reported as a principal diagnosis alone. For instance, there are no instructional notes at diagnosis code O72.1 that preclude that diagnosis code from being reported as the principal diagnosis.

During our review of the CC Exclusions List logic in response to the requestor's recommendations, we also identified some diagnosis codes describing the specific trimester of pregnancy that we believe warrant further examination. We are unable to fully evaluate these conditions for FY 2022, therefore, we will continue to analyze for future rulemaking.

For the reasons discussed, we do not believe that any of the three diagnosis codes (O99.891, O99.892, and O99.893), when reported as a principal diagnosis, should exclude any CC secondary diagnosis. Therefore, we are proposing to remove diagnosis codes O99.891, O99.892, and O99.893 from the CC Exclusions List logic principal diagnosis collection lists. Specifically, we are proposing to remove those diagnosis codes from the following principal

diagnosis collection list numbers 0085, 0954, 0956 through 0963, 0972, 0988, 0991 through 0998, 1000 through 1002, 1004, 1006, 1009, 1011, 1014, 1015, 1019, 3999, 4000, 4002 through 4006, 4008, 4010, through 4013, 4017, 4020, 4021, 4023 through 4026, 4030, 4031, 4033 through 4043, 4050 through 4054, 4059 through 4063, 4065 and 4067, effective FY 2022.

We also received a request to review diagnosis codes describing oxygen dependence, chronic obstructive pulmonary disease with exacerbation, and chronic respiratory failure with regard to assignment in MS–DRG 191 (Chronic Obstructive Pulmonary Disease with CC) and to consider whether any changes to principal diagnosis collection number 0744 in the CC Exclusions List logic are warranted.

The requestor provided diagnosis codes J44.1 (Chronic obstructive pulmonary disease with (acute) exacerbation), J96.11 (Chronic respiratory failure with hypoxia (CC)) and Z99.81 (Dependence on supplemental oxygen) for CMS to review. Specifically, the requestor suggested that if oxygen dependence, by definition, is clinically inherent to chronic respiratory failure, then CMS should consider adding diagnosis code J44.1 to the CC Exclusions List logic principal diagnosis collection list number 0744 and cause diagnosis code J96.11 to be considered as a NonCC when J44.1 is reported as the principal diagnosis.

We reviewed the diagnosis codes and MS–DRG assignment as the requestor suggested. We confirmed that when diagnosis code J44.1 is reported as the principal diagnosis with the CC secondary diagnosis code J96.11, and secondary diagnosis code Z99.81, the resulting MS–DRG assignment is MS–DRG 191. We believe that diagnosis code J96.11 should continue to group as a CC, to the ''with CC'' MS–DRG 191, when reported as a secondary diagnosis code with diagnosis code J44.1 reported as the principal diagnosis. We disagree with the requestor's suggestion that every oxygen-dependent COPD patient has chronic respiratory failure, and that separately reporting the chronic respiratory failure is clinically redundant. Patients can be oxygen-dependent with COPD and not have a diagnosis of chronic respiratory failure. Therefore, we are proposing to maintain the structure of principal diagnosis collection list number 0744 in the CC Exclusions List logic for FY 2022.

Finally, we received a request to reconsider the MCC exclusions for diagnosis code I11.0 (Hypertensive heart disease with heart failure) when reported as the principal diagnosis. According to the requestor, there appears to be an inconsistency for the CC Exclusions List logic. Specifically, the requestor noted that when diagnosis code I11.0 is reported as the principal diagnosis, it causes the following MCC secondary diagnosis codes to be considered as a NonCC.

ICD-10-CM Code	Code Description
I50.23	Acute on chronic systolic (congestive) heart failure
I50.33	Acute on chronic diastolic (congestive) heart failure
I50.41	Acute combined systolic (congestive) and diastolic (congestive) heart failure
I50.43	Acute on chronic combined systolic (congestive) and diastolic (congestive) heart failure

However, the requestor stated that diagnosis codes I50.21 (Acute systolic (congestive) heart failure) and I50.31 (Acute diastolic (congestive) heart failure) are not excluded from acting as MCCs when diagnosis code I11.0 is reported as the principal diagnosis. The requestor also stated that all diagnosis codes in category I50 (Heart Failure) share common etiologies and demonstrate comparable severity of illness. Therefore, the requestor suggested that none of the conditions in this category (I50) should be excluded from acting as a MCC when diagnosis code I11.0 is reported as a principal diagnosis.

We examined all the diagnosis codes in category I50 with regard to the CC Exclusions List logic. In addition to diagnosis code I11.0, we also reviewed diagnosis code I13.2 (Hypertensive heart and chronic kidney disease with heart failure and with stage 5 chronic kidney disease, or end stage renal disease) when reported as a principal diagnosis because that diagnosis code also has the Tabular instruction ''use additional code to identify the type of heart failure''.

We found additional inconsistencies in the CC secondary diagnosis heart failure codes where some diagnoses were excluded depending on the principal diagnosis reported and others were not excluded. As a result, we are proposing to revise the CC Exclusions Logic list for diagnosis codes I11.0 and I13.2 when reported as a principal diagnosis to ensure they are consistent in the CC and MCC diagnoses they exclude. In the following table we show the findings for each diagnosis code in category I50 with respect to the current severity level (MCC, CC or NonCC), if it is currently excluded as a CC or MCC when reported with either diagnosis code I11.0 or I13.2 as the principal diagnosis, and what our proposal is under the CC Exclusions List logic for FY 2022.

BILLING CODE 4120–01–P

ICD-10-CM Code	Code Description	Principal Diagnosis I11.0	Principal Diagnosis I13.2	Proposal for FY 2022
I50.1 (CC)	Left ventricular failure, unspecified	Excluded	Not excluded	Add to CC Exclusion List for Principal Dx I13.2
I50.20 (CC)	Unspecified systolic (congestive) heart failure	Excluded	Not excluded	Add to CC Exclusion List for Principal Dx I13.2
I50.21 (MCC)	Acute systolic (congestive) heart failure	Not excluded	Not excluded	No change
I50.22 (CC)	Chronic systolic (congestive) heart failure	Excluded	Not excluded	Add to CC Exclusion List for Principal Dx I13.2
I50.23 (MCC)	Acute on chronic systolic (congestive) heart failure	Excluded	Not excluded	Remove from CC Exclusion List for Principal Dx I11.0
I50.30 (CC)	Unspecified diastolic (congestive) heart failure	Excluded	Not excluded	Add to CC Exclusion List for Principal Dx I13.2
I50.31 (MCC)	Acute diastolic (congestive) heart failure	Not excluded	Not excluded	No change
I50.32 (CC)	Chronic diastolic (congestive) heart failure	Excluded	Not excluded	Add to CC Exclusion List for Principal Dx I13.2
I50.33 (MCC)	Acute on chronic diastolic (congestive) heart failure	Excluded	Not excluded	Remove from CC Exclusion List for Principal Dx I11.0
I50.40 (CC)	Unspecified combined systolic (congestive) and diastolic (congestive) heart failure	Excluded	Not excluded	Add to CC Exclusion List for Principal Dx I13.2
I50.41 (MCC)	Acute combined systolic (congestive) and diastolic (congestive) heart failure	Excluded	Not excluded	Remove from CC Exclusion List for Principal Dx I11.0
I50.42 (CC)	Chronic combined systolic (congestive) and diastolic (congestive) heart failure	Excluded	Not excluded	Add to CC Exclusion List for Principal Dx I13.2

I50.43 (MCC)	Acute on chronic combined systolic (congestive) and diastolic (congestive) heart failure	Excluded	Not excluded	Remove from CC Exclusion List for Principal Dx I11.0
I50.810 (NonCC)	Right heart failure, unspecified	Not excluded	Not excluded	No change
I50.811 (NonCC)	Acute right heart failure	Not excluded	Not excluded	No change
I50.812 (NonCC)	Chronic right heart failure	Not excluded	Not excluded	No change
I50.813 (NonCC)	Acute on chronic right heart failure	Not excluded	Not excluded	No change
I50.814 (NonCC)	Right heart failure due to left heart failure	Not excluded	Not excluded	No change
I50.82 (NonCC)	Biventricular heart failure	Not excluded	Not excluded	No change
I50.83 (NonCC)	High output heart failure	Not excluded	Not excluded	No change
I50.84 (NonCC)	End stage heart failure	Not excluded	Not excluded	No change
I50.89 (NonCC)	Other heart failure	Not excluded	Not excluded	No change
I50.9 (NonCC)	Heart failure, unspecified	Not excluded	Not excluded	No change

BILLING CODE 4120–01–C

We are proposing additional changes to the ICD–10 MS–DRGs Version 39 CC Exclusion List based on the diagnosis and procedure code updates as discussed in section II.D.13. of this FY 2022 IPPS/LTCH PPS proposed rule. Therefore, we have developed Table 6G.1.—Proposed Secondary Diagnosis Order Additions to the CC Exclusions List—FY 2022; Table 6G.2.—Proposed Principal Diagnosis Order Additions to the CC Exclusions List—FY 2022; Table 6H.1.—Proposed Secondary Diagnosis Order Deletions to the CC Exclusions List—FY 2022; and Table 6H.2.—Proposed Principal Diagnosis Order Deletions to the CC Exclusions List—FY 2022. For Table 6G.1, each secondary diagnosis code proposed for addition to the CC Exclusion List is shown with an asterisk and the principal diagnoses proposed to exclude the secondary diagnosis code are provided in the indented column immediately following it. For Table 6G.2, each of the principal diagnosis codes for which there is a CC exclusion is shown with an asterisk and the conditions proposed for addition to the CC Exclusion List that will not count as a CC are provided in an indented column immediately following the affected principal diagnosis. For Table 6H.1, each secondary diagnosis code proposed for deletion from the CC Exclusion List is shown with an asterisk followed by the principal diagnosis codes that currently exclude it. For Table 6H.2, each of the principal diagnosis codes is shown with an asterisk and the proposed deletions to the CC Exclusions List are provided in an indented column immediately following the affected principal diagnosis. Tables 6G.1., 6G.2., 6H.1., and 6H.2. associated with this proposed rule are available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html.*

13. Proposed Changes to the ICD–10–CM and ICD–10–PCS Coding Systems

To identify new, revised and deleted diagnosis and procedure codes, for FY 2022, we have developed Table 6A.—New Diagnosis Codes, Table 6B.—New Procedure Codes, Table 6C.—Invalid Diagnosis Codes, Table 6D.—Invalid Procedure Codes and Table 6E.—Revised Diagnosis Code Titles for this proposed rule.

These tables are not published in the Addendum to this proposed rule, but are available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* as described in section VI. of the Addendum to this proposed rule. As discussed in section II.D.16. of the preamble of this proposed rule, the code titles are adopted as part of the ICD–10 (previously ICD–9–CM) Coordination and Maintenance Committee meeting process. Therefore, although we publish the code titles in the IPPS proposed and final rules, they are not subject to comment in the proposed or final rules.

We are proposing the MDC and MS–DRG assignments for the new diagnosis codes and procedure codes as set forth in Table 6A.—New Diagnosis Codes and Table 6B.—New Procedure Codes. In addition, the proposed severity level designations for the new diagnosis codes are set forth in Table 6A. and the proposed O.R. status for the new procedure codes are set forth in Table 6B. Consistent with our established process, we examined the MS–DRG assignment and the attributes (severity level and O.R. status) of the predecessor diagnosis or procedure code, as applicable, to inform our proposed assignments and designations. Specifically, we review the predecessor code and MS–DRG assignment most closely associated with the new diagnosis or procedure code, and in the absence of claims data, we consider other factors that may be relevant to the MS–DRG assignment, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the condition. We note that this process does not automatically result in the new diagnosis or procedure code being proposed for assignment to the same MS–DRG or to have the same designation as the predecessor code.

We are making available on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* the following tables associated with this proposed rule:

- Table 6A.—New Diagnosis Codes—FY 2022;
- Table 6B.—New Procedure Codes—FY 2022;
- Table 6C.—Invalid Diagnosis Codes—FY 2022;
- Table 6D.—Invalid Procedure Codes—FY 2022;
- Table 6E.—Revised Diagnosis Code Titles—FY 2022;
- Table 6G.1.—Proposed Secondary Diagnosis Order Additions to the CC Exclusions List—FY 2022;
- Table 6G.2.—Proposed Principal Diagnosis Order Additions to the CC Exclusions List—FY 2022;
- Table 6H.1.—Proposed Secondary Diagnosis Order Deletions to the CC Exclusions List—FY 2022;
- Table 6H.2.—Proposed Principal Diagnosis Order Deletions to the CC Exclusions List—FY 2022;
- Table 6I.1.—Proposed Additions to the MCC List—FY 2022;
- Table 6I.2.—Proposed Deletions to the MCC List—FY 2022; and
- Table 6J.1.—Proposed Additions to the CC List—FY 2022.

14. Proposed Changes to the Medicare Code Editor (MCE)

The Medicare Code Editor (MCE) is a software program that detects and reports errors in the coding of Medicare claims data. Patient diagnoses, procedure(s), and demographic information are entered into the Medicare claims processing systems and are subjected to a series of automated screens. The MCE screens are designed to identify cases that require further review before classification into an MS–DRG.

As discussed in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58448), we made available the FY 2021 ICD–10 MCE Version 38 manual file. The manual contains the definitions of the Medicare code edits, including a description of each coding edit with the corresponding diagnosis and procedure code edit lists. The link to this MCE manual file, along with the link to the mainframe and computer software for the MCE Version 38 (and ICD–10 MS–DRGs) are posted on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software*.

For this FY 2022 IPPS/LTCH PPS proposed rule, we address the MCE requests we received by the November 1, 2020 deadline. We also discuss the proposals we are making based on our internal review and analysis.

a. External Causes of Morbidity Codes as Principal Diagnosis

In the MCE, the external cause codes (V, W, X, or Y codes) describe the circumstance causing an injury, not the nature of the injury, and therefore should not be used as a principal diagnosis.

As discussed in section II.D.13. of the preamble of this proposed rule, Table 6A.—New Diagnosis Codes, lists the diagnosis codes that have been approved to date which will be effective with discharges on and after October 1, 2021. We are proposing to add the following new ICD–10–CM diagnosis codes to the External Causes of Morbidity edit code list.

ICD-10-CM code	Code description
Y35.899A	Legal intervention involving other specified means, unspecified person injured, initial encounter
Y35.899D	Legal intervention involving other specified means, unspecified person injured, subsequent encounter
Y35.899S	Legal intervention involving other specified means, unspecified person injured, sequela

b. Age Conflict Edit

In the MCE, the Age conflict edit exists to detect inconsistencies between a patient's age and any diagnosis on the patient's record; for example, a 5-year-old patient with benign prostatic hypertrophy or a 78-year-old patient coded with a delivery. In these cases, the diagnosis is clinically and virtually impossible for a patient of the stated age. Therefore, either the diagnosis or the age is presumed to be incorrect. Currently, in the MCE, the following four age diagnosis categories appear under the Age conflict edit and are listed in the manual and written in the software program:

- Perinatal/Newborn—Age 0 years only; a subset of diagnoses which will only occur during the perinatal or newborn period of age 0 (for example, tetanus neonatorum, health examination for newborn under 8 days old).
- Pediatric—Age is 0–17 years inclusive (for example, Reye's syndrome, routine child health exam).
- Maternity—Age range is 9–64 years inclusive (for example, diabetes in pregnancy, antepartum pulmonary complication).
- Adult—Age range is 15–124 years inclusive (for example, senile delirium, mature cataract).

(1) Pediatric Diagnoses

Under the ICD–10 MCE, the Pediatric diagnoses category for the Age conflict edit considers the age range of 0 to 17 years inclusive. For that reason, the diagnosis codes on this Age conflict edit list would be expected to apply to conditions or disorders specific to that age group only.

As discussed in section II.D.13. of the preamble of this proposed rule, Table 6A.—New Diagnosis Codes, lists the diagnosis codes that have been approved to date which will be effective with discharges on and after October 1, 2021. We are proposing to add the following new ICD–10–CM diagnosis codes to the Pediatric diagnoses category code list under the Age conflict edit.

ICD-10-CM code	Code description
R63.31	Pediatric feeding disorder, acute
R63.32	Pediatric feeding disorder, chronic

c. Sex Conflict Edit

In the MCE, the Sex conflict edit detects inconsistencies between a patient's sex and any diagnosis or procedure on the patient's record; for example, a male patient with cervical cancer (diagnosis) or a female patient with a prostatectomy (procedure). In both instances, the indicated diagnosis or the procedure conflicts with the stated sex of the patient. Therefore, the patient's diagnosis, procedure, or sex is presumed to be incorrect.

(1) Diagnoses for Females Only Edit

As discussed in section II.D.13. of the preamble of this proposed rule, Table 6A.—New Diagnosis Codes, lists the new diagnosis codes that have been approved to date which will be effective with discharges on and after October 1, 2021. We are proposing to add the following new ICD–10–CM diagnosis codes to the edit code list for the Diagnoses for Females Only edit.

ICD-10-CM code	Code description
C56.3	Malignant neoplasm of bilateral ovaries
C79.63	Secondary malignant neoplasm of bilateral ovaries

d. Unacceptable Principal Diagnosis Edit

In the MCE, there are select codes that describe a circumstance which influences an individual's health status but does not actually describe a current illness or injury. There also are codes that are not specific manifestations but may be due to an underlying cause. These codes are considered unacceptable as a principal diagnosis. In limited situations, there are a few codes on the MCE Unacceptable Principal Diagnosis edit code list that are considered ''acceptable'' when a specified secondary diagnosis is also coded and reported on the claim.

As discussed in Section II.D.13. of the preamble of this proposed rule, Table 6A.—New Diagnosis Codes, lists the new diagnosis codes that have been approved to date which will be effective with discharges on and after October 1, 2021. In addition, as a result of proposed new instructional notes to ''Code first underlying disease'' (which indicate the proper sequencing order of the codes) for existing diagnosis codes found at subcategory M40.1 (Other secondary kyphosis) and subcategory M41.5 (Other secondary scoliosis) discussed at the September 8–9, 2020 ICD–10 Coordination and Maintenance Committee meeting, we are proposing to add the following new and, if these instructional notes are finalized, existing ICD–10–CM diagnosis codes at subcategories M40.1 and M41.5, to the Unacceptable Principal Diagnosis edit code list.

BILLING CODE 4120–01–P

ICD-10-CM code	Code description
G92.00	Immune effector cell-associated neurotoxicity syndrome, grade unspecified
G92.01	Immune effector cell-associated neurotoxicity syndrome, grade 1
G92.02	Immune effector cell-associated neurotoxicity syndrome, grade 2
G92.03	Immune effector cell-associated neurotoxicity syndrome, grade 3
G92.04	Immune effector cell-associated neurotoxicity syndrome, grade 4
G92.05	Immune effector cell-associated neurotoxicity syndrome, grade 5
M40.10	Other secondary kyphosis, site unspecified
M40.12	Other secondary kyphosis, cervical region
M40.13	Other secondary kyphosis, cervicothoracic region
M40.14	Other secondary kyphosis, thoracic region
M40.15	Other secondary kyphosis, thoracolumbar region
M41.50	Other secondary scoliosis, site unspecified
M41.52	Other secondary scoliosis, cervical region
M41.53	Other secondary scoliosis, cervicothoracic region
M41.54	Other secondary scoliosis, thoracic region
M41.55	Other secondary scoliosis, thoracolumbar region
M41.56	Other secondary scoliosis, lumbar region
M41.57	Other secondary scoliosis, lumbosacral region
R0.54	Cough syncope
S06.A0XA	Traumatic brain compression without herniation, initial encounter
S06.A0XD	Traumatic brain compression without herniation, subsequent encounter
S06.A0XS	Traumatic brain compression without herniation, sequela
S06.A1XA	Traumatic brain compression with herniation, initial encounter
S06.A1XD	Traumatic brain compression with herniation, subsequent encounter
S06.A1XS	Traumatic brain compression with herniation, sequela
T40.715A	Adverse effect of cannabis, initial encounter
T40.715D	Adverse effect of cannabis, subsequent encounter
T40.715S	Adverse effect of cannabis, sequela
T40.716A	Underdosing of cannabis, initial encounter
T40.716D	Underdosing of cannabis, subsequent encounter
T40.716S	Underdosing of cannabis, sequela
T40.725A	Adverse effect of synthetic cannabinoids, initial encounter
T40.725D	Adverse effect of synthetic cannabinoids, subsequent encounter
T40.725S	Adverse effect of synthetic cannabinoids, sequela
T40.726A	Underdosing of synthetic cannabinoids, initial encounter
T40.726D	Underdosing of synthetic cannabinoids, subsequent encounter
T40.726S	Underdosing of synthetic cannabinoids, sequela
Z71.85	Encounter for immunization safety counseling
Z91.014	Allergy to mammalian meats
Z91.51	Personal history of suicidal behavior
Z91.52	Personal history of nonsuicidal self-harm
Z92.850	Personal history of Chimeric Antigen Receptor T-cell therapy
Z92.858	Personal history of other cellular therapy
Z92.859	Personal history of cellular therapy, unspecified
Z92.86	Personal history of gene therapy

BILLING CODE 4120–01–C

In addition, as discussed in section II.D.13. of the preamble of this proposed rule, Table 6C.—Invalid Diagnosis Codes, lists the diagnosis codes that are

no longer effective October 1, 2021. Included in this table are the following ICD–10–CM diagnosis codes that are currently listed on the Unacceptable Principal Diagnosis edit code list. We are proposing to delete these codes from the Unacceptable Principal Diagnosis edit code list.

ICD-10-CM code	Code description
T40.7X5A	Adverse effect of cannabis (derivatives), initial encounter
T40.7X5D	Adverse effect of cannabis (derivatives), subsequent encounter
T40.7X5S	Adverse effect of cannabis (derivatives), sequela
T40.7X6A	Underdosing of cannabis (derivatives), initial encounter
T40.7X6D	Underdosing of cannabis (derivatives), subsequent encounter
T40.7X6S	Underdosing of cannabis (derivatives), sequela
Z91.5	Personal history of self-harm

e. Unspecified Codes

As discussed in section II.D.12.c. of the preamble of this proposed rule, we are requesting public comments on a potential change to the severity level designations for ''unspecified'' ICD–10–CM diagnosis codes that we are considering adopting for FY 2022. In connection with that request, we are also requesting public comments on the potential creation of a new MCE code edit involving these ''unspecified'' codes for FY 2022. Specifically, this MCE code edit could trigger when an ''unspecified'' diagnosis code currently designated as either a CC or MCC, that includes other codes available in that code subcategory that further specify the anatomic site, is entered. We refer the reader to table 6P.3a (which is available via the internet on the CMS website at: *http://www.cms.hhs.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) for the list of unspecified diagnosis codes that would be subject to this edit. This edit could signal to the provider that a more specific code is available to report. We believe this edit aligns with documentation improvement efforts and leverages the specificity within ICD–10. As part of our request for comment on the potential creation of this new MCE code edit for these ''unspecified'' codes, we are interested in comments on how this MCE code edit may be developed for FY 2022 to more accurately reflect each health care encounter and improve the reliability and validity of the coded data.

f. Future Enhancement

In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38053 through 38054) we noted the importance of ensuring accuracy of the coded data from the reporting, collection, processing, coverage, payment and analysis aspects. Subsequently, in the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20235) we stated that we engaged a contractor to assist in the review of the limited coverage and non-covered procedure edits in the MCE that may also be present in other claims processing systems that are utilized by our MACs. The MACs must adhere to criteria specified within the National Coverage Determinations (NCDs) and may implement their own edits in addition to what is already incorporated into the MCE, resulting in duplicate edits. The objective of this review is to identify where duplicate edits may exist and to determine what the impact might be if these edits were to be removed from the MCE.

We have also noted that the purpose of the MCE is to ensure that errors and inconsistencies in the coded data are recognized during Medicare claims processing. As we indicated in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41228), we are considering whether the inclusion of coverage edits in the MCE necessarily aligns with that specific goal because the focus of coverage edits is on whether or not a particular service is covered for payment purposes and not whether it was coded correctly.

As we continue to evaluate the purpose and function of the MCE with respect to ICD–10, we encourage public input for future discussion. As we have discussed in prior rulemaking, we recognize a need to further examine the current list of edits and the definitions of those edits. We continue to encourage public comments on whether there are additional concerns with the current edits, including specific edits or language that should be removed or revised, edits that should be combined, or new edits that should be added to assist in detecting errors or inaccuracies in the coded data. Comments should be directed to the MS–DRG Classification Change Mailbox located at *MSDRGClassificationChange@cms.hhs.gov* by November 1, 2021.

15. Proposed Changes to Surgical Hierarchies

Some inpatient stays entail multiple surgical procedures, each one of which, occurring by itself, could result in assignment of the case to a different MS–DRG within the MDC to which the principal diagnosis is assigned. Therefore, it is necessary to have a decision rule within the GROUPER by which these cases are assigned to a single MS–DRG. The surgical hierarchy, an ordering of surgical classes from most resource-intensive to least resource-intensive, performs that function. Application of this hierarchy ensures that cases involving multiple surgical procedures are assigned to the MS–DRG associated with the most resource-intensive surgical class.

A surgical class can be composed of one or more MS–DRGs. For example, in MDC 11, the surgical class ''kidney transplant'' consists of a single MS–DRG (MS–DRG 652) and the class ''major bladder procedures'' consists of three MS–DRGs (MS–DRGs 653, 654, and 655). Consequently, in many cases, the surgical hierarchy has an impact on more than one MS–DRG. The methodology for determining the most resource-intensive surgical class involves weighting the average resources for each MS–DRG by frequency to determine the weighted average resources for each surgical class. For example, assume surgical class A includes MS–DRGs 001 and 002 and surgical class B includes MS–DRGs 003, 004, and 005. Assume also that the average costs of MS–DRG 001 are higher than that of MS–DRG 003, but the average costs of MS–DRGs 004 and 005

are higher than the average costs of MS–DRG 002. To determine whether surgical class A should be higher or lower than surgical class B in the surgical hierarchy, we would weigh the average costs of each MS–DRG in the class by frequency (that is, by the number of cases in the MS–DRG) to determine average resource consumption for the surgical class. The surgical classes would then be ordered from the class with the highest average resource utilization to that with the lowest, with the exception of ''other O.R. procedures'' as discussed in this proposed rule.

This methodology may occasionally result in assignment of a case involving multiple procedures to the lower-weighted MS–DRG (in the highest, most resource-intensive surgical class) of the available alternatives. However, given that the logic underlying the surgical hierarchy provides that the GROUPER search for the procedure in the most resource-intensive surgical class, in cases involving multiple procedures, this result is sometimes unavoidable.

We note that, notwithstanding the foregoing discussion, there are a few instances when a surgical class with a lower average cost is ordered above a surgical class with a higher average cost. For example, the ''other O.R. procedures'' surgical class is uniformly ordered last in the surgical hierarchy of each MDC in which it occurs, regardless of the fact that the average costs for the MS–DRG or MS–DRGs in that surgical class may be higher than those for other surgical classes in the MDC. The ''other O.R. procedures'' class is a group of procedures that are only infrequently related to the diagnoses in the MDC, but are still occasionally performed on patients with cases assigned to the MDC with these diagnoses. Therefore, assignment to these surgical classes should only occur if no other surgical class more closely related to the diagnoses in the MDC is appropriate.

A second example occurs when the difference between the average costs for two surgical classes is very small. We have found that small differences generally do not warrant reordering of the hierarchy because, as a result of reassigning cases on the basis of the hierarchy change, the average costs are likely to shift such that the higher-ordered surgical class has lower average costs than the class ordered below it.

For this FY 2022 IPPS/LTCH PPS proposed rule, we received a request to examine the MS–DRG hierarchy within MDC 05 (Diseases and Disorders of the Circulatory System). The requestor stated its request to review the hierarchy within MDC 05 was based on the relative weights within each MS–DRG subdivision which they stated are supportive of higher position within the hierarchy. The requestor stated that when multiple procedures are performed, it is reasonable for providers to be compensated for the highest weighted procedure. The requestor did not specify which data year it analyzed to identify the relative weights. As discussed in this section, in reviewing the surgical hierarchy, we weigh the average costs of each MS–DRG in the class by frequency (that is, by the number of cases in the MS–DRG), not the relative weights of each MS–DRG as suggested by the requestor, to determine average resource consumption for the surgical class; therefore, consistent with our annual process, we used the methodology as described previously to review the surgical hierarchy within MDC 05.

Based on our review of the surgical hierarchy within MDC 05 in response to this request, and in response to the request we received to review the MS–DRG assignments for cases involving the surgical ablation procedure for atrial fibrillation as discussed in section II.D.5.e. of the preamble of this proposed rule, we are proposing to revise the surgical hierarchy for the MS–DRGs in MDC 05 for FY 2022. Specifically, we are proposing to sequence MS–DRGs 231–236 above MS–DRGs 222–227 and below MS–DRGs 216–221, sequence MS–DRGs 222–227 above MS–DRGs 266–227 and below MS–DRGs 231–236, sequence MS–DRGs 266–267 above MS–DRGs 268–269 and below MS–DRGs 222–227, sequence MS–DRGs 228–229 above MS–DRGs 319–320 and below MS–DRGs 268–269.

Our proposal for Appendix D MS–DRG Surgical Hierarchy by MDC and MS–DRG of the ICD–10 MS–DRG Definitions Manual Version 39 is illustrated in the following table.

Proposed Surgical Hierarchy: MDC 05	
215	Other Heart Assist System Implant
216 – 221	Cardiac Valve and Other Major Cardiothoracic Procedures
231 – 236	Coronary Bypass
222 – 227	Cardiac Defibrillator Implant
266 – 267	Endovascular Cardiac Valve Replacement and Supplement Procedures
268 – 269	Aortic and Heart Assist Procedures
228 – 229	Other Cardiothoracic Procedures
319 – 320	Other Endovascular Cardiac Valve Procedures

16. Maintenance of the ICD–10–CM and ICD–10–PCS Coding Systems

In September 1985, the ICD–9–CM Coordination and Maintenance Committee was formed. This is a Federal interdepartmental committee, co-chaired by the Centers for Disease Control and Prevention's (CDC) National Center for Health Statistics (NCHS) and CMS, charged with maintaining and updating the ICD–9–CM system. The final update to ICD–9–CM codes was made on October 1, 2013. Thereafter, the name of the Committee was changed to the ICD–10 Coordination and Maintenance Committee, effective with the March 19–20, 2014 meeting. The ICD–10 Coordination and Maintenance Committee addresses updates to the ICD–10–CM and ICD–10–PCS coding systems. The Committee is jointly responsible for approving coding changes, and developing errata, addenda, and other modifications to the coding systems to reflect newly developed procedures and technologies and newly identified diseases. The Committee is also responsible for promoting the use of Federal and non-Federal educational programs and other communication techniques with a view toward standardizing coding applications and upgrading the quality of the classification system.

The official list of ICD–9–CM diagnosis and procedure codes by fiscal year can be found on the CMS website at: *http://cms.hhs.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/*

codes.html. The official list of ICD–10–CM and ICD–10–PCS codes can be found on the CMS website at: *http://www.cms.gov/Medicare/Coding/ICD10/index.html*.

The NCHS has lead responsibility for the ICD–10–CM and ICD–9–CM diagnosis codes included in the Tabular List and Alphabetic Index for Diseases, while CMS has lead responsibility for the ICD–10–PCS and ICD–9–CM procedure codes included in the Tabular List and Alphabetic Index for Procedures.

The Committee encourages participation in the previously mentioned process by health-related organizations. In this regard, the Committee holds public meetings for discussion of educational issues and proposed coding changes. These meetings provide an opportunity for representatives of recognized organizations in the coding field, such as the American Health Information Management Association (AHIMA), the American Hospital Association (AHA), and various physician specialty groups, as well as individual physicians, health information management professionals, and other members of the public, to contribute ideas on coding matters. After considering the opinions expressed during the public meetings and in writing, the Committee formulates recommendations, which then must be approved by the agencies.

The Committee presented proposals for coding changes for implementation in FY 2022 at a public meeting held on September 8–9, 2020 and finalized the coding changes after consideration of comments received at the meetings and in writing by November 09, 2020.

The Committee held its 2021 meeting on March 9–10, 2021. The deadline for submitting comments on these code proposals was April 9, 2021. It was announced at this meeting that any new diagnosis and procedure codes for which there was consensus of public support and for which complete tabular and indexing changes would be made by June 2021 would be included in the October 1, 2021 update to the ICD–10–CM diagnosis and ICD–10–PCS procedure code sets. As discussed in earlier sections of the preamble of this proposed rule, there are new, revised, and deleted ICD–10–CM diagnosis codes and ICD–10–PCS procedure codes that are captured in Table 6A.—New Diagnosis Codes, Table 6B.—New Procedure Codes, Table 6C.—Invalid Diagnosis Codes, Table 6D.—Invalid Procedure Codes, and Table 6E.—Revised Diagnosis Code Titles for this proposed rule, which are available via the internet on the CMS website at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. The code titles are adopted as part of the ICD–10 (previously ICD–9–CM) Coordination and Maintenance Committee process. Therefore, although we make the code titles available for the IPPS proposed rule, they are not subject to comment in the proposed rule. Because of the length of these tables, they are not published in the Addendum to the proposed rule. Rather, they are available via the internet as discussed in section VI. of the Addendum to the proposed rule.

Recordings for the virtual meeting discussions of the procedure codes at the Committee's September 8–9, 2020 meeting and the March 9–10, 2021 meeting can be obtained from the CMS website at: *https://www.cms.gov/Medicare/Coding/ICD10/C-and-M-Meeting-Materials*. The materials for the discussions relating to diagnosis codes at the September 8–9, 2020 meeting and March 9–10, 2021 meeting can be found at: *http://www.cdc.gov/nchs/icd/icd10cm_maintenance.html*. These websites also provide detailed information about the Committee, including information on requesting a new code, participating in a Committee meeting, timeline requirements and meeting dates.

We encourage commenters to submit questions and comments on coding issues involving diagnosis codes via Email to: *nchsicd10cm@cdc.gov*.

Questions and comments concerning the procedure codes should be submitted via Email to: *ICDProcedureCodeRequest@cms.hhs.gov*.

As a result of the ongoing COVID–19 public health emergency, the CDC implemented six new diagnosis codes describing conditions related to COVID–19 into the ICD–10–CM effective with discharges on and after January 1, 2021. The diagnosis codes are

ICD-10-CM code	Code description
J12.82	Pneumonia due to coronavirus disease 2019
M35.81	Multisystem inflammatory syndrome (MIS)
M35.89	Other specified systemic involvement of connective tissue
Z11.52	Encounter for screening for COVID-19
Z20.822	Contact with and (suspected) exposure to COVID-19
Z86.16	Personal history of COVID-19

We refer the reader to the CDC web page at *https://www.cdc.gov/nchs/icd/icd10cm.htm* for additional details regarding the implementation of these new diagnosis codes.

We provided the MS–DRG assignments for the six diagnosis codes effective with discharges on and after January 1, 2021, consistent with our established process for assigning new diagnosis codes. Specifically, we review the predecessor diagnosis code and MS–DRG assignment most closely associated with the new diagnosis code, and consider other factors that may be relevant to the MS–DRG assignment, including the severity of illness, treatment difficulty, and the resources utilized for the specific condition/diagnosis. We note that this process does not automatically result in the new

diagnosis code being assigned to the same MS–DRG as the predecessor code. The assignments for the previously listed diagnosis codes are reflected in Table 6A- New Diagnosis Codes (which is available via the internet on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*). As with the other new diagnosis codes and MS–DRG assignments included in Table 6A of this proposed rule, we are soliciting public comments on the most appropriate MDC, MS–DRG, and severity level assignments for these codes for FY 2022, as well as any other options for the GROUPER logic.

In addition, CMS implemented 21 new procedure codes describing the introduction or infusion of therapeutics, including monoclonal antibodies and vaccines for COVID–19 treatment, into the ICD–10–PCS effective with discharges on and after January 01, 2021. The 21 procedure codes listed in this section of this rule are designated as non-O.R. and do not affect any MDC or MS–DRG assignment as shown in the following table

BILLING CODE 4120–01–P

ICD-10-PCS Code	Description	O.R.	MDC	MS-DRG
XW013H6	Introduction of other new technology monoclonal antibody into subcutaneous tissue, percutaneous approach, new technology group 6	N		
XW013K6	Introduction of leronlimab monoclonal antibody into subcutaneous tissue, percutaneous approach, new technology group 6	N		
XW013S6	Introduction of COVID-19 vaccine dose 1 into subcutaneous tissue, percutaneous approach, new technology group 6	N		

XW013T6	Introduction of COVID-19 vaccine dose 2 into subcutaneous tissue, percutaneous approach, new technology group 6	N		
XW013U6	Introduction of COVID-19 vaccine into subcutaneous tissue, percutaneous approach, new technology group 6	N		
XW023S6	Introduction of COVID-19 vaccine dose 1 into muscle, percutaneous approach, new technology group 6	N		
XW023T6	Introduction of COVID-19 vaccine dose 2 into muscle, percutaneous approach, new technology group 6	N		
XW023U6	Introduction of COVID-19 vaccine into muscle, percutaneous approach, new technology group 6	N		
XW033E6	Introduction of etesevimab monoclonal antibody into peripheral vein, percutaneous approach, new technology group 6	N		
XW033F6	Introduction of bamlanivimab monoclonal antibody into peripheral vein, percutaneous approach, new technology group 6	N		
XW033G6	Introduction of REGN-COV2 monoclonal antibody into peripheral vein, percutaneous approach, new technology group 6	N		
XW033H6	Introduction of other new technology monoclonal antibody into peripheral vein, percutaneous approach, new technology group 6	N		
XW033L6	Introduction of CD24Fc immunomodulator into peripheral vein, percutaneous approach, new technology group 6	N		
XW043E6	Introduction of etesevimab monoclonal antibody into central vein, percutaneous approach, new technology group 6	N		
XW043F6	Introduction of bamlanivimab monoclonal antibody into central vein, percutaneous approach, new technology group 6	N		
XW043G6	Introduction of REGN-COV2 monoclonal antibody into central vein, percutaneous approach, new technology group 6	N		
XW043H6	Introduction of other new technology monoclonal antibody into central vein, percutaneous approach, new technology group 6	N		
XW043L6	Introduction of CD24Fc immunomodulator into central vein, percutaneous approach, new technology group 6	N		
XW0DXM6	Introduction of baricitinib into mouth and pharynx, external approach, new technology group 6	N		
XW0G7M6	Introduction of baricitinib into upper GI, via natural or artificial opening, new technology group 6	N		
XW0H7M6	Introduction of baricitinib into lower GI, via natural or artificial opening, new technology group 6	N		

BILLING CODE 4120–01–C

The ICD–10 MS–DRG assignment for cases reporting any one of the 21 procedure codes is dependent on the reported principal diagnosis, any secondary diagnoses defined as a CC or MCC, procedures or services performed, age, sex, and discharge status. The 21 procedure codes are reflected in Table 6B—New Procedure Codes (which is available via the internet on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS.)* As with the other new procedure codes and MS–DRG assignments included in Table 6B of this proposed rule, we are soliciting public comments on the most appropriate MDC, MS–DRG, and operating room status assignments for

these codes for FY 2022, as well as any other options for the GROUPER logic.

We note that Change Request (CR) 11895, Transmittal 10654, titled ''Fiscal Year (FY) 2021 Annual Update to the Medicare Code Editor (MCE) and International Classification of Diseases, Tenth Revision, Clinical Modification (ICD–10–CM) and Procedure Coding System (ICD–10–PCS)'', was issued on March 12, 2021 (available via the internet on the CMS website at: *https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/Transmittals/r10654cp*) regarding the release of an updated version of the ICD–10 MS–DRG GROUPER and Medicare Code Editor software, Version 38.1, effective with discharges on and after January 1, 2021, reflecting the new diagnosis and procedure codes. The updated software, along with the updated ICD–10 MS–DRG V38.1 Definitions Manual and the Definitions of Medicare Code Edits V38.1 manual is available at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software*.

In the September 7, 2001 final rule implementing the IPPS new technology add-on payments (66 FR 46906), we indicated we would attempt to include proposals for procedure codes that would describe new technology discussed and approved at the Spring meeting as part of the code revisions effective the following October.

Section 503(a) of Public Law 108–173 included a requirement for updating diagnosis and procedure codes twice a year instead of a single update on October 1 of each year. This requirement was included as part of the amendments to the Act relating to recognition of new technology under the IPPS. Section 503(a) of Public Law 108–173 amended section 1886(d)(5)(K) of the Act by adding a clause (vii) which states that the Secretary shall provide for the addition of new diagnosis and procedure codes on April 1 of each year, but the addition of such codes shall not require the Secretary to adjust the payment (or diagnosis-related group classification) until the fiscal year that begins after such date. This requirement improves the recognition of new technologies under the IPPS by providing information on these new technologies at an earlier date. Data will be available 6 months earlier than would be possible with updates occurring only once a year on October 1.

While section 1886(d)(5)(K)(vii) of the Act states that the addition of new diagnosis and procedure codes on April 1 of each year shall not require the Secretary to adjust the payment, or DRG classification, under section 1886(d) of the Act until the fiscal year that begins after such date, we have to update the DRG software and other systems in order to recognize and accept the new codes. We also publicize the code changes and the need for a mid-year systems update by providers to identify the new codes. Hospitals also have to obtain the new code books and encoder updates, and make other system changes in order to identify and report the new codes.

The ICD–10 (previously the ICD–9–CM) Coordination and Maintenance Committee holds its meetings in the spring and fall in order to update the codes and the applicable payment and reporting systems by October 1 of each year. Items are placed on the agenda for the Committee meeting if the request is received at least 3 months prior to the meeting. This requirement allows time for staff to review and research the coding issues and prepare material for discussion at the meeting. It also allows time for the topic to be publicized in meeting announcements in the **Federal Register** as well as on the CMS website. A complete addendum describing details of all diagnosis and procedure coding changes, both tabular and index, is published on the CMS and NCHS websites in June of each year. Publishers of coding books and software use this information to modify their products that are used by health care providers. Historically, this 5-month time period has proved to be necessary for hospitals and other providers to update their systems.

A discussion of this timeline and the need for changes are included in the December 4–5, 2005 ICD–9–CM Coordination and Maintenance Committee Meeting minutes. The public agreed that there was a need to hold the fall meetings earlier, in September or October, in order to meet the new implementation dates. The public provided comment that additional time would be needed to update hospital systems and obtain new code books and coding software. There was considerable concern expressed about the impact this April update would have on providers.

In the FY 2005 IPPS final rule, we implemented section 1886(d)(5)(K)(vii) of the Act, as added by section 503(a) of Public Law 108–173, by developing a mechanism for approving, in time for the April update, diagnosis and procedure code revisions needed to describe new technologies and medical services for purposes of the new technology add-on payment process. We also established the following process for making these determinations. Topics considered during the Fall ICD–10 (previously ICD–9–CM) Coordination and Maintenance Committee meeting are considered for an April 1 update if a strong and convincing case is made by the requestor during the Committee's public meeting. The request must identify the reason why a new code is needed in April for purposes of the new technology process. Meeting participants and those reviewing the Committee meeting materials are provided the opportunity to comment on this expedited request. All other topics are considered for the October 1 update. Participants of the Committee meeting and those reviewing the Committee meeting materials are encouraged to comment on all such requests. There were no code requests approved for an expedited April 1, 2021 implementation at the September 8–9, 2020 Committee meetings. Therefore, there were no new codes implemented April 1, 2021.

At the March 9–10, 2021 ICD–10 Coordination and Maintenance Committee meeting we announced our consideration of an April 1 implementation date for ICD–10–CM diagnosis and ICD–10–PCS procedure code updates, in addition to the current October 1 annual update for ICD–10–CM diagnosis codes and ICD–10–PCS procedure codes. We stated that this April 1 code update would be in addition to the existing April 1 update under section 1886(d)(5)(k)(vii) of the Act for diagnosis or procedure code revisions needed to describe new technologies and medical services for purposes of the new technology add-on payment process. As explained during the March 9–10, 2021 meeting, we believe this additional April 1 implementation date for new codes would allow for earlier recognition of diagnoses, conditions, and illnesses as well as procedures, services, and treatments in the claims data. We also believe this earlier recognition would be beneficial for purposes of reporting, data collection, tracking clinical outcomes, claims processing, surveillance, research, policy decisions and data interoperability. We note, as previously summarized, that in 2005, in connection with the implementation of the current April 1 update for diagnosis or procedure code revisions for purposes of the new technology add-on payment process, stakeholders expressed concerns with an April 1 update, specifically with regard to the time needed to update hospital systems and obtain new code books and coding software. We believe that the advances in technology that have occurred since

that time, including the use of electronic health records (EHRs), electronic coding books, and updated encoder software that are now utilized by the majority of providers, would alleviate those concerns and make a broader April 1 update more feasible today. Consistent with our established process for the existing April 1 update under section 1886(d)(5)(k)(vii) of the Act, if adopted, any new ICD–10 code updates finalized for implementation on the following April 1 would be announced in November of the prior year, which would provide a 4-month timeframe for the public to receive notice about the diagnosis and/or procedure code updates with respect to the codes, code descriptions, code designations (severity level for diagnosis codes or O.R. status for procedure code) and code assignment under the ICD–10 MS–DRGs. As discussed during the March 9–10, 2021 meeting, all April 1 code update files would be made publicly available by February 1, providing a 2-month timeframe for providers to incorporate systems updates. We also do not anticipate any need for code book publishers to issue new code books as a result of an April 1 code update, if adopted. Rather, as was done in the past at the publisher's discretion, supplemental pages containing the code update information were made available and sent to purchasers of the code book products. We further note that historically, coders would hand-write any updates or notes directly into their code books. In addition, with the availability of electronic code book files, we would anticipate any April 1 code updates, if adopted, could be reasonably completed in the allotted timeframe. For these same reasons, we also do not believe a 5-month time period would continue to be needed to update providers' systems to reflect newly approved coding changes. We further note that if an April 1 update were to be adopted, it could be through a phased approach, such that initially, the number and nature of the code updates would be fewer and less comprehensive as compared to the existing October 1 update. For example, it was discussed during the meeting that consideration could first be given to proposals identified as ''Addenda''. For diagnosis codes, the proposed addenda updates typically consist primarily of minor revisions to the Index and Tabular List, such as corrections to typos and changes to instructional notes. For procedure codes, the proposed addenda updates typically consist primarily of minor revisions to the Index and Tables, such as adding or deleting entries to describe a body part or approach value or making changes to the Substance and Device Keys. We would use our established process to implement an April 1 code update, which would include presenting proposals for April 1 consideration at the September ICD–10 Coordination and Maintenance Committee meeting, requesting public comments, reviewing the public comments, finalizing codes, and announcing the new codes with their assignments consistent with the new GROUPER release information. Under our contemplated process, requestors would indicate whether they are submitting their code request for consideration for an April 1 implementation date, if adopted, or an October 1 implementation date. The ICD–10 Coordination and Maintenance Committee would make efforts to accommodate the requested implementation date for each request submitted. However, the Committee would determine which requests would be presented for consideration for an April 1 implementation date or an October 1 implementation date. We refer the reader to the Agenda packet from the meeting at: *https://www.cms.gov/Medicare/Coding/ICD10/C-and-M-Meeting-Materials* for additional information regarding this announcement and our request for comments.

If this new April 1 implementation date is adopted, we would assign the codes approved for the April 1 update to an MS–DRG(s) using our established process for GROUPER assignments for new diagnosis and procedure codes. Specifically, consistent with our established process for assigning new diagnosis and procedure codes, we would review the predecessor code and MS–DRG assignment most closely associated with the new diagnosis or procedure code, and in the absence of claims data, we would consider other factors that may be relevant to the MS–DRG assignment, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the condition. We note that this process would not automatically result in the new diagnosis or procedure code being assigned to the same MS–DRG or having the same designation as the predecessor code.

ICD–9–CM addendum and code title information is published on the CMS website at: *http://www.cms.hhs.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/index.html?redirect=/icd9ProviderDiagnosticCodes/01overview.asp#TopofPage*. ICD–10–CM and ICD–10–PCS addendum and code title information is published on the CMS website at: *http://www.cms.gov/Medicare/Coding/ICD10/index.html*. CMS also sends electronic files containing all ICD–10–CM and ICD–10–PCS coding changes to its Medicare contractors for use in updating their systems and providing education to providers.

Information on ICD–10–CM diagnosis codes, along with the Official ICD–10–CM Coding Guidelines, can be found on the CDC website at: *https://www.cdc.gov/nchs/icd/icd10cm.htm.*

Additionally, information on new, revised, and deleted ICD–10–CM diagnosis and ICD–10–PCS procedure codes is provided to the AHA for publication in the *Coding Clinic for ICD–10.* The AHA also distributes coding update information to publishers and software vendors.

For FY 2021, there are currently 72,621 diagnosis codes and 78,136 ICD–10–PCS procedure codes. As displayed in Table 6A.—New Diagnosis Codes and in Table 6B.—New Procedure Codes associated with this proposed rule (and available via the internet on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index/,* there are 147 new diagnosis codes and 106 new procedure codes that have been finalized for FY 2022 at the time of the development of this proposed rule. The code titles are adopted as part of the ICD–10 Coordination and Maintenance Committee process. Thus, although we publish the code titles in the IPPS proposed and final rules, they are not subject to comment in the proposed or final rules. We will continue to provide the October updates in this manner in the IPPS proposed and final rules.

17. Replaced Devices Offered Without Cost or With a Credit

a. Background

In the FY 2008 IPPS final rule with comment period (72 FR 47246 through 47251), we discussed the topic of Medicare payment for devices that are replaced without cost or where credit for a replaced device is furnished to the hospital. We implemented a policy to reduce a hospital's IPPS payment for certain MS–DRGs where the implantation of a device that subsequently failed or was recalled determined the base MS–DRG assignment. At that time, we specified that we will reduce a hospital's IPPS payment for those MS–DRGs where the hospital received a credit for a replaced device equal to 50 percent or more of the cost of the device.

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51556 through 51557), we clarified this policy to state that the policy applies if the hospital received a credit equal to 50 percent or more of the cost of the replacement device and issued instructions to hospitals accordingly.

b. Proposed Changes for FY 2022

For FY 2022 we are proposing not to add any MS–DRGs to the policy for replaced devices offered without cost or with a credit. We are proposing to continue to include the existing MS–DRGs currently subject to the policy as displayed in the following table.

BILLING CODE 4120–01–P

MDC	MS-DRG	MS-DRG Title
Pre-MDC	001	Heart Transplant or Implant of Heart Assist System with MCC
Pre-MDC	002	Heart Transplant or Implant of Heart Assist System without MCC
01	023	Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator
01	024	Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis without MCC
01	025	Craniotomy and Endovascular Intracranial Procedures with MCC
01	026	Craniotomy and Endovascular Intracranial Procedures with CC
01	027	Craniotomy and Endovascular Intracranial Procedures without CC/MCC
01	040	Peripheral, Cranial Nerve and Other Nervous System Procedures with MCC
01	041	Peripheral, Cranial Nerve and Other Nervous System Procedures with CC or Peripheral Neurostimulator
01	042	Peripheral, Cranial Nerve and Other Nervous System Procedures without CC/MCC
03	140	Major Head and Neck Procedures with MCC
03	141	Major Head and Neck Procedures with CC
03	142	Major Head and Neck Procedures without CC/MCC
05	215	Other Heart Assist System Implant
05	216	Cardiac Valve and Other Major Cardiothoracic Procedure with Cardiac Catheterization with MCC
05	217	Cardiac Valve and Other Major Cardiothoracic Procedure with Cardiac Catheterization with CC
05	218	Cardiac Valve and Other Major Cardiothoracic Procedure with Cardiac Catheterization without CC/MCC
05	219	Cardiac Valve and Other Major Cardiothoracic Procedure without Cardiac Catheterization with MCC
05	220	Cardiac Valve and Other Major Cardiothoracic Procedure without Cardiac Catheterization with CC
05	221	Cardiac Valve and Other Major Cardiothoracic Procedure without Cardiac Catheterization without CC/MCC
05	222	Cardiac Defibrillator Implant with Cardiac Catheterization with AMI/Heart Failure/Shock with MCC
05	223	Cardiac Defibrillator Implant with Cardiac Catheterization with AMI/Heart Failure/Shock without MCC
05	224	Cardiac Defibrillator Implant with Cardiac Catheterization without AMI/Heart Failure/Shock with MCC
05	225	Cardiac Defibrillator Implant with Cardiac Catheterization without AMI/Heart Failure/Shock without MCC
05	226	Cardiac Defibrillator Implant without Cardiac Catheterization with MCC
05	227	Cardiac Defibrillator Implant without Cardiac Catheterization without MCC
05	242	Permanent Cardiac Pacemaker Implant with MCC
05	243	Permanent Cardiac Pacemaker Implant with CC
05	244	Permanent Cardiac Pacemaker Implant without CC/MCC

MDC	MS-DRG	MS-DRG Title
05	245	AICD Generator Procedures
05	258	Cardiac Pacemaker Device Replacement with MCC
05	259	Cardiac Pacemaker Device Replacement without MCC
05	260	Cardiac Pacemaker Revision Except Device Replacement with MCC
05	261	Cardiac Pacemaker Revision Except Device Replacement with CC
05	262	Cardiac Pacemaker Revision Except Device Replacement without CC/MCC
05	265	AICD Lead Procedures
05	266	Endovascular Cardiac Valve Replacement And Supplement Procedures with MCC
05	267	Endovascular Cardiac Valve Replacement And Supplement Procedures without MCC
05	268	Aortic and Heart Assist Procedures Except Pulsation Balloon with MCC
05	269	Aortic and Heart Assist Procedures Except Pulsation Balloon without MCC
05	270	Other Major Cardiovascular Procedures with MCC
05	271	Other Major Cardiovascular Procedures with CC
05	272	Other Major Cardiovascular Procedures without CC/MCC
05	319	Other Endovascular Cardiac Valve Procedures with MCC
05	320	Other Endovascular Cardiac Valve Procedures without MCC
08	461	Bilateral or Multiple Major Joint Procedures Of Lower Extremity with MCC
08	462	Bilateral or Multiple Major Joint Procedures of Lower Extremity without MCC
08	466	Revision of Hip or Knee Replacement with MCC
08	467	Revision of Hip or Knee Replacement with CC
08	468	Revision of Hip or Knee Replacement without CC/MCC
08	469	Major Hip and Knee Joint Replacement or Reattachment of Lower Extremity with MCC or Total Ankle Replacement
08	470	Major Hip and Knee Joint Replacement or Reattachment of Lower Extremity without MCC
08	551	Hip Replacement with Principal Diagnosis of Hip Fracture with MCC
08	552	Hip Replacement with Principal Diagnosis of Hip Fracture without MCC

BILLING CODE 4120–01–C

The final list of MS–DRGs subject to the IPPS policy for replaced devices offered without cost or with a credit will be included in the FY 2022 IPPS/LTCH PPS final rule and also will be issued to providers in the form of a Change Request (CR).

II. Proposed Changes to Medicare Severity Diagnosis-Related Group (MS–DRG) Classifications and Relative Weights

E. Recalibration of the FY 2022 MS–DRG Relative Weights

1. Data Sources for Developing the Relative Weights

In accordance with our proposal as discussed in section I.F. of this proposed rule, for the purposes of establishing the FY 2022 MS–DRG relative weights, we are proposing to use the FY 2019 MedPAR claims data, based on claims received by CMS through March 31, 2020, and the March 2020 update of the FY 2018 HCRIS file where we ordinarily would have used the FY 2020 MedPAR claims data, based on claims received by CMS through December 31, 2020, and the December 2020 update of the FY 2019 HCRIS file. We refer the reader to section I.F. of this

proposed rule for further discussion of our analysis of the best available data for purposes of the FY 2022 ratesetting and our related proposals.

Consistent with our established policy, in developing the MS–DRG relative weights for FY 2022, we are proposing to use two data sources: Claims data and cost report data. The claims data source is the MedPAR file, which includes fully coded diagnostic and procedure data for all Medicare inpatient hospital bills. The FY 2019 MedPAR data used in this proposed rule include discharges occurring on October 1, 2018, through September 30, 2019, based on bills received by CMS through March 31, 2020, from all hospitals subject to the IPPS and short-term, acute care hospitals in Maryland (which at that time were under a waiver from the IPPS).

The FY 2019 MedPAR file used in calculating the proposed relative weights includes data for approximately 9,217,828 Medicare discharges from IPPS providers. Discharges for Medicare beneficiaries enrolled in a Medicare Advantage managed care plan are excluded from this analysis. These discharges are excluded when the MedPAR ''GHO Paid'' indicator field on the claim record is equal to ''1'' or when the MedPAR DRG payment field, which represents the total payment for the claim, is equal to the MedPAR ''Indirect Medical Education (IME)'' payment field, indicating that the claim was an ''IME only'' claim submitted by a teaching hospital on behalf of a beneficiary enrolled in a Medicare Advantage managed care plan. In addition, the March 31, 2020 update of the FY 2019 MedPAR file complies with version 5010 of the X12 HIPAA Transaction and Code Set Standards, and includes a variable called ''claim type.'' Claim type ''60'' indicates that the claim was an inpatient claim paid as fee-for-service. Claim types ''61,'' ''62,'' ''63,'' and ''64'' relate to encounter claims, Medicare Advantage IME claims, and HMO no-pay claims. Therefore, the calculation of the proposed relative weights for FY 2022 also excludes claims with claim type values not equal to ''60.'' The data exclude CAHs, including hospitals that subsequently became CAHs after the period from which the data were taken. We note that the proposed FY 2022 relative weights are based on the ICD–10–CM diagnosis codes and ICD–10–PCS procedure codes from the FY 2019 MedPAR claims data, grouped through the ICD–10 version of the proposed FY 2022 GROUPER (Version 39).

The second data source used in the cost-based relative weighting methodology is the Medicare cost report data files from the HCRIS. Normally, we use the HCRIS dataset that is 3 years prior to the IPPS fiscal year. However, as discussed earlier in this section, we are proposing to use the March 31, 2020 update of the FY 2018 HCRIS for calculating the proposed FY 2022 cost-based relative weights. Consistent with our historical practice, for this FY 2022 proposed rule, we are providing the version of the HCRIS from which we calculated these proposed 19 CCRs on the CMS website at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. Click on the link on the left side of the screen titled ''FY 2022 IPPS Proposed Rule Home Page'' or ''Acute Inpatient Files for Download.'' We note that this file is identical to the file used for the FY 2021 IPPS/LTCH PPS final rule. As discussed previously, we are also making available the FY 2019 HCRIS and the FY 2020 MedPAR file as well as other related information and data files for purposes of public comment on our alternative approach of using the same FY 2020 data that we would ordinarily use for purposes of FY 2022 ratesetting.

2. Methodology for Calculation of the Relative Weights

a. General

We calculated the proposed FY 2022 relative weights based on 19 CCRs, as we did for FY 2021. The methodology we are proposing to use to calculate the FY 2022 MS–DRG cost-based relative weights based on claims data in the FY 2019 MedPAR file and data from the FY 2018 Medicare cost reports is as follows:

- To the extent possible, all the claims were regrouped using the proposed FY 2022 MS–DRG classifications discussed in sections II.B. and II.F. of the preamble of this proposed rule.
- The transplant cases that were used to establish the relative weights for heart and heart-lung, liver and/or intestinal, and lung transplants (MS–DRGs 001, 002, 005, 006, and 007, respectively) were limited to those Medicare-approved transplant centers that have cases in the FY 2019 MedPAR file. (Medicare coverage for heart, heart-lung, liver and/or intestinal, and lung transplants is limited to those facilities that have received approval from CMS as transplant centers.)
- Organ acquisition costs for kidney, heart, heart-lung, liver, lung, pancreas, and intestinal (or multivisceral organs) transplants continue to be paid on a reasonable cost basis.

Because these acquisition costs are paid separately from the prospective payment rate, it is necessary to subtract the acquisition charges from the total charges on each transplant bill that showed acquisition charges before computing the average cost for each MS–DRG and before eliminating statistical outliers.

Section 108 of the Further Consolidated Appropriations Act, 2020 provides that, for cost reporting periods beginning on or after October 1, 2020, costs related to hematopoietic stem cell acquisition for the purpose of an allogeneic hematopoietic stem cell transplant shall be paid on a reasonable cost basis. We refer the reader to the FY 2021 IPPS/LTCH PPS final rule for further discussion of the reasonable cost basis payment for cost reporting periods beginning on or after October 1, 2020 (85 FR 58835 to 58842). For FY 2022 and subsequent years, we are proposing to subtract the hematopoietic stem cell acquisition charges from the total charges on each transplant bill that showed hematopoietic stem cell acquisition charges before computing the average cost for each MS–DRG and before eliminating statistical outliers.

- Claims with total charges or total lengths of stay less than or equal to zero were deleted. Claims that had an amount in the total charge field that differed by more than $30.00 from the sum of the routine day charges, intensive care charges, pharmacy charges, implantable devices charges, supplies and equipment charges, therapy services charges, operating room charges, cardiology charges, laboratory charges, radiology charges, other service charges, labor and delivery charges, inhalation therapy charges, emergency room charges, blood and blood products charges, anesthesia charges, cardiac catheterization charges, CT scan charges, and MRI charges were also deleted.
- At least 92.8 percent of the providers in the MedPAR file had charges for 14 of the 19 cost centers. All claims of providers that did not have charges greater than zero for at least 14 of the 19 cost centers were deleted. In other words, a provider must have no more than five blank cost centers. If a provider did not have charges greater than zero in more than five cost centers, the claims for the provider were deleted.
- Statistical outliers were eliminated by removing all cases that were beyond 3.0 standard deviations from the geometric mean of the log distribution of both the total charges per case and the total charges per day for each MS–DRG.

• Effective October 1, 2008, because hospital inpatient claims include a POA indicator field for each diagnosis present on the claim, only for purposes of relative weight-setting, the POA indicator field was reset to ''Y'' for ''Yes'' for all claims that otherwise have an ''N'' (No) or a ''U'' (documentation insufficient to determine if the condition was present at the time of inpatient admission) in the POA field.

Under current payment policy, the presence of specific HAC codes, as indicated by the POA field values, can generate a lower payment for the claim. Specifically, if the particular condition is present on admission (that is, a ''Y'' indicator is associated with the diagnosis on the claim), it is not a HAC, and the hospital is paid for the higher severity (and, therefore, the higher weighted MS–DRG). If the particular condition is not present on admission (that is, an ''N'' indicator is associated with the diagnosis on the claim) and there are no other complicating conditions, the DRG GROUPER assigns the claim to a lower severity (and, therefore, the lower weighted MS–DRG) as a penalty for allowing a Medicare inpatient to contract a HAC. While the POA reporting meets policy goals of encouraging quality care and generates program savings, it presents an issue for the relative weight-setting process. Because cases identified as HACs are likely to be more complex than similar cases that are not identified as HACs, the charges associated with HAC cases are likely to be higher as well. Therefore, if the higher charges of these HAC claims are grouped into lower severity MS–DRGs prior to the relative weight-setting process, the relative weights of these particular MS–DRGs would become artificially inflated, potentially skewing the relative weights. In addition, we want to protect the integrity of the budget neutrality process by ensuring that, in estimating payments, no increase to the standardized amount occurs as a result of lower overall payments in a previous year that stem from using weights and case-mix that are based on lower severity MS–DRG assignments. If this would occur, the anticipated cost savings from the HAC policy would be lost.

To avoid these problems, we reset the POA indicator field to ''Y'' only for relative weight-setting purposes for all claims that otherwise have an ''N'' or a ''U'' in the POA field. This resetting ''forced'' the more costly HAC claims into the higher severity MS–DRGs as appropriate, and the relative weights calculated for each MS–DRG more closely reflect the true costs of those cases.

In addition, in the FY 2013 IPPS/LTCH PPS final rule, for FY 2013 and subsequent fiscal years, we finalized a policy to treat hospitals that participate in the Bundled Payments for Care Improvement (BPCI) initiative the same as prior fiscal years for the IPPS payment modeling and ratesetting process without regard to hospitals' participation within these bundled payment models (77 FR 53341 through 53343). Specifically, because acute care hospitals participating in the BPCI Initiative still receive IPPS payments under section 1886(d) of the Act, we include all applicable data from these subsection (d) hospitals in our IPPS payment modeling and ratesetting calculations as if the hospitals were not participating in those models under the BPCI initiative. We refer readers to the FY 2013 IPPS/LTCH PPS final rule for a complete discussion on our final policy for the treatment of hospitals participating in the BPCI initiative in our ratesetting process. For additional information on the BPCI initiative, we refer readers to the CMS' Center for Medicare and Medicaid Innovation's website at: *http://innovation.cms.gov/initiatives/Bundled-Payments/index.html* and to section IV.H.4. of the preamble of the FY 2013 IPPS/LTCH PPS final rule (77 FR 53341 through 53343).

The participation of hospitals in the BPCI initiative concluded on September 30, 2018. The participation of hospitals in the BPCI Advanced model started on October 1, 2018. The BPCI Advanced model, tested under the authority of section 1115A of the Act, is comprised of a single payment and risk track, which bundles payments for multiple services beneficiaries receive during a Clinical Episode. Acute care hospitals may participate in BPCI Advanced in one of two capacities: As a model Participant or as a downstream Episode Initiator. Regardless of the capacity in which they participate in the BPCI Advanced model, participating acute care hospitals will continue to receive IPPS payments under section 1886(d) of the Act. Acute care hospitals that are Participants also assume financial and quality performance accountability for Clinical Episodes in the form of a reconciliation payment. For additional information on the BPCI Advanced model, we refer readers to the BPCI Advanced web page on the CMS Center for Medicare and Medicaid Innovation's website at: *https://innovation.cms.gov/initiatives/bpci-advanced/*. Consistent with our policy for FY 2021, and consistent with how we have treated hospitals that participated in the BPCI Initiative, for FY 2022, we continue to believe it is appropriate to include all applicable data from the subsection (d) hospitals participating in the BPCI Advanced model in our IPPS payment modeling and ratesetting calculations because, as noted previously, these hospitals are still receiving IPPS payments under section 1886(d) of the Act. Consistent with the FY 2021 IPPS/LTCH PPS final rule, we are also proposing to include all applicable data from subsection (d) hospitals participating in the Comprehensive Care for Joint Replacement (CJR) Model in our IPPS payment modeling and ratesetting calculations. The charges for each of the 19 cost groups for each claim were standardized to remove the effects of differences in area wage levels, IME and DSH payments, and for hospitals located in Alaska and Hawaii, the applicable cost-of-living adjustment. Because hospital charges include charges for both operating and capital costs, we standardized total charges to remove the effects of differences in geographic adjustment factors, cost-of-living adjustments, and DSH payments under the capital IPPS as well. Charges were then summed by MS–DRG for each of the 19 cost groups so that each MS–DRG had 19 standardized charge totals. Statistical outliers were then removed. These charges were then adjusted to cost by applying the proposed national average CCRs developed from the FY 2018 cost report data, consistent with our proposed FY 2022 ratesetting discussed in section II.A.4 of the Addendum of this proposed rule.

The 19 cost centers that we used in the proposed relative weight calculation are shown in a supplemental data file, Cost Center HCRIS Lines Supplemental Data File, posted via the internet on the CMS website for this proposed rule and available at *http://www.cms.hhs.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. The supplemental data file shows the lines on the cost report and the corresponding revenue codes that we used to create the proposed 19 national cost center CCRs. If we receive comments about the groupings in this supplemental data file, we may consider these comments as we finalize our policy.

Consistent with historical practice, we account for rare situations of non-monotonicity in a base MS–DRG and its severity levels, where the mean cost in the higher severity level is less than the mean cost in the lower severity level, in determining the relative weights for the different severity levels. If there are initially non-monotonic relative weights

in the same base DRG and its severity levels, then we combine the cases that group to the specific non-monotonic MS–DRGs for purposes of relative weight calculations. For example, if there are two non-monotonic MS–DRGs, combining the cases across those two MS–DRGs results in the same relative weight for both MS–DRGs. The relative weight calculated using the combined cases for those severity levels is monotonic, effectively removing any non-monotonicity with the base DRG and its severity levels. For this FY 2022 proposed rule, this calculation was applied to address non-monotonicity for cases that grouped to MS–DRG 504 and MS–DRG 505. We note that cases were also combined in calculating the relative weights for these two MS–DRGs for FY 2021. In the supplemental file titled AOR/BOR File, we include statistics for the affected MS–DRGs both separately and with cases combined.

We are inviting public comments on our proposals related to recalibration of the proposed FY 2022 relative weights and the changes in relative weights from FY 2021.

b. Relative Weight Calculation for MS–DRG 018

As discussed in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58599 through 58600), we created MS–DRG 018 for cases that include procedures describing CAR T-cell therapies, which were reported using ICD–10–PCS procedure codes XW033C3 or XW043C3. We refer the reader to section II.D.2. of this proposed rule for discussion of the procedure codes for CAR T-cell and non-CAR T-cell therapies and other immunotherapies that we are proposing for assignment to MS–DRG 018 for FY 2022.

In the FY 2021 IPPS/LTCH PPS final rule, we finalized our proposals to modify our existing relative weight methodology to ensure that the relative weight for new MS–DRG 018 appropriately reflects the relative resources required for providing CAR T-cell therapy outside of a clinical trial, while still accounting for the clinical trial cases in the overall average cost for all MS–DRGs, with additional refinements in response to comments. For cases that group to MS–DRG 018, we finalized to not include claims determined to be clinical trial claims that group to new MS–DRG 018 when calculating the average cost for new MS–DRG 018 that is used to calculate the relative weight for this MS–DRG, with the additional refinements that (a) when the CAR T-cell therapy product is purchased in the usual manner, but the case involves a clinical trial of a different product, the claim will be included when calculating the average cost for new MS–DRG 018 to the extent such claims can be identified in the historical data, and (b) when there is expanded access use of immunotherapy, these cases will not be included when calculating the average cost for new MS–DRG 018 to the extent such claims can be identified in the historical data (85 FR 58600). We also finalized our proposal to calculate an adjustment to account for the CAR T-cell therapy cases determined to be clinical trial cases, as described in the FY 2021 IPPS/LTCH PPS final rule, with the additional refinement of including revenue center 891 in our calculation of standardized drug charges for MS–DRG 018. Applying this finalized methodology, based on the March 2020 update of the FY 2019 MedPAR file for the FY 2021 IPPS/LTCH PPS final rule, we estimated that the average costs of CAR T-cell therapy cases determined to be clinical trial cases ($46,062) were 17 percent of the average costs of CAR T cell therapy cases determined to be non-clinical trial cases ($276,042), and therefore, in calculating the national average cost per case for purposes of the FY 2021 IPPS/LTCH PPS final rule, each case identified as a clinical trial case was adjusted by 0.17. We also noted that we were applying this adjustor for cases determined to be CAR T-cell therapy clinical trial cases for purposes of budget neutrality and outlier simulations. We refer the reader to the FY 2021 IPPS/LTCH PPS final rule for complete discussion of our finalized modifications to the relative weight calculation for MS–DRG 018.

Since we are proposing to use the same FY 2019 MedPAR claims data for FY 2022 ratesetting that we did for the FY 2021 final rule, we are also proposing to continue to use the same process to identify clinical trial claims in the FY 2019 MedPAR for purposes of calculating the FY 2022 relative weights. We continue to use the proxy of standardized drug charges of less than $373,000, which was the average sales price of KYMRIAH and YESCARTA, which are the two CAR T-cell biological products in the MedPAR data used for the FY 2021 final rule and this proposed rule. Using the same methodology from the FY 2021 IPPS/LTCH PPS final rule, we are proposing to apply an adjustment to account for the CAR T cell therapy cases identified as clinical trial cases in calculating the national average standardized cost per case that is used to calculate the relative weights for all MS–DRGs:

- Calculate the average cost for cases to be assigned to new MS–DRG 018 that contain ICD–10–CM diagnosis code Z00.6 or contain standardized drug charges of less than $373,000.
- Calculate the average cost for cases to be assigned to new MS–DRG 018 that do not contain ICD–10–CM diagnosis code Z00.6 or standardized drug charges of at least $373,000.
- Calculate an adjustor by dividing the average cost calculated in step 1 by the average cost calculated in step 2.
- Apply the adjustor calculated in step 3 to the cases identified in step 1 as clinical trial cases, then add this adjusted case count to the non-clinical trial case count prior to calculating the average cost across all MS–DRGs.

Additionally, we are continuing our finalized methodology for calculating this payment adjustment, such that: (a) When the CAR T-cell therapy product is purchased in the usual manner, but the case involves a clinical trial of a different product, the claim will be included when calculating the average cost for cases not determined to be clinical trial cases and (b) when there is expanded access use of immunotherapy, these cases will be included when calculating the average cost for cases determined to be clinical trial cases. However, we continue to believe to the best of our knowledge there are no claims in the historical data (FY 2019 MedPAR) used in the calculation of the adjustment for cases involving a clinical trial of a different product, and to the extent the historical data contain claims for cases involving expanded access use of immunotherapy we believe those claims would have drug charges less than $373,000. Consistent with our proposal to use the FY 2019 data for the FY 2022 ratesetting, we are also proposing to calculate this adjustor based on the March 2020 update of the FY 2019 MedPAR file for purposes of establishing the FY 2022 relative weights. Accordingly, as we did for FY 2021, we are proposing to adjust the transfer-adjusted case count for MS–DRG 018 by applying the proposed adjustor of 17 percent to the applicable clinical trial cases, and to use this adjusted case count for MS–DRG 018 in calculating the national average cost per case, which is used in the calculation of the relative weights. Therefore, in calculating the national average cost per case for purposes of this proposed rule, each case identified as a clinical trial case was adjusted by 17 percent. As we did for FY 2021, we are proposing to apply this same adjustor for the applicable cases that group to MS–DRG 018 for purposes of budget neutrality and outlier simulations.

As discussed in section I.F. of this proposed rule, we are also soliciting

comments on an alternative approach of using the same FY 2020 data that we would ordinarily use for purposes of the FY 2022 rulemaking, which we may consider finalizing for FY 2022 based on consideration of comments received. We note that using the methodology as finalized in the FY 2021 IPPS/LTCH PPS final rule, we calculated an adjustor of 0.25 based on this alternative approach of using the FY 2020 MedPAR file.

3. Development of Proposed National Average CCRs

Consistent with our proposal to use the FY 2019 data for the FY 2022 ratesetting, as discussed earlier in this section, we are proposing to continue to use the national average CCRs that were calculated for the FY 2021 final rule using that same data. Specifically, we calculated these national average CCRs as follows:

Using the FY 2018 cost report data, we removed CAHs, Indian Health Service hospitals, all-inclusive rate hospitals, and cost reports that represented time periods of less than 1 year (365 days). We included hospitals located in Maryland because we include their charges in our claims database. Then we created CCRs for each provider for each cost center (see the supplemental data file for line items used in the calculations) and removed any CCRs that were greater than 10 or less than 0.01. We normalized the departmental CCRs by dividing the CCR for each department by the total CCR for the hospital for the purpose of trimming the data. Then we took the logs of the normalized cost center CCRs and removed any cost center CCRs where the log of the cost center CCR was greater or less than the mean log plus/minus 3 times the standard deviation for the log of that cost center CCR. Once the cost report data were trimmed, we calculated a Medicare-specific CCR. The Medicare-specific CCR was determined by taking the Medicare charges for each line item from Worksheet D–3 and deriving the Medicare-specific costs by applying the hospital-specific departmental CCRs to the Medicare-specific charges for each line item from Worksheet D–3. Once each hospital's Medicare-specific costs were established, we summed the total Medicare-specific costs and divided by the sum of the total Medicare-specific charges to produce national average, charge-weighted CCRs.

After we multiplied the total charges for each MS–DRG in each of the 19 cost centers by the corresponding national average CCR, we summed the 19 ''costs'' across each MS–DRG to produce a total standardized cost for the MS–DRG. The average standardized cost for each MS–DRG was then computed as the total standardized cost for the MS–DRG divided by the transfer-adjusted case count for the MS–DRG. The average cost for each MS–DRG was then divided by the national average standardized cost per case to determine the proposed relative weight.

The proposed FY 2022 cost-based relative weights were then normalized by an adjustment factor of 1.820783 so that the average case weight after recalibration was equal to the average case weight before recalibration. The normalization adjustment is intended to ensure that recalibration by itself neither increases nor decreases total payments under the IPPS, as required by section 1886(d)(4)(C)(iii) of the Act.

The proposed 19 national average CCRs for FY 2022 are as follows:

Group	CCR
Routine Days	0.421
Intensive Days	0.344
Drugs	0.187
Supplies & Equipment	0.297
Implantable Devices	0.293
Inhalation Therapy	0.147
Therapy Services	0.288
Anesthesia	0.071
Labor & Delivery	0.359

Group	CCR
Operating Room	0.167
Cardiology	0.094
Cardiac Catheterization	0.1
Laboratory	0.107
Radiology	0.136
MRIs	0.07
CT Scans	0.034
Emergency Room	0.147
Blood and Blood Products	0.271
Other Services	0.343

Since FY 2009, the relative weights have been based on 100 percent cost weights based on our MS–DRG grouping system.

When we recalibrated the DRG weights for previous years, we set a threshold of 10 cases as the minimum number of cases required to compute a reasonable weight. We are proposing to use that same case threshold in recalibrating the proposed MS–DRG relative weights for FY 2022. Using data from the FY 2019 MedPAR file, there were 7 MS–DRGs that contain fewer than 10 cases. For FY 2022, because we do not have sufficient MedPAR data to set accurate and stable cost relative weights for these low-volume MS–DRGs, we are proposing to compute relative weights for the low-volume MS–DRGs by adjusting their final FY 2021 relative weights by the percentage change in the average weight of the cases in other MS–DRGs from FY 2021 to FY 2022. The crosswalk table is as follows.

Low-Volume MS-DRG	MS-DRG Title	Crosswalk to MS-DRG
789	Neonates, Died or Transferred to Another Acute Care Facility	Final FY 2021 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
790	Extreme Immaturity or Respiratory Distress Syndrome, Neonate	Final FY 2021 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
791	Prematurity with Major Problems	Final FY 2021 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
792	Prematurity without Major Problems	Final FY 2021 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
793	Full-Term Neonate with Major Problems	Final FY 2021 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
794	Neonate with Other Significant Problems	Final FY 2021relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
795	Normal Newborn	Final FY 2021 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)

F. Add-On Payments for New Services and Technologies for FY 2022

1. Background

Sections 1886(d)(5)(K) and (L) of the Act establish a process of identifying and ensuring adequate payment for new medical services and technologies (sometimes collectively referred to in this section as ''new technologies'') under the IPPS. Section 1886(d)(5)(K)(vi) of the Act specifies that a medical service or technology will be considered new if it meets criteria established by the Secretary after notice and opportunity for public comment. Section 1886(d)(5)(K)(ii)(I) of the Act specifies that a new medical service or technology may be considered for new technology add-on payment if, based on the estimated costs incurred with respect to discharges involving such service or technology, the DRG prospective payment rate otherwise applicable to such discharges under this subsection is inadequate. We note that, beginning with discharges occurring in FY 2008, CMS transitioned from CMS–DRGs to MS–DRGs. The regulations at 42 CFR 412.87 implement these provisions and 42 CFR 412.87(b) specifies three criteria for a new medical service or technology to receive the additional payment: (1) The medical service or technology must be new; (2) the medical service or technology must be costly such that the DRG rate otherwise applicable to discharges involving the medical service or technology is determined to be inadequate; and (3) the service or technology must demonstrate a substantial clinical improvement over existing services or technologies. In addition, certain transformative new devices and antimicrobial products may qualify under an alternative inpatient new technology add-on payment pathway, as set forth in the regulations at § 412.87(c) and (d). We note that section 1886(d)(5)(K)(i) of the Act requires that the Secretary establish a mechanism to recognize the costs of new medical services and technologies under the payment system established under that subsection, which establishes the system for paying for the operating costs of inpatient hospital services. The system of payment for capital costs is established under section 1886(g) of the Act. Therefore, as discussed in prior rulemaking (72 FR 47307 through 47308), we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add-on payments under the IPPS for capital-related costs. In this rule, we highlight some of the major statutory and regulatory provisions relevant to the new technology add-on payment criteria, as well as other information. For a complete discussion of the new technology add-on payment criteria, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51572 through 51574), FY 2020 IPPS/LTCH PPS final rule (84 FR 42288 through 42300) and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58736 through 58742).

a. New Technology Add On Payment Criteria

(1) Newness Criterion

Under the first criterion, as reflected in § 412.87(b)(2), a specific medical service or technology will no longer be considered ''new'' for purposes of new medical service or technology add-on payments after CMS has recalibrated the MS–DRGs, based on available data, to reflect the cost of the technology. We note that we do not consider a service or technology to be new if it is substantially similar to one or more existing technologies. That is, even if a medical product receives a new FDA approval or clearance, it may not necessarily be considered ''new'' for purposes of new technology add-on payments if it is ''substantially similar'' to another medical product that was approved or cleared by FDA and has been on the market for more than 2 to 3 years. In the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43813 through 43814), we established criteria for evaluating whether a new technology is substantially similar to an existing technology, specifically: (1)

Whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome; (2) whether a product is assigned to the same or a different MS–DRG; and (3) whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population. If a technology meets all three of these criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments. For a detailed discussion of the criteria for substantial similarity, we refer readers to the FY 2006 IPPS final rule (70 FR 47351 through 47352) and the FY 2010 IPPS/LTCH PPS final rule (74 FR 43813 through 43814).

(2) Cost Criterion

Under the second criterion, § 412.87(b)(3) further provides that, to be eligible for the add-on payment for new medical services or technologies, the MS–DRG prospective payment rate otherwise applicable to discharges involving the new medical service or technology must be assessed for adequacy. Under the cost criterion, consistent with the formula specified in section 1886(d)(5)(K)(ii)(I) of the Act, to assess the adequacy of payment for a new technology paid under the applicable MS–DRG prospective payment rate, we evaluate whether the charges of the cases involving a new medical service or technology will exceed a threshold amount that is the lesser of 75 percent of the standardized amount (increased to reflect the difference between cost and charges) or 75 percent of one standard deviation beyond the geometric mean standardized charge for all cases in the MS–DRG to which the new medical service or technology is assigned (or the case-weighted average of all relevant MS–DRGs if the new medical service or technology occurs in many different MS–DRGs). The MS–DRG threshold amounts generally used in evaluating new technology add-on payment applications for FY 2022 are presented in a data file that is available, along with the other data files associated with the FY 2021 IPPS/LTCH PPS final rule and correction notice, on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*.

We note that, under the policy finalized in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58603 through 58605), beginning with FY 2022, we use the proposed threshold values associated with the proposed rule for that fiscal year to evaluate the cost criterion for all applications for new technology add-on payments and previously approved technologies that may continue to receive new technology add-on payments, if those technologies would be assigned to a proposed new MS–DRG for that same fiscal year.

As finalized in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41275), beginning with FY 2020, we include the thresholds applicable to the next fiscal year (previously included in Table 10 of the annual IPPS/LTCH PPS proposed and final rules) in the data files associated with the prior fiscal year. Accordingly, the proposed thresholds for applications for new technology add-on payments for FY 2023 are presented in a data file that is available on the CMS website, along with the other data files associated with this FY 2022 proposed rule, by clicking on the FY 2022 IPPS Proposed Rule Home Page at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*. We note, for the reasons discussed in section I.F of the preamble of this proposed rule, we are proposing to use the FY 2019 MedPAR claims data where we ordinarily would have used the FY 2020 MedPAR claims data for purposes of proposed FY 2022 ratesetting. We refer the reader to section I.F. of the preamble of this proposed rule for further discussion of our analysis of the best available data for FY 2022 ratesetting and our related proposals. For the FY 2023 proposed threshold values, consistent with our proposal, we are proposing to use FY 2019 claims data to evaluate whether the charges of the cases involving a new medical service or technology will exceed a threshold amount that is the lesser of 75 percent of the proposed FY 2022 standardized amount (increased to reflect the difference between cost and charges) or 75 percent of one standard deviation beyond the geometric mean standardized charge (using FY 2019 claims data) for all cases in the MS–DRG (using FY 2019 claims data) to which the new medical service or technology is assigned (or the case-weighted average of all relevant MS–DRGs if the new medical service or technology occurs in many different MS–DRGs), rather than the FY 2020 data we would otherwise use. As discussed in section I.F of the preamble of this proposed rule, we are also considering, as an alternative to our proposal, the use of the same FY 2020 data that we would ordinarily use for purposes of FY 2022 ratesetting. If we were to finalize this alternative approach for FY 2022, we would use the FY 2020 claims data for purposes of the final thresholds for applications for new technology add-on payments for FY 2023 in the FY 2022 IPPS/LTCH PPS final rule. We are making available the threshold values calculated using the FY 2020 claims data at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*. In the September 7, 2001 final rule that established the new technology add-on payment regulations (66 FR 46917), we discussed that applicants should submit a significant sample of data to demonstrate that the medical service or technology meets the high-cost threshold. Specifically, applicants should submit a sample of sufficient size to enable us to undertake an initial validation and analysis of the data. We also discussed in the September 7, 2001 final rule (66 FR 46917) the issue of whether the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule at 45 CFR parts 160 and 164 applies to claims information that providers submit with applications for new medical service or technology add-on payments. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51573) for complete information on this issue.

(3) Substantial Clinical Improvement Criterion

Under the third criterion at § 412.87(b)(1), a medical service or technology must represent an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42288 through 42292), we prospectively codified in our regulations at § 412.87(b) the following aspects of how we evaluate substantial clinical improvement for purposes of new technology add-on payments under the IPPS:

- The totality of the circumstances is considered when making a determination that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries.
- A determination that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries means—

++ The new medical service or technology offers a treatment option for a patient population unresponsive to, or

ineligible for, currently available treatments;

++ The new medical service or technology offers the ability to diagnose a medical condition in a patient population where that medical condition is currently undetectable, or offers the ability to diagnose a medical condition earlier in a patient population than allowed by currently available methods, and there must also be evidence that use of the new medical service or technology to make a diagnosis affects the management of the patient;

++ The use of the new medical service or technology significantly improves clinical outcomes relative to services or technologies previously available as demonstrated by one or more of the following: A reduction in at least one clinically significant adverse event, including a reduction in mortality or a clinically significant complication; a decreased rate of at least one subsequent diagnostic or therapeutic intervention; a decreased number of future hospitalizations or physician visits; a more rapid beneficial resolution of the disease process treatment including, but not limited to, a reduced length of stay or recovery time; an improvement in one or more activities of daily living; an improved quality of life; or, a demonstrated greater medication adherence or compliance; or

++ The totality of the circumstances otherwise demonstrates that the new medical service or technology substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries.

• Evidence from the following published or unpublished information sources from within the United States or elsewhere may be sufficient to establish that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries: Cinical trials, peer reviewed journal articles; study results; meta-analyses; consensus statements; white papers; patient surveys; case studies; reports; systematic literature reviews; letters from major healthcare associations; editorials and letters to the editor; and public comments. Other appropriate information sources may be considered.

• The medical condition diagnosed or treated by the new medical service or technology may have a low prevalence among Medicare beneficiaries.

• The new medical service or technology may represent an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of a subpopulation of patients with the medical condition diagnosed or treated by the new medical service or technology.

We refer the reader to the FY 2020 IPPS/LTCH PPS final rule for additional discussion of the evaluation of substantial clinical improvement for purposes of new technology add-on payments under the IPPS.

We note, consistent with the discussion in the FY 2003 IPPS final rule (67 FR 50015), that although we are affiliated with the FDA and we do not question the FDA's regulatory responsibility for decisions related to marketing authorization (for example, approval, clearance, etc.), we do not rely upon FDA criteria in our determination of what drugs, devices, or technologies qualify for new technology add-on payments under Medicare. Our criteria do not depend on the standard of safety and efficacy on which the FDA relies but on a demonstration of substantial clinical improvement in the Medicare population (particularly patients over age 65).

c. Alternative Inpatient New Technology Add-On Payment Pathway

Beginning with applications for FY 2021 new technology add-on payments, under the regulations at § 412.87(c), a medical device that is part of FDA's Breakthrough Devices Program may qualify for the new technology add-on payment under an alternative pathway. Additionally, under the regulations at § 412.87(d) for certain antimicrobial products, beginning with FY 2021, a drug that is designated by the FDA as a Qualified Infectious Disease Product (QIDP), and, beginning with FY 2022, a drug that is approved by the FDA under the Limited Population Pathway for Antibacterial and Antifungal Drugs (LPAD), may also qualify for the new technology add-on payment under an alternative pathway. We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42292 through 42297) and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58737 through 58739) for a complete discussion on this policy. We note that a technology is not required to have the specified FDA designation at the time the new technology add-on payment application is submitted. CMS will review the application based on the information provided by the applicant under the alternative pathway specified by the applicant. However, to receive approval for the new technology add-on payment under that alternative pathway, the technology must have the applicable FDA designation and meet all other requirements in the regulations in § 412.87(c) and (d), as applicable.

(1) Alternative Pathway for Certain Transformative New Devices

For applications received for new technology add-on payments for FY 2021 and subsequent fiscal years, if a medical device is part of FDA's Breakthrough Devices Program and received FDA marketing authorization, it will be considered new and not substantially similar to an existing technology for purposes of the new technology add-on payment under the IPPS, and will not need to meet the requirement under § 412.87(b)(1) that it represent an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. This policy is codified at § 412.87(c). Under this alternative pathway, a medical device that has received FDA marketing authorization (that is, has been approved or cleared by, or had a De Novo classification request granted by, FDA) and that is part of FDA's Breakthrough Devices Program will need to meet the cost criterion under § 412.87(b)(3), and will be considered new as reflected in § 412.87(c)(2). We note, in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58734 through 58736), we clarified our policy that a new medical device under this alternative pathway must receive marketing authorization for the indication covered by the Breakthrough Devices Program designation. We refer the reader to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58734 through 58736) for a complete discussion regarding this clarification.

(2) Alternative Pathway for Certain Antimicrobial Products

For applications received for new technology add-on payments for certain antimicrobial products, beginning with FY 2021, if a technology is designated by FDA as a QIDP and received FDA marketing authorization, and, beginning with FY 2022, if a drug is approved under FDA's LPAD pathway and used for the indication approved under the LPAD pathway, it will be considered new and not substantially similar to an existing technology for purposes of new technology add-on payments and will not need to meet the requirement that it represent an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. We codified this policy at § 412.87(d). Under this alternative pathway for QIDPs and LPADs, a medical product that has received FDA marketing authorization and is designated by FDA

as a QIDP or approved under the LPAD pathway will need to meet the cost criterion under § 412.87(b)(3), and will be considered new as reflected in § 412.87(d)(2).

We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42292 through 42297) and FY 2021 IPPS/LTCH PPS final rule (85 FR 58737 through 58739) for a complete discussion on this policy. We note, in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58737 through 58739), we clarified that a new medical product seeking approval for the new technology add-on payment under the alternative pathway for QIDPs must receive marketing authorization for the indication covered by the QIDP designation. We also finalized our policy to expand our alternative new technology add-on payment pathway for certain antimicrobial products to include products approved under the LPAD pathway and used for the indication approved under the LPAD pathway.

d. Additional Payment for New Medical Service or Technology

The new medical service or technology add-on payment policy under the IPPS provides additional payments for cases with relatively high costs involving eligible new medical services or technologies, while preserving some of the incentives inherent under an average-based prospective payment system. The payment mechanism is based on the cost to hospitals for the new medical service or technology. As noted previously, we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add-on payments under the IPPS for capital-related costs (72 FR 47307 through 47308).

For discharges occurring before October 1, 2019, under § 412.88, if the costs of the discharge (determined by applying operating cost-to-charge ratios (CCRs) as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), CMS made an add-on payment equal to the lesser of: (1) 50 percent of the costs of the new medical service or technology; or (2) 50 percent of the amount by which the costs of the case exceed the standard DRG payment.

Beginning with discharges on or after October 1, 2019, for the reasons discussed in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42297 through 42300), we finalized an increase in the new technology add-on payment percentage, as reflected at § 412.88(a)(2)(ii). Specifically, for a new technology other than a medical product designated by FDA as a QIDP, beginning with discharges on or after October 1, 2019, if the costs of a discharge involving a new technology (determined by applying CCRs as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 65 percent of the costs of the new medical service or technology; or (2) 65 percent of the amount by which the costs of the case exceed the standard DRG payment. For a new technology that is a medical product designated by FDA as a QIDP, beginning with discharges on or after October 1, 2019, if the costs of a discharge involving a new technology (determined by applying CCRs as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 75 percent of the costs of the new medical service or technology; or (2) 75 percent of the amount by which the costs of the case exceed the standard DRG payment. For a new technology that is a medical product approved under FDA's LPAD pathway, beginning with discharges on or after October 1, 2020, if the costs of a discharge involving a new technology (determined by applying CCRs as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 75 percent of the costs of the new medical service or technology; or (2) 75 percent of the amount by which the costs of the case exceed the standard DRG payment. As set forth in § 412.88(b)(2), unless the discharge qualifies for an outlier payment, the additional Medicare payment will be limited to the full MS–DRG payment plus 65 percent (or 75 percent for certain antimicrobial products (QIDPs and LPADs)) of the estimated costs of the new technology or medical service.

We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42297 through 42300) for complete discussion on the increase in the new technology add on payment beginning with discharges on or after October 1, 2019.

Section 503(d)(2) of Public Law 108–173 provides that there shall be no reduction or adjustment in aggregate payments under the IPPS due to add-on payments for new medical services and technologies. Therefore, in accordance with section 503(d)(2) of Public Law 108–173, add-on payments for new medical services or technologies for FY 2005 and subsequent years have not been subjected to budget neutrality.

e. Evaluation of Eligibility Criteria for New Medical Service or Technology Applications

In the FY 2009 IPPS final rule (73 FR 48561 through 48563), we modified our regulations at § 412.87 to codify our longstanding practice of how CMS evaluates the eligibility criteria for new medical service or technology add-on payment applications. That is, we first determine whether a medical service or technology meets the newness criterion, and only if so, do we then make a determination as to whether the technology meets the cost threshold and represents a substantial clinical improvement over existing medical services or technologies. We specified that all applicants for new technology add-on payments must have FDA approval or clearance by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. In the FY 2021 IPPS final rule, to more precisely describe the various types of FDA approvals, clearances and classifications that we consider under our new technology add-on payment policy, we finalized a technical clarification to the regulation to indicate that new technologies must receive FDA marketing authorization (such as pre-market approval (PMA); 510(k) clearance; the granting of a De Novo classification request, or approval of a New Drug Application (NDA)) by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. Consistent with our longstanding policy, we consider FDA marketing authorization as representing that a product has received FDA approval or clearance when considering eligibility for the new technology add-on payment under § 412.87(e)(2) (85 FR 58742).

Additionally, in the FY 2021 IPPS final rule (85 FR 58739 through 58742), we finalized our proposal to provide conditional approval for new technology add-on payment for a technology for which an application is submitted under the alternative pathway for certain antimicrobial products at § 412.87(d) that does not receive FDA marketing authorization by the July 1 deadline specified in § 412.87(e)(2), provided that the technology otherwise meets the applicable add-on payment criteria. Under this policy, cases involving eligible antimicrobial products would begin receiving the new technology add-on payment sooner, effective for discharges the quarter after the date of FDA marketing authorization provided

that the technology receives FDA marketing authorization by July 1 of the particular fiscal year for which the applicant applied for new technology add-on payments.

f. Council on Technology and Innovation (CTI)

The Council on Technology and Innovation at CMS oversees the agency's cross-cutting priority on coordinating coverage, coding and payment processes for Medicare with respect to new technologies and procedures, including new drug therapies, as well as promoting the exchange of information on new technologies and medical services between CMS and other entities. The CTI, composed of senior CMS staff and clinicians, was established under section 942(a) of Public Law 108–173. The Council is co-chaired by the Director of the Center for Clinical Standards and Quality (CCSQ) and the Director of the Center for Medicare (CM), who is also designated as the CTI's Executive Coordinator.

The specific processes for coverage, coding, and payment are implemented by CM, CCSQ, and the local Medicare Administrative Contractors (MACs) (in the case of local coverage and payment decisions). The CTI supplements, rather than replaces, these processes by working to assure that all of these activities reflect the agency-wide priority to promote high-quality, innovative care. At the same time, the CTI also works to streamline, accelerate, and improve coordination of these processes to ensure that they remain up to date as new issues arise. To achieve its goals, the CTI works to streamline and create a more transparent coding and payment process, improve the quality of medical decisions, and speed patient access to effective new treatments. It is also dedicated to supporting better decisions by patients and doctors in using Medicare-covered services through the promotion of better evidence development, which is critical for improving the quality of care for Medicare beneficiaries.

To improve the understanding of CMS' processes for coverage, coding, and payment and how to access them, the CTI has developed an ''Innovator's Guide'' to these processes. The intent is to consolidate this information, much of which is already available in a variety of CMS documents and in various places on the CMS website, in a user friendly format. This guide was published in 2010 and is available on the CMS website at: *https://www.cms.gov/Medicare/Coverage/CouncilonTechInnov/Downloads/Innovators-Guide-Master-7-23-15.pdf*.

As we indicated in the FY 2009 IPPS final rule (73 FR 48554), we invite any product developers or manufacturers of new medical services or technologies to contact the agency early in the process of product development if they have questions or concerns about the evidence that would be needed later in the development process for the agency's coverage decisions for Medicare.

The CTI aims to provide useful information on its activities and initiatives to stakeholders, including Medicare beneficiaries, advocates, medical product manufacturers, providers, and health policy experts. Stakeholders with further questions about Medicare's coverage, coding, and payment processes, or who want further guidance about how they can navigate these processes, can contact the CTI at *CTI@cms.hhs.gov*.

g. Application Information for New Medical Services or Technologies

Applicants for add-on payments for new medical services or technologies for FY 2023 must submit a formal request, including a full description of the clinical applications of the medical service or technology and the results of any clinical evaluations demonstrating that the new medical service or technology represents a substantial clinical improvement (unless the application is under one of the alternative pathways as previously described), along with a significant sample of data to demonstrate that the medical service or technology meets the high-cost threshold. Complete application information, along with final deadlines for submitting a full application, will be posted as it becomes available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech.html*. To allow interested parties to identify the new medical services or technologies under review before the publication of the proposed rule for FY 2023, the CMS website also will post the tracking forms completed by each applicant. We note that the burden associated with this information collection requirement is the time and effort required to collect and submit the data in the formal request for add-on payments for new medical services and technologies to CMS. The aforementioned burden is subject to the PRA and approved under OMB control number 0938–1347.

As discussed previously, in the FY 2020 IPPS/LTCH PPS final rule, we adopted an alternative inpatient new technology add-on payment pathway for certain transformative new devices and for Qualified Infectious Disease Products, as set forth in the regulations at § 412.87(c) and (d). The change in burden associated with these changes to the new technology add-on payment application process were discussed in a revision of the information collection requirement (ICR) request currently approved under OMB control number 0938–1347. In accordance with the implementing regulations of the PRA, we detailed the revisions of the ICR and published the required 60-day notice on August 15, 2019 (84 FR 41723) and 30-day notice on December 17, 2019 (84 FR 68936) to solicit public comments.

2. Public Input Before Publication of a Notice of Proposed Rulemaking on Add-On Payments

Section 1886(d)(5)(K)(viii) of the Act, as amended by section 503(b)(2) of Public Law 108–173, provides for a mechanism for public input before publication of a notice of proposed rulemaking regarding whether a medical service or technology represents a substantial clinical improvement or advancement. The process for evaluating new medical service and technology applications requires the Secretary to—

- Provide, before publication of a proposed rule, for public input regarding whether a new service or technology represents an advance in medical technology that substantially improves the diagnosis or treatment of Medicare beneficiaries;
- Make public and periodically update a list of the services and technologies for which applications for add-on payments are pending;
- Accept comments, recommendations, and data from the public regarding whether a service or technology represents a substantial clinical improvement; and
- Provide, before publication of a proposed rule, for a meeting at which organizations representing hospitals, physicians, manufacturers, and any other interested party may present comments, recommendations, and data regarding whether a new medical service or technology represents a substantial clinical improvement to the clinical staff of CMS.

In order to provide an opportunity for public input regarding add-on payments for new medical services and technologies for FY 2022 prior to publication of this FY 2022 IPPS/LTCH PPS proposed rule, we published a notice in the **Federal Register** on October 16, 2020 (85 FR 65815), and held a virtual town hall meeting on December 15 and 16, 2020. In the announcement notice for the meeting,

we stated that the opinions and presentations provided during the meeting would assist us in our evaluations of applications by allowing public discussion of the substantial clinical improvement criterion for the FY 2022 new medical service and technology add on payment applications before the publication of the FY 2022 IPPS/LTCH PPS proposed rule.

Approximately 330 individuals registered to attend the 2-day virtual town hall meeting. We posted the recordings of the 2-day virtual town hall on the CMS web page at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech*. We considered each applicant's presentation made at the town hall meeting, as well as written comments received by the December 28, 2020 deadline, in our evaluation of the new technology add on payment applications for FY 2022 in the development of this FY 2022 IPPS/LTCH PPS proposed rule.

In response to the published notice and the December 15–16, 2020 New Technology Town Hall meeting, we received written comments regarding the applications for FY 2022 new technology add on payments. As explained earlier and in the **Federal Register** notice announcing the New Technology Town Hall meeting (85 FR 65815 through 65817), the purpose of the meeting was specifically to discuss the substantial clinical improvement criterion with regard to pending new technology add-on payment applications for FY 2022. Therefore, we are not summarizing those written comments in this proposed rule that are unrelated to the substantial clinical improvement criterion. In section II.H.5. of the preamble of this proposed rule, we are summarizing comments regarding individual applications, or, if applicable, indicating that there were no comments received in response to the New Technology Town Hall meeting notice or New Technology Town Hall meeting, at the end of each discussion of the individual applications.

3. ICD–10–PCS Section ''X'' Codes for Certain New Medical Services and Technologies

As discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49434), the ICD–10–PCS includes a new section containing the new Section ''X'' codes, which began being used with discharges occurring on or after October 1, 2015. Decisions regarding changes to ICD–10–PCS Section ''X'' codes will be handled in the same manner as the decisions for all of the other ICD–10–PCS code changes. That is, proposals to create, delete, or revise Section ''X'' codes under the ICD–10–PCS structure will be referred to the ICD–10 Coordination and Maintenance Committee. In addition, several of the new medical services and technologies that have been, or may be, approved for new technology add-on payments may now, and in the future, be assigned a Section ''X'' code within the structure of the ICD–10–PCS. We posted ICD–10–PCS Guidelines on the CMS website at: *https://www.cms.gov/medicare/icd-10/2021-icd-10-pcs*, including guidelines for ICD–10–PCS Section ''X'' codes. We encourage providers to view the material provided on ICD–10–PCS Section ''X'' codes.

4. Proposed FY 2022 Status of Technologies Approved for FY 2021 New Technology Add-On Payments

In this section of the proposed rule, we discuss the proposed FY 2022 status of 23 technologies approved for FY 2021 new technology add-on payments, as set forth in the tables that follow. In general, we extend new technology add-on payments for an additional year only if the 3-year anniversary date of the product's entry onto the U.S. market occurs in the latter half of the upcoming fiscal year. We refer the reader to section II.F.6.b.(1). of the preamble of this proposed rule for discussion of CONTEPO, which we conditionally approved for FY 2021 new technology add-on payments under the alternative pathway for certain antimicrobial products, subject to the technology receiving FDA marketing authorization by July 1, 2021. As of the time of the development of this proposed rule, CONTEPO has not yet received FDA marketing authorization.

a. Proposed Continuation of New Technology Add-On Payments for FY 2022 for Technologies Still Considered To Be New

In the table in this section of the proposed rule, we present our proposals to continue the new technology add-on payment for FY 2022 for those technologies that were approved for the new technology add-on payment for FY 2021 and which would still considered ''new'' for purposes of new technology add-on payments for FY 2022.

Our policy is that a medical service or technology may continue to be considered ''new'' for purposes of new technology add-on payments within 2 or 3 years after the point at which data begin to become available reflecting the inpatient hospital code assigned to the new service or technology. Our practice has been to begin and end new technology add-on payments on the basis of a fiscal year, and we have generally followed a guideline that uses a 6-month window before and after the start of the fiscal year to determine whether to extend the new technology add-on payment for an additional fiscal year. In general, we extend new technology add-on payments for an additional year only if the 3-year anniversary date of the product's entry onto the U.S. market occurs in the latter half of the fiscal year (70 FR 47362).

The table in this section lists the technologies for which we are proposing to continue making new technology add-on payments for FY 2022 because they would still be considered new for purposes of new technology add-on payments. This table also presents the newness start date, new technology add-on payment start date, relevant final rule citations from prior fiscal years, proposed maximum add-on payment amount, and coding assignments. We refer readers to the cited final rules in the following table for a complete discussion of the new technology add-on payment application, coding and payment amount for these technologies, including the applicable indications and discussion of the newness start date.

BILLING CODE 4120–01–P

b. Proposal To Extend New Technology Add-On Payments

Section 1886(d)(5)(K)(ii)(II) of the Act provides for the collection of data with respect to the costs of a new medical service or technology described in subclause (I) for a period of not less than 2 years and not more than 3 years beginning on the date on which an inpatient hospital code is issued with respect to the service or technology. As explained in the FY 2005 IPPS final rule (69 FR 49002), the intent of section 1886(d)(5)(K) of the Act and regulations under § 412.87(b)(2) is to pay for new medical services and technologies for the first 2 to 3 years that a product comes on the market, during the period when the costs of the new technology are not yet fully reflected in the DRG weights. Generally, we use FDA approval (that is, marketing authorization) as the indicator of the time when a technology begins to become available on the market and data reflecting the costs of the technology begin to become available for recalibration of the DRGs. The costs of the new medical service or technology, once paid for by Medicare for this 2-year to 3-year period, are accounted for in the MedPAR data that are used to recalibrate the DRG weights on an annual basis. Therefore, we limit the add-on payment window for those technologies that have passed this 2- to 3-year timeframe.

As discussed in the FY 2006 IPPS final rule (70 FR 47349) and subsequent years, we do not believe that case volume is a relevant consideration for making the determination as to whether a product is ''new.'' Consistent with the statute, a technology no longer qualifies as ''new'' once it is more than 2 to 3 years old, irrespective of how frequently it has been used in the Medicare population. Therefore, if a product is more than 2 to 3 years old, we have historically considered its costs to be included in the MS–DRG relative weights whether its use in the Medicare population has been frequent or infrequent.

However, in light of the unique circumstances for FY 2022 ratesetting, for which we are proposing to use the FY 2019 MedPAR claims data where we ordinarily would have used the FY 2020 MedPAR claims data for purposes of developing the FY 2022 relative weights, for the reasons discussed in section I.F. of the preamble of this proposed rule, we believe it may be appropriate to make a one-time exception to this long-standing policy for all technologies approved for new technology add-on payments for FY 2021, but for which the add-on payments would otherwise be discontinued beginning in FY 2022 because the technologies would no longer be considered new.

As discussed in section I.F. of the preamble of this proposed rule, ordinarily, the best available MedPAR data for ratesetting would be the most recent MedPAR file that contains claims from discharges for the fiscal year that is 2 years prior to the fiscal year that is the subject of the rulemaking. For FY 2022 ratesetting, under ordinary circumstances, the best available data would be the FY 2020 MedPAR file. As discussed in section I.F. of the preamble of this proposed rule, the FY 2020 MedPAR claims file contains data significantly impacted by the COVID–19 PHE, primarily in that the utilization of inpatient services was generally markedly different for certain types of services in FY 2020 than would have been expected in the absence of the PHE. Accordingly, we question whether the FY 2020 MedPAR claims file is the best available data to use for the FY 2022 ratesetting.

In our discussion in section I.F. of the preamble of this proposed rule, we highlighted two factors we considered in assessing which data sources would represent the best available data to use in the FY 2022 ratesetting. The first factor is whether the FY 2019 data, which is from before the COVID–19 PHE, or the FY 2020 data, which includes the COVID–19 PHE time period, is a better overall approximation of the FY 2022 inpatient experience. After analyzing this issue, for the reasons discussed in section I.F. of the preamble of this proposed rule, we believe for purposes of this proposed rule that FY 2019 data are generally a better overall approximation of FY 2022. The second factor is to what extent the decision to use the FY 2019 or FY 2020 data differentially impacts the FY 2022 IPPS ratesetting. As discussed more fully in section I.F of the preamble of this proposed rule, after analyzing this issue, we determined that the decision does differentially impact the overall FY 2022 IPPS ratesetting. For example, we determined that the effect on the FY 2022 MS–DRG relative weights is more limited if the FY 2019-based weights are used rather than the FY 2020-based weights, should the FY 2022 inpatient experience not match the assumption used to calculate the MS–DRG relative weights.

Based on our analyses, we are proposing to use FY 2019 data for the FY 2022 ratesetting for circumstances

where the FY 2020 data is significantly impacted by the COVID–19 PHE. Because we believe the FY 2020 MedPAR claims data is significantly impacted by the COVID–19 PHE, we are proposing to use the FY 2019 MedPAR claims data for purposes where we ordinarily would have used the FY 2020 MedPAR claims data, including for purposes of developing the FY 2022 relative weights. We refer the reader to section I.F. of the preamble of this proposed rule for a further discussion on our analysis of the best available data for FY 2022 ratesetting.

As discussed previously, in general, we extend new technology add-on payments for an additional year only if the 3-year anniversary date of the product's entry onto the U.S. market occurs in the latter half of the upcoming fiscal year. Because we are proposing to use FY 2019 MedPAR data instead of FY 2020 MedPAR data for the FY 2022 IPPS ratesetting, the costs for a new technology for which the 3-year anniversary date of the product's entry onto the U.S. market occurs prior to the latter half of the upcoming fiscal year (FY 2022) may not be fully reflected in the MedPAR data used to recalibrate the MS–DRG relative weights for FY 2022. Therefore, in light of our proposal to use FY 2019 data instead of FY 2020 data to develop the FY 2022 relative weights, we believe it would be appropriate to allow for a one-year extension of new technology add-on payments for those technologies for which the new technology add-on payment would otherwise be discontinued beginning with FY 2022. Accordingly, we are proposing to use our authority under section 1886(d)(5)(I) of the Act to provide for a one-year extension of new technology add-on payments for FY 2022 for those technologies listed in the table that follows. We note that if we were to finalize our alternative approach of using the same FY 2020 data that we would ordinarily use for purposes of FY 2022 ratesetting, including development of the FY 2022 relative weights, as discussed in section I.F. of the preamble of this proposed rule, we would also finalize to discontinue the new technology add-on payments for these expiring technologies beginning in FY 2022, consistent with our historic policies.

We note that this table also presents the newness start date, new technology add-on payment start date, relevant final rule citations from prior fiscal years, proposed maximum add-on payment amount, and coding assignments for these technologies. We refer readers to the final rules cited in the table for a complete discussion of the new technology add-on payment application, coding and payment amount for these technologies, including the applicable indications and discussion of the newness start date.

We are inviting public comment on our proposal to use our authority under section 1886(d)(5)(I) of the Act to provide for a 1-year extension of new technology add-on payments for FY 2022 for those technologies for which the new technology add-on payment would otherwise be discontinued beginning with FY 2022.

We finally note, with regard to ContaCT which is a technology sold on a subscription basis, we continue to welcome comments from the public as to the appropriate method to determine a cost per case for technologies sold on a subscription basis, including comments on whether the cost per case should be estimated based on subscriber hospital data as described previously, and if so, whether the cost analysis should be updated based on the most recent subscriber data for each year for which the technology may be eligible for the new technology add-on payment.

BILLING CODE 4120–01–C

5. FY 2022 Applications for New Technology Add-On Payments (Traditional Pathway)

a. Aidoc Briefcase for PE

Aidoc Medical Ltd. (Aidoc) submitted an application for new technology add-on payments for Aidoc Briefcase for PE (''Briefcase for PE'') for FY 2022. According to the applicant, Briefcase for PE is an FDA cleared, artificial intelligence (AI)-based solution for triage and notification of suspected pulmonary embolism (PE) cases.

The applicant stated that the device assists hospitals and radiologists by flagging and communicating suspected positive findings of PE in computed tomography (CT) pulmonary angiography (CTPA) examinations, which prompts the radiologist to assess relevant Digital Imaging and Communications in Medicine (DICOM) imaging files, allowing suspect cases to receive attention sooner than otherwise would have occurred, which in turn improves clinical outcomes. According to the applicant, patients with PE or suspected PE typically present at hospital emergency departments (EDs). The applicant stated that for these patients, ED physicians complete a brief evaluation and order imaging, which typically includes CTPA. With Briefcase for PE, CTPA images are automatically forwarded to the applicant's cloud-based engine where they are analyzed by an AI algorithm. The applicant claims that when Briefcase for PE detects a suspected PE, the radiologist is alerted via the user interface of the Aidoc Worklist Application that is installed on the radiologist's desktop. The applicant asserted that the notification prompts the radiologist to review the CTPA images and communicate with the emergency room team currently caring for the patient so that the appropriate clinical action may be taken sooner than it would otherwise have occurred in the absence of the tool.

The applicant stated that acute PE is a severe manifestation of venous thromboembolism (VTE) and occurs when a blood clot (thrombus) forms in a vein and then dislodges and travels to the pulmonary arteries in the lungs. The applicant stated acute symptomatic PE can cause death within 1 hour of onset in up to 10 percent of cases [7] and it is estimated to be the third largest cause of cardiovascular death after coronary artery disease and stroke.[8] [9] [10] [11] The applicant further noted that acute PE is a life-threatening medical emergency that demands urgent intervention and clinical studies have demonstrated a strong correlation between time to communication of PE findings, treatment, and clinical outcomes.[12] [13] [14] According to the applicant, in a typical workflow, a patient presenting to a hospital with signs or symptoms of PE would move through the system as follows: (1) Patient presents with suspected PE to the ED; (2) Patient receives contrast-enhanced CTPA imaging; (3) Technologist processes and reconstructs the CT images and manually routes them to the hospital picture archiving and communication system (PACS); (4) The exam enters a first-in-first-out (FIFO) reading queue, where it awaits radiological interpretation; (5) Radiologist reads the CT images and makes the diagnosis of PE; (6) The radiologist informs the referring physician of positive PE either verbally or through the radiologist report; (7) ED physician and/or on-call pulmonologist decide on the management strategy; (8) If appropriate, the patient proceeds to treatment.

The applicant asserted that the FIFO workflow is the standard of care. The applicant stated that Briefcase for PE allows facilities to substantially shorten the period of time between when the patient receives CTPA imaging (Step 2) and when the radiologist informs the referring physician of positive PE (Step 5). The applicant stated that Briefcase for PE streamlines this workflow using AI to analyze CTPA images of the chest automatically and notifies the radiologist that a suspected PE has been identified, enabling the radiologist to review imaging and make diagnostic decisions faster by prioritizing these images for review in the queue.

With respect to the newness criterion, Briefcase for PE received FDA 510(k) clearance on April 15, 2019 to market the device under FDA 510(k) number K190072. The FDA clearance for Briefcase for PE was based on substantial equivalence to the legally marketed predicate device, Briefcase for Intracranial Hemorrhage (ICH) (FDA 510(k) number K180647), as both of these devices use AI algorithms to analyze images and highlight cases for further action based on CT images. Briefcase for ICH received FDA 510(k) clearance on August 1, 2018. The predicate device for Briefcase for ICH is Viz.AI's ContaCT, which received De Novo premarket approval in February of 2018. The applicant asserted Briefcase for ICH is indicated for use in the analysis of non-enhanced head CT images, whereas Briefcase for PE is indicated for use in the analysis of non-enhanced CTPA images. According to the applicant, there are currently no ICD–10–PCS procedure codes to adequately describe Briefcase for PE. The applicant submitted a request for approval of a unique ICD–10–PCS procedure code to identify use of the technology beginning FY 2022.

Under the newness criterion, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With respect to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, according to the applicant, Briefcase for PE is the only FDA-cleared technology that uses computer-aided triage and notification to rapidly detect PE and shorten time to notification of the radiologist. The applicant claimed that no other FDA approved or cleared technology uses the same mechanism of action for computer-aided triage and prioritization of PE.

With respect to the second criterion, whether a product is assigned to the same or a different MS–DRG, the applicant stated it expects that patients evaluated for PE or suspected PE using Briefcase for PE will be assigned to the

same DRGs as patients evaluated for PE or suspected PE under the current workflow or standard of care. The applicant estimates that under the MS–DRG grouper for FY 2021, Briefcase for PE could map to 279 different MS–DRGs, with MS–DRGs 175 (Pulmonary embolism with major complication or comorbidity (MCC) or acute cor pulmonale) and 176 (Pulmonary embolism without MCC) accounting for approximately 45 percent of the estimated cases.

With respect to the third criterion, whether the new use of technology involves the treatment of the same or similar type of disease and the same or similar patient population when compared to an existing technology, the applicant did not directly respond to the criterion but reiterated that no other existing technology is comparable to Briefcase for PE and that Briefcase for PE is the only FDA-cleared technology that uses computer aided triage and notification to rapidly detect PE and shorten time to notification of the radiologist.

We have the following concerns regarding whether the technology meets the substantial similarity criteria and whether it should be considered new. We note that the applicant asserted that Briefcase for ICH, the predicate device for Briefcase for PE, is identical in all aspects and differs only with respect to the training of the algorithm on PE (that is, non-enhanced head CT) and ICH (that is, non-enhanced CTPA) images. We are unclear whether the training of the algorithim on PE and ICH images would distinguish the mechanism of action for Briefcase for PE from Briefcase for ICH, or its predicate device, ContaCT, and we invite comment on whether Briefcase for PE represents a new mechanism of action. We note that although the applicant did not directly state whether Briefcase for PE involves the treatment of the same or similar type of disease and the same or similar patient population, we believe that Briefcase for PE would be used for a different disease and patient population than Briefcase for ICH and ContaCT.

We continue to be interested in public comments regarding issues related to determining newness for technologies that use AI, an algorithm, or software, as discussed in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58628). Specifically, we are interested in public comment on how these technologies, including devices classified as radiological computer aided triage and notification software and radiological computer-assisted diagnostic software, may be considered for the purpose of identifying a unique mechanism of action; how updates to AI, an algorithm or software would affect an already approved technology or a competing technology; whether software changes for an already approved technology could be considered a new mechanism of action, and whether an improved algorithm by competing technologies would represent a unique mechanism of action if the outcome is the same as an already approved AI new technology.

We invite public comments on whether Briefcase for PE meets the newness criterion.

With regard to the cost criterion, the applicant presented the following analysis. The applicant first identified the principal diagnoses associated with the PE-related MS–DRGs 175 (''Pulmonary embolism with MCC or acute cor pulmonale'') and 176 (''Pulmonary embolism without MCC''). The applicant then searched the FY 2019 proposed rule MedPAR Limited Data Set (LDS) for claims where the principal diagnoses were listed in any position on an inpatient claim. The applicant mapped the 2,517 identified claims to the list of unique MS–DRGs corresponding to these claims and aggregated the claims by MS–DRG. Per the applicant, under the MS–DRG grouper for FY 2021, potential cases representing patients who may be eligible for treatment using Briefcase for PE map to 279 MS–DRGs, with MS–DRGs 175 and 176 accounting for approximately 45 percent of estimated cases. The applicant also provided a table of the top 10 MS–DRGs, which represent approximately 69 percent of estimated cases.

MS-DRG	MS-DRG Title
175	PULMONARY EMBOLISM WITH MCC OR ACUTE COR PULMONALE
176	PULMONARY EMBOLISM WITHOUT MCC
871	SEPTICEMIA OR SEVERE SEPSIS WITHOUT MV >96 HOURS WITH MCC
299	PERIPHERAL VASCULAR DISORDERS WITH MCC
208	RESPIRATORY SYSTEM DIAGNOSIS WITH VENTILATOR SUPPORT <=96 HOURS
291	HEART FAILURE AND SHOCK WITH MCC
280	ACUTE MYOCARDIAL INFARCTION, DISCHARGED ALIVE WITH MCC
163	MAJOR CHEST PROCEDURES WITH MCC
270	OTHER MAJOR CARDIOVASCULAR PROCEDURES WITH MCC
853	INFECTIOUS AND PARASITIC DISEASES WITH O.R. PROCEDURES WITH MCC

The applicant standardized the charges and applied the 2-year charge inflation factor used to adjust the outlier threshold determination, which the applicant stated was 10.22 percent. We note that the actual 2-year inflation factor in the FY 2021 IPPS/LTCH PPS final rule was 13.2 percent (85 FR 59039), which would have increased the inflated charges figure. The applicant did not remove charges for prior technology as the applicant maintained that no existing technology is comparable to Briefcase for PE. However, the applicant removed 31.9 percent of total accommodation charges, which the applicant maintained is consistent with their internal study which indicated that Briefcase for PE reduced the length of stay for PE-diagnosed patients.[15] Per the applicant, the study demonstrated a mean length of stay of 8.77 and 5.97 days for pre-AI and post-AI time periods, respectively.[16]

Next, the applicant added charges for the new technology. To calculate the charges for the new technology, the applicant multiplied the cases involving Briefcase for PE from each of its subscribing providers by a Medicare share of 52 percent to obtain the total estimated Medicare and non-Medicare cases. The applicant obtained the 52 percent Medicare share figure from a

[15] Maya M. et al. Artificial Intelligence Software for Flagging Pulmonary Embolism on CTPA Associated with Reduced Length of Stay. Abstract draft of an internal study performed by the applicant (unpublished).

[16] Ibid.

nationwide sample of inpatient claims provided by the Agency for Healthcare Research and Quality (AHRQ). Specifically, the applicant searched data from the Healthcare Cost and Utilization Project for discharges with the following codes: I2699, I2609, I2692, I2602, I2782, T790XXA, T800XXA, T791XXA, I2693, I2694, and I2601.[17] The applicant found 189,575 discharges, of which 52 percent identified Medicare as the payer. The applicant divided the total cost of the technology by the estimated total number of cases for each customer to obtain a provider-specific cost per case, which it then averaged across all customers to obtain an overall average cost per case. Finally, the applicant divided the average cost per case by the national average CCR for the CT cost center of 0.034 from the FY 2021 IPPS/LTCH PPS final rule (85 FR 58601).

The applicant calculated a final inflated average case-weighted standardized charge per case of $87,483, which exceeded the average case-weighted threshold amount of $71,312. Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant maintained that Briefcase for PE meets the cost criterion.

We would like more information regarding the methodology by which the applicant selected the diagnosis codes associated with MS–DRGs 175 and 176, as well as subanalyses that limit the cases to MS–DRGs 175 and 176 and the top 10 MS–DRGs, which per the applicant represent 45 percent of estimated cases and 69 percent of estimated cases, respectively. Additionally, the applicant appears to have used a single list price of Briefcase for PE per hospital with a cost per patient that can vary based on the volume of cases. We question whether the cost per patient varies based on the utilization of the technology by the hospitals. We are interested in more information about the applicant's cost per case calculation, including how the applicant selected the codes it used to search for discharges from the Healthcare Cost and Utilization Project, as well as the per unit cost of Briefcase for PE and how the total cost of the technology was calculated for each subscribing provider.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58630), we stated our understanding that there are unique circumstances to determining a cost per case for a technology that utilizes a subscription for its cost. We stated our intent to continue to consider the issues relating to the calculation of the cost per unit of technologies sold on a subscription basis as we gain more experience in this area. We continue to welcome comments from the public as to the appropriate method to determine a cost per case for such technologies, including comments on whether the cost per case should be estimated based on subscriber hospital data as described previously, and if so, whether the cost analysis should be updated based on the most recent subscriber data for each year for which the technology may be eligible for the new technology add-on payment. We also invite public comment on whether Briefcase for PE meets the cost criterion, particularly in light of the subscription model, for which the number of subscribers and the estimated cost per case based on that subscriber data may change over time.

With regard to the substantial clinical improvement criterion, the applicant claimed that Briefcase for PE represents an advance that substantially improves the ability to diagnose pulmonary embolism by pre-reading images of CTPAs, automatically identifying suspected PE in CTPA images, and notifying the radiologist before the radiologist would have opened the study in the standard of care, which the applicant claims is the FIFO workflow. The applicant also asserted that because of a reduction in time-to-exam-open, where Briefcase for PE notifies the radiologist to open and read CTPA studies that have a high probability of being positive for PE sooner than the radiologist would have under the FIFO workflow, the treating physician can initiate treatment sooner, which can reduce mortality and reduce length of stay related to PE.

The applicant provided data from an FDA pivotal study in support of its assertion that Briefcase for PE reduces time-to-exam-open compared to the standard of care and helps in prioritization of diagnosis.[18] For the FDA pivotal study, the applicant conducted a retrospective, blinded, multicenter, multinational study of the assessment of 184 CTPAs from 3 clinical sites (2 US and 1 outside US) using Briefcase for PE. The primary endpoint was to evaluate the software's performance in identifying pulmonary embolism on an approximately equal number of positive and negative cases (images with PE versus without PE), with a performance goal of at least 80 percent sensitivity (true positive rate) and specificity (true negative rate). Per the applicant, both measures exceeded the performance goal, with 90.6 percent sensitivity (95 percent CI: 82.2 percent–95.9 percent) and 89.9 percent specificity (95 percent CI: 82.2 percent–95.1 percent).

According to the applicant, the secondary endpoint of the FDA pivotal study was to evaluate time-to-notification for true positive PE cases compared to the FIFO workflow. The study showed that time-to-notification with Briefcase for PE is 3.9 minutes (95 percent CI: 3.7–4.1). The applicant noted that, in contrast, the time-to-exam-open in the FIFO workflow was significantly longer at 64.1 minutes (95 percent CI 36.6–91.5). The applicant stated the mean difference of 60.2 minutes (95 percent CI 32.7–87.6) for these two metrics is statistically significant, and assuming the radiologist receives a notification on a true positive PE case and acts on it immediately, it can save an average of 60.2 minutes (95 percent CI 32.7–87.6) compared to the time-to exam-open in a FIFO reading queue. Based on this data, the applicant concluded Briefcase for PE substantially shortened the time to diagnosis for PE cases as compared with the FIFO workflow.

The applicant further claimed that clinical studies and other real-world data have demonstrated comparable performance characteristics and shown that the integration of the Briefcase for PE software into the radiology workflow markedly improves time to notification for PE patients across a variety of clinical settings, geographies, and facilities. The applicant submitted a retrospective, single-site study by Weikert T., et al., which evaluated Briefcase for PE performance on 1,465 retrospective CTPA examinations from 2017 in an academic center outside the US.[19] The sensitivity and specificity were measured to be 92.7 percent (95 percent CI: 88.3–95.5 percent) and 95.5 percent (95 percent CI: 94.2–96.6 percent), respectively. The researchers concluded that the system has high diagnostic performance for the automatic detection of PE on CTPA exams and as such, speeds up the diagnostic workup of critical cases.

The applicant stated that unpublished data maintained by Aidoc suggest that real-world performance of Briefcase for PE is consistent with what was found in

[17] Healthcare Cost and Utilization Project. Free Health Care Statistics. *https://hcupnet.ahrq.gov/#setup*.

[18] Aidoc Briefcase for PE—Pivotal Study 1—FDA 510(k)—K190072. *http://www.accessdata.fda.gov/cdrh_docs/pdf19/K190072.pdf*.

[19] Weikert T, Winkel DJ, Bremerich J, Stieltjes B, Parmar V, Sauter AW, Sommer G. Automated detection of pulmonary embolism in CT pulmonary angiograms using an AI-powered algorithm. *Eur Radiol*. 2020 Jul 3. doi: 10.1007/s00330–020–06998–0. Epub ahead of print. PMID: 32621243

the FDA pivotal study.[20] [21] The applicant stated that across 26 sites encompassing a variety of geographic locations across the United States, a total of 36,084 CTPA examinations were analyzed over a 90-day period (July 13, 2020–October 11, 2020). Time-to-notification metrics were calculated for all 4,748 CTPAs analyzed by the software and identified as positive for PE. Time-to-notification was calculated as the time to get the DICOM exam, de-identify it, upload it to the cloud, analyze and send a notification back to the worklist application. The applicant claimed that the mean time-to-notification for PE was 7.0 minutes (median: 6.1/IQR: 4.8). According to the applicant, over 85 percent of CTPA examinations identified as positive for PE were notified in under 10 minutes. The applicant concluded that the study demonstrates the ability of Briefcase for PE to provide fast time-to-notification on positive PE cases and its generalizability across different centers and patient populations.

The applicant submitted additional unpublished data from the 26 sites spread across a variety of geographic locations of the United States aggregated over a different 90-day period (September 17, 2020 to December 17, 2020).[22] Seven sites were excluded from the analysis due to having third-party integrations that prevented the ability to capture engagement metrics. Two engagement metrics were calculated: The open percentage and the time-to-open. The open percentage metric was calculated as the percentage of notifications that were presented to the radiologist and opened by at least one radiologist. The time-to-open metric was measured by calculating the time between the arrival of the Briefcase for PE notification and the time first opened by a radiologist. A total of 2,138 notifications for CTPA examinations found to be positive for PE by Briefcase for PE were analyzed. The open percentage was found to be 97 percent across all sites (min: 80 percent, max: 100 percent), and the mean time-to-open was found to be 2.13 minutes (median: 1.0/interquartile range: 2.0). The data provided by the applicant indicated over 90 percent of notifications were found to be opened in under 5 minutes. Based on this data, the study concluded that radiologists in the US readily engage with notifications for positive PE cases provided by Briefcase for PE and do so in a timely manner. The study asserted that engagement is an important metric to assess radiologist adoption of this technology, which is critical to its practical utility in shortening time to diagnosis and communication of PE to reduce the time to treatment and improve clinical outcomes.

The applicant also claimed that Briefcase for PE significantly improves clinical outcomes relative to the current standard of care using the FIFO workflow because the use of Briefcase for PE reduces time to diagnosis and treatment by notifying the radiologist to review the image for suspected PE faster in the workflow. The applicant claimed early diagnosis and treatment is important in acute PE where there exists a ''golden hour,'' during which a timely approach to diagnosis and therapy can affect outcomes by reducing mortality and reducing length of stay.[23]

The applicant provided two unpublished internal studies in support of the impact of Briefcase for PE on clinical outcomes. The applicant stated that in a single-site retrospective study, Maya M., et al. have shown a reduction in hospital length of stay for PE patients following the use of the Briefcase for PE system, compared to an equivalent time period prior to the use of the system.[24] The applicant stated that Maya M., et al. compared mean length of stay for 366 patients with a positive PE diagnosis during 10-month periods before and after Briefcase for PE was implemented at Cedars-Sinai Medical Center in December 2018 (206 patients before the use of Briefcase for PE and 160 patients after the AI intervention). 3,997 patient encounters that underwent CTPA imaging but that were not diagnosed with PE were split as 1,926 and 2,071 patient encounters for the pre/post-AI periods based on the admission dates. Hip fracture was chosen as a comparison group due to acuity, treatment-related factors, and similar length of stay to PE. 2,422 patient encounters for patients diagnosed with hip fractures, identified by ICD9 code 820 and 821, were split as 1,279 and 1,143 patient encounters for the pre/post-AI periods based on the admission dates. According to the applicant, the pre- and post-implementation had similar seasonality and numbers of ''hospital-wide patient encounters'' (103,626 vs 104,733 encounters). The applicant noted that for the PE diagnosed patients, a mean length of stay of 8.77 and 5.97 days was observed for the pre-AI and post-AI time periods, respectively. The applicant stated that the mean difference was 2.80 days (p-value <0.05). For the group that underwent related PE imaging but was not diagnosed with PE, a mean length of stay of 9.28 and 9.70 days was observed for the pre-AI and post-AI time periods, respectively (mean difference was −0.42 days (p-value <0.05)). For the hip fracture diagnosed patients, a mean length of stay of 6.90 and 6.69 days was observed for the pre-AI and post-AI time periods, respectively. The mean difference was 0.21 days (p-value >0.05). Additionally, for the hospital wide patients, a mean length of stay of 5.78 and 5.96 days was observed for the pre-AI and post-AI time periods, respectively. The mean difference was −0.18 days (p-value <0.05). According to the applicant, Maya et al. concluded that implementation of Briefcase for PE for flagging and prioritization of patients with PE resulted in significant reduction of length of stay that was not observed in other control groups.

The applicant also submitted a study by Raskin D., et al. which completed an additional retrospective, single-armed, single-site, study that indicated improved outcomes in PE patients, compared to a time period prior to the use of Briefcase for PE.[25] In Raskin D., et al., data for all patients older than 18 years with a diagnosis of PE on CTPA and admitted to the institution's ED was collected for the period before the use of the AI software (January 1, 2016–January 1, 2018; pre-AI) and afterwards (January 1, 2019–December 6, 2019; post-AI). According to the applicant, study variables included demographics, clinical data, and imaging data. The applicant stated the primary variables for outcomes were 30- and 120-day all-cause mortality. 175 patients were eligible for the entire analyzed period (123 pre-AI, 52 Post-AI). The study found that 30- and 120-day all-cause mortality were significantly reduced post-AI (8.1 percent vs 7.7 percent, 15.5 percent vs 9.6 percent, respectively, p<0.05). According to the applicant, Raskin D., et al. concluded that

[23] The term ''golden hour'' references a critical period of time which may be longer or shorter than a literal hour.

[24] Maya M. et al. Artificial Intelligence Software for Flagging Pulmonary Embolism on CTPA Associated with Reduced Length of Stay. Abstract draft of an internal study performed by the applicant (unpublished).

[25] Daniel Raskin D.,MD, Chen Hoffmann C.,MD, Gilad Twig G.,MD Ph.D., Eli Konen E.,MD, Gal Yaniv GMD Ph.D. Artificial Intelligence Software for Flagging Pulmonary Embolism on CTPA Associated with Reduction of Mortality. Abstract draft of an internal study performed by the applicant (unpublished).

implementation of Briefcase for PE for flagging patients with PE resulted in significant reduction of 30- and 120-day all-cause mortality.

The applicant submitted five additional clinical studies that do not directly involve the use of Briefcase for PE to demonstrate a strong correlation between time to communication of PE findings, initiation of treatment, and clinical outcomes. The applicants submitted a review by Kenneth E. Wood, further establishing a ''golden hour'' of PE during which a timely approach to diagnosis and therapy can potentially impact outcomes. According to the applicant, Wood states that major PE results whenever the combination of embolism size and underlying cardiopulmonary status interact to produce hemodynamic instability and that most deaths in patients occur within the first few hours after presentation, and rapid diagnosis and treatment is therefore essential to save patients' lives. One prospective, single-site study, Kumamaru K., et al. indicates the prevalence of a ''golden hour'' for PE diagnosis and treatment and concluded that delay (>1.5 hours of CTPA acquisition) in direct communication of acute PE diagnosis from radiologists to referring physicians was significantly correlated with a higher risk of delayed treatment initiation and death within 30 days. Another prospective, single-site study, Kline J., et al., concluded that patients with a delayed diagnosis had a higher rate of in-hospital adverse events (9 percent vs. 30 percent; p = 0.01). An additional retrospective, single-site study by Smith S., et al. observed an association between early administration of anticoagulation therapy and reduced mortality for patients with acute PE. Lastly, a retrospective, single-site study asserting a ''golden hour'' by Soh S., et al. was submitted by the applicant to demonstrate an association between early initiation of anticoagulation therapy and in-hospital mortality in high-risk PE patients who needed ICU care. According to the applicant, Soh S., et al. concluded that their analysis showed that the cutoff point of anticoagulation initiation to achieve improved survival rates was 5.2 hours (that is, golden hour). The applicant stated that the study observed an association between early anticoagulation and reduced mortality for patients with acute PE.

In reviewing the information submitted by the applicant as part of its FY 2022 new technology add-on payment application for Briefcase for PE, we note that the clinical literature provided by the applicant only compares the technology to unassisted FIFO workflows and not against existing electronic (for example, EHR ''stat'' orders) or manual (for example, verbal communication to radiologist) forms of prioritization, or other types of existing risk stratification tools or features currently available in EHRs. Additionally, we note that some of the studies provided by the applicant that took place over many years may not have accounted for confounding variables (for example, improvements in care for patients with suspected PE) that may have occurred during the study period. Comparing to the FIFO workflow alone assumes that no other changes occurred before and after the adoption of the system and that the hospitals in question did not implement any other changes to their standard operating procedures to stratify suspected PE cases over the period of time many of the provided studies took place. We also note that the applicant has not provided data on potential outcome concerns associated with this type of clinical decision support tool (for example, treatment delays due to false negatives, false positives, or multiple workflow prioritization alerts presented to the physician at the same time). We invite public comment on whether these issues may affect the tool's ability to help diagnose a medical condition earlier in a patient population.

Lastly, we note that the applicant does not measure the effect of its technology on actual treatment outcomes, instead relying on the assumption that faster treatment results in better outcomes. Without measuring this impact on treatment outcomes, we are uncertain if the technology will lead to substantive clinical outcomes. Given that the applicant references a critical ''golden hour'' which may be as long as 5.2 hours, the potential time savings resulting from the use of Briefcase for PE may be insubstantial in relation to the time within which outcomes are affected in the setting of PE.

We are inviting public comments on whether Briefcase for PE meets the substantial clinical improvement criterion.

We received a written public comment from the applicant in response to the New Technology Town Hall meeting regarding the application of Briefcase for PE for new technology add-on payments.

Comment: The applicant responded to questions received at the New Technology Town Hall Meeting. First the applicant was asked what the sensitivity and specificity of the standalone device is for identifying pulmonary embolism and how the sensitivity and specificity of the radiologist alone compare to the sensitivity and specificity of the radiologist when using the device. The applicant responded by reiterating the sensitivity and specificity data provided in the FDA pivotal study and restating that Briefcase for PE is a computer-aided triage and notification system that is not intended to aid in the diagnosis of PE but rather, Briefcase for PE identifies cases of suspected PE on CTPAs and, via triage and notification, prioritizes these cases for radiologist review.[26] [27] The applicant further restated that this triage and notification modifies the traditional radiology workflow in which images are reviewed on a FIFO basis to reduce the time-to-open-exam from over one hour to several minutes (standard of care vs. Briefcase for PE). The applicant restated that this reduction in time-to-open-exam has been demonstrated to improve patient outcomes, including hospital length of stay and post-discharge mortality. The applicant further noted that, because Briefcase for PE is a triage and notification system, no patient harm results from false positives or false negatives that may occur. The applicant explained that with respect to false positives, these suspected cases of PE will be triaged and the radiologist will be notified, prompting earlier review and diagnosis of the CTPA image by the radiologist. The applicant explained that for cases of PE that are missed by Briefcase for PE (that is, false negatives), the radiologist will review these CTPA images on a FIFO basis the same as today's standard of care and that triage and notification do not occur in the standard of care.

Second, the applicant was asked if Briefcase for PE decreased time outside of clinical trial protocols and how the applicant can be certain reducing time-to-notification affects the time period between when the CTPA is completed and the study is interpreted. In response, the applicant again reiterated data from the FDA pivotal study in restating that implementation of Briefcase for PE saves on average 60.2 minutes relative to the standard of care FIFO clinical workflow and that data maintained by Aidoc demonstrate that real-world performance of Briefcase for PE is consistent with the results achieved in the FDA study. The

[26] Aidoc Briefcase for PE—Pivotal Study 1—FDA 510(k)—K190072. *http://www.accessdata.fda.gov/cdrh_docs/pdf19/K190072.pdf.*

[27] Weikert T, Winkel DJ, Bremerich J, et al. Automated detection of pulmonary embolism in CT pulmonary angiograms using an AI-powered algorithm. *Eur Radiol.* 2020;30(12):6545–6553. doi:10.1007/s00330–020–06998–0.

applicant also submitted data summarized previously indicating mean time-to-open, as measured by calculating the time between when a notification first became available in the application and the time of open, was 2.13 minutes (median: 1.0/IQR: 2.0). The applicant restated that in addition to measuring the mean time-to-open, the open rate, or the percentage of notifications opened, was measured for this same population and the open rate was found to be 97 percent (min: 80 percent, max: 100 percent), with over 90 percent of notifications found to be opened in under 5 minutes.[28]

Also in response to this second question, the applicant reiterated data describing an independent analysis performed by Raskin, et al., examining the impact of Briefcase for PE implementation on 30- and 120-day all-cause mortality for all patients age 18 years or older with a diagnosis of PE on CTPA and admitted to Sheba Medical Center in Tel Aviv, Israel. The applicant restated data described previously indicating that investigators found that the post- Briefcase cohort had significantly reduced 30- and 120-day all-cause mortality compared to the pre-Briefcase cohort—14.9 percent vs 11.0 percent and 26.1 percent vs 20.4 percent, respectively. The applicant stated these observed effects equate to a reduction ratio of 26.6 percent ($p < 0.05$) and an odds-ratio of 1.425 (95 CI: 1.01–2.02) for 30-day all-cause mortality and a reduction ratio of 21.8 percent ($p < 0.05$) and an odds-ratio of 1.34 (95 percent CI: 1.05–1.81) for 120-day all-cause mortality.[29]

Response: We appreciate the applicant's comments. We will take these comments into consideration when deciding whether to approve new technology add-on payments for Briefcase for PE.

[29] Daniel Raskin D.,MD, Chen Hoffmann C.,MD, Gilad Twig G.,MD Ph.D., Eli Konen E.,MD, Gal Yaniv GMD Ph.D. Artificial Intelligence Software for Flagging Pulmonary Embolism on CTPA Associated with Reduction of Mortality. Abstract draft of an internal study performed by the applicant (unpublished).

b. Amivantamab

Johnson & Johnson Health Care Systems, Inc. submitted an application for new technology add-on payments for amivantamab for FY 2022. Amivantamab is intended for the treatment of metastatic non-small cell lung cancer (NSCLC). The applicant stated amivantamab is a bispecific monoclonal antibody able to inhibit the epidermal growth factor receptor (EGFR) and c-MET tyrosine kinase signaling pathways known to be involved in the pathogenesis of NSCLC. Per the applicant, amivantamab works by binding EGFR and c-MET targets present on the outside of the cell. The applicant noted lung cancer is the second most common cancer in the U.S., and approximately 85 percent of all lung cancers are NSCLC. The applicant stated EGFR mutations are present in 10 to 15 percent of patients with NSCLC and are categorized as either common EGFR mutations or atypical EGFR mutations. Per the applicant, common EGFR mutations in patients with NSCLC can be treated with small molecule, oral tyrosine kinase inhibitors that work inside the cell while patients with atypical EGFR mutations, such as exon 20 insertion mutations, do not respond well to small-molecule, oral EGFR inhibitors or to chemotherapy. The applicant stated exon 20 insertion mutations are the most frequently observed atypical EGFR mutations affecting 4 to 10 percent of NSCLC patients with an EGFR mutation, but there are no FDA approved targeted therapies for NSCLC patients with exon 20 insertion mutations.

With respect to the newness criterion, the applicant stated that, in March 2020, amivantamab (also known as JNJ–61186372) received Breakthrough Therapy designation from the FDA for the treatment of patients with metastatic NSCLC with EGFR exon 20 insertion mutation whose disease has progressed on or after platinum-based chemotherapy. The applicant stated they are seeking a Biologics License Application (BLA) for amivantamab for the treatment of patients with metastatic NSCLC with EGFR exon 20 insertion mutations whose disease has progressed on or after platinum-based chemotherapy and have not yet received FDA marketing authorization. Per the applicant, amivantamab is administered as an infusion on a 28 day cycle; weekly for the first cycle and then every 2 weeks, and continued until disease progression or unacceptable toxicity. The applicant stated there are currently no ICD–10–PCS procedure codes that uniquely identify the use of amivantamab. We note the applicant submitted a request for approval of a unique ICD–10–PCS procedure code to identify use of the technology beginning in FY 2022.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, the applicant asserted that the mechanism of action of amivantamab for treating NSCLC is unique as amivantamab is anticipated to be the first FDA-approved bispecific antibody therapy targeting EGFR and MET mutations simultaneously. The applicant asserted that both EGFR and MET are involved in NSCLC pathogenesis, progression, and development of resistance to other therapies. According to the applicant, the most common first-line treatment for atypical EGFR-positive patients due to exon 20 insertion mutations is platinum-based chemotherapy. Per the applicant, there is no standard of care after progression for second-line treatment, and patients receive a variety of therapies such as chemotherapy, immunotherapy, and tyrosine kinase inhibitors, as well as combinations of these therapies. The applicant reiterated that none of these treatments are FDA approved for this patient population and that they are associated with limited efficacy for these patients.

With respect to the second criterion, whether a product is assigned to the same or a different MS–DRG, the applicant stated that the use of amivantamab is not expected to affect the DRG assignment. In their cost analysis, as shown below, the applicant identified several MS–DRGs relevant to this technology.

MS-DRG	MS-DRG Description	Cases	Percentage of Cases
871	Septicemia Or Severe Sepsis w/o Mv >96 Hours w MCC	46	13.18%
180	Respiratory Neoplasms w MCC	26	7.45%
164	Major Chest Procedures w CC	17	4.87%
193	Simple Pneumonia & Pleurisy w MCC	14	4.01%
181	Respiratory Neoplasms w CC	12	3.44%
	All Other	234	67.05%
Total		**349**	**100.00%**

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or a similar type of disease and the same or similar patient population, the applicant stated that amivantamab treats a distinct patient population with metastatic NSCLC: Metastatic NSCLC with exon 20 insertion mutations whose disease has progressed on or after platinum-based chemotherapy. Per the applicant, there is currently no FDA-approved therapy for this patient population, and the most commonly used therapies are associated with limited efficacy.

In summary, the applicant asserted that amivantamab should be considered new and not substantially similar to an existing technology because the mechanism of action of amivantamab for treating NSCLC is unique and it treats a distinct patient population.

We are inviting public comments on whether amivantamab is substantially similar to other currently available therapies and/or technologies and whether this technology meets the newness criterion.

With regard to the cost criterion, the applicant provided the following analysis to demonstrate that the technology meets the cost criterion. The applicant searched the FY 2019 Medicare Provider Analysis and Review (MedPAR) final rule file for cases based on the presence of one of the following ICD–10–CM diagnosis codes for lung cancer:

Code	Code Descriptor
C34	Malignant neoplasm of bronchus and lung
C34.0	Malignant neoplasm of main bronchus
C34.00	Malignant neoplasm of unspecified main bronchus
C34.01	Malignant neoplasm of right main bronchus
C34.02	Malignant neoplasm of left main bronchus
C34.1	Malignant neoplasm of upper lobe, bronchus or lung
C34.10	Malignant neoplasm of upper lobe, unspecified bronchus or lung
C34.11	Malignant neoplasm of upper lobe, right bronchus or lung
C34.12	Malignant neoplasm of upper lobe, left bronchus or lung
C34.2	Malignant neoplasm of middle lobe, bronchus or lung
C34.3	Malignant neoplasm of lower lobe, bronchus or lung
C34.30	Malignant neoplasm of lower lobe, unspecified bronchus or lung
C34.31	Malignant neoplasm of lower lobe, right bronchus or lung
C34.32	Malignant neoplasm of lower lobe, left bronchus or lung
C34.8	Malignant neoplasm of overlapping sites of bronchus and lung
C34.80	Malignant neoplasm of overlapping sites of unspecified bronchus and lung
C34.81	Malignant neoplasm of overlapping sites of right bronchus and lung
C34.82	Malignant neoplasm of overlapping sites of left bronchus and lung
C34.9	Malignant neoplasm of unspecified part of bronchus or lung
C34.90	Malignant neoplasm of unspecified part of unspecified bronchus or lung
C34.91	Malignant neoplasm of unspecified part of right bronchus or lung
C34.92	Malignant neoplasm of unspecified part of left bronchus or lung

We note that the applicant also provided the following ICD–10–PCS procedure codes, which the applicant stated could be used to identify cases involving amivantamab in the absence of a unique ICD–10–PCS code.

Code	Code Descriptor
3E03005	Introduction of other antineoplastic into peripheral vein, open approach
3E03305	Introduction of other antineoplastic into peripheral vein, percutaneous approach
3E04005	Introduction of other antineoplastic into central vein, open approach
3E04305	Introduction of other antineoplastic into central vein, percutaneous approach

To further refine the cases used in the analysis, the applicant used the following methodology. Per the applicant, clinical data suggests 80 to 85 percent of lung cancer patients are NSCLC patients.[30] The applicant stated that, of those patients, 10–15 percent are EGFR-mutations patients,[31] [32] and of those, at least 9 percent have atypical EGFR mutations like exon 20 ins.[33] The applicant selected 0.93% (82.5% * 12.5% * 9%) of the cases identified based on the lung cancer diagnosis codes listed previously. The applicant stated this is the target population for amivantamab, which the applicant used for the cost analysis.

The applicant then accounted for the circumstances where amivantamab would be administered during an inpatient stay. The applicant stated that amivantamab will typically be administered in the outpatient setting, and that it assumed that amivantamab would be administered during an inpatient stay, possibly for care unrelated to a patient's cancer treatment, when that stay coincided with the 2-week cycle during which a patient receiving amivantamab would undergo an infusion in the outpatient setting were it not for their inpatient admission. The applicant stated that, because it is very important that patients receive continuity of cancer care, it assumed that some patients would receive their amivantamab infusion during their hospital stay. To account for this scenario, the applicant calculated the average length of stay for all of the cases in its patient population, which it asserted was about 5.862 days. The applicant then divided the average length of stay for all of the cases by 14, as per the applicant amivantamab is administered on 28-day cycle, with a weekly administration for the first cycle, and an administration every 2 weeks thereafter.

The applicant stated that current clinical guidelines are expected to give medical professionals discretion to administer amivantamab during the hospitalization or pause the treatment cycle. To account for physician discretion, the applicant included only 50 percent of these cases in the final cost analysis.

The applicant identified 349 cases mapping to the following MS–DRGs. The applicant has not made a request for amivantamab to map to a new or different MS–DRG for FY 2022.

MS-DRG	MS-DRG Description	Cases
871	Septicemia Or Severe Sepsis w/o Mv >96 Hours w MCC	46
180	Respiratory Neoplasms w MCC	26
164	Major Chest Procedures w CC	17
193	Simple Pneumonia & Pleurisy w MCCW Mcc	14
181	Respiratory Neoplasms w CC	12
	All Other	234
Total		**349**

The applicant assumed patients receiving amivantamab would receive one dose of the drug during their inpatient stay. Because amivantamab would be administered in addition to any other drugs the patient was receiving during their inpatient admission, the applicant did not remove costs associated with any previous technology. The applicant then standardized the charges using the FY 2019 IPPS/LTCH PPS final rule Impact file. Then the applicant applied the 2-year inflation factor of 13.2 percent (1.13218) from the FY 2021 IPPS/LTCH PPS final rule (85 FR 59039). The applicant then added charges for amivantamab, which the applicant determined using the inverse of the FY 2021 IPPS/LTCH PPS final rule pharmacy national average cost to charge ratio (CCR) of 0.187 (85 FR 58601).

Because the applicant calculated a final inflated average case-weighted standardized charge per case of $108,159, which exceeds the case weighted threshold of $64,736, the applicant maintains the technology meets the cost criterion.

Based on the information provided by the applicant, we have several concerns with regard to whether the technology meets the cost criterion. In its cost analysis, the applicant combined 234 cases from multiple MS–DRGs into one group with a case-weight of 67 percent of cases. We do not believe this is appropriate for the cost analysis. As reflected in § 412.87(b)(3), where cases eligible for a particular technology may be assigned to multiple MS–DRGs, in performing the cost analysis, the applicant should compare the charges of the cases to a threshold amount that is the lesser of 75 percent of the standardized amount or 75 percent of one standard deviation beyond the case-weighted average of all MS–DRGs to which the cases map. In the event that a single MS–DRG has fewer than 11 cases, the applicant should impute a minimum case number of 11 rather than the actual value. In this way, the appropriate threshold and case weighted threshold value can be calculated.

[30] ''What is Lung Cancer?'' American Cancer Society. 1 October 2019: *https://www.cancer.org/content/cancer/en/cancer/lung- cancer/about/what-is.html*.

[31] Wee, P., & Wang, Z. (2017). Epidermal growth factor receptor cell proliferation signaling pathways. *Cancers,* 9(5), 52.

[32] Pao, W., & Girard, N. (2011). New driver mutations in non-small-cell lung cancer. *The Lancet Oncology,* 12(2), 175–180.

[33] Arcila, M. E., Nafa, K., Chaft, J. E., Rekhtman, N., Lau, C., Reva, B. A., and Ladanyi, M. (2013). EGFR exon 20 insertion mutations in lung adenocarcinomas: Prevalence, molecular heterogeneity, and clinicopathologic characteristics. *Molecular Cancer Therapeutics,* 12(2), 220–229.

In its analysis, the applicant appears to take a sample of a larger case population based on clinical data. It is unclear whether the applicant is taking a simple random sample or a targeted sample of cases. We note that, if the applicant obtained a random sample, this sample may not be any more representative of the larger population of cases identified by the lung cancer diagnosis codes listed previously. If the applicant instead non-randomly sampled cases from the larger population, we would like to understand the process used by the applicant to identify this targeted sample. Under either approach, we would request information on how a sampling of cases from the greater population is more representative of potential amivantamab patients.

We are inviting public comments on whether amivantamab meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that amivantamab represents a substantial clinical improvement over existing technologies. The applicant asserted several claims of substantial clinical improvement for amivantamab: (1) Amivantamab is anticipated to be the first therapy to treat the metastatic NSCLC with exon 20 insertion mutations for patients whose disease has progressed on or after platinum-based chemotherapy; (2) the objective response rate (ORR) was higher than what would be expected with chemotherapy or immunotherapy; (3) a clinical benefit rate higher than what would be expected with chemotherapy or immunotherapy; (4) a duration of response higher than what would be expected with chemotherapy or immunotherapy; (5) the median progression free survival was higher than what would be expected with chemotherapy or immunotherapy; and (6) the incidence and severity of diarrhea was lower than what would be expected with any oral EGFR inhibitor.

The applicant stated that patients with NSCLC and EGFR exon 20 insertion mutations have a form of disease that is generally insensitive to available EGFR TKI treatments and, as a result, carries a worse prognosis compared to patients with more common EGFR mutations.[34] Per the applicant, the current standard of care for the initial treatment of exon 20 insertion metastatic NSCLC is platinum-based chemotherapy;[35] and, after a patient with EGFR exon 20 insertion metastatic NSCLC disease progresses on or during platinum-based chemotherapy, there is no standard of care. The applicant stated there are currently no FDA-approved targeted therapies for patients with lung cancer who have EGFR exon 20 insertion mutations.[36] The applicant cited an analysis of the Flatiron Health database, which includes electronic health data records from over 265 cancer clinics representing over 2 million active US cancer patients, that found prescribers use a wide variety of treatment strategies, all of which have an unclear role in the second-line treatment of exon 20 insertion mutated metastatic NSCLC or are known to be ineffective and/or have potential tolerability issues.[37] Specifically, the analysis showed that in the second-line treatment of exon 20 insertion metastatic NSCLC, approximately 33 percent of patients received single-agent immunotherapy, 14.1 percent received an EGFR-targeting oral agent, 5.9 percent received chemoimmunotherapy combination, 5.9 percent received chemotherapy with a VEGF inhibitor, 5.9 percent received a clinical study drug, and the remainder received a variety of single-agent chemotherapies or other regimens. The applicant stated this re-iterates the lack of an accepted standard of care for the second-line treatment of exon 20 insertion metastatic NSCLC and thus underscores the unmet need of these patients. According to the applicant, based on the Breakthrough Therapy designation for amivantamab, it is anticipated that amivantamab's first expected approval will be for the second-line treatment of exon 20 insertion metastatic NSCLC.

The applicant provided three references to support a finding of substantial clinical improvement for amivantamab as well as some supplementary information in the application itself. The first reference was a conference presentation given at the 2019 Annual Meeting of the Society for Clinical Oncology titled ''JNJ–61186372 (JNJ–372), an EGFR-cMet bispecific antibody, in EGFR-driven advanced non-small cell lung cancer (NSCLC)'' by Haura et al. The second was a poster presented at the 2020 Annual Meeting of the American Society for Clinical Oncology titled ''Amivantamab (JNJ–61186372), an anti-EGFR–MET bispecific antibody, in patients with EGFR Exon 20 insertion (Exon20ins)-mutated non-small cell lung cancer (NSCLC)'' by Park et al. The third was a conference presentation given in January 2021 at the World Conference on Lung Cancer titled ''Amivantamab in Post-platinum EGFR Exon 20 Insertion Mutant Non-small Cell Lung Cancer'' by Sabari et al.

These three references all describe the ongoing Phase 1 trial titled ''A Phase 1, First-in-Human, Open-Label, Dose Escalation Study of JNJ–61186372, a Human Bispecific EGFR and cMet Antibody, in Subjects With Advanced Non-Small Cell Lung Cancer'' (*https://clinicaltrials.gov/ct2/show/NCT02609776*). This open label, multicenter, first-in-human study, also known as ''CHRYSALIS,'' consists of two parts.[38] Part 1 was a dose escalation study used to establish the recommended Phase 2 dosing regimen.[39] Part 2 was a dose expansion study to assess safety and efficacy at the recommended Phase 2 dosing regimen.[40] The primary efficacy endpoint was the overall response rate per Response Evaluation Criteria in Solid Tumors v1.1.[41] Key secondary endpoints included clinical benefit rate (CBR), duration of response (DOR), progression-free survival (PFS), and overall survival (OS).[42]

Key eligibility criteria for the post-platinum population of patients enrolled in the study included: Metastatic/unresectable NSCLC, EGFR exon 20 insertion mutation, and progression on platinum-based chemotherapy.[43] Patients received the recommended Phase 2 dose of 1050 mg (1400 mg for patients ≥80 kg) amivantamab intravenously once weekly for the first cycle and biweekly thereafter.[44] The safety population

(N=114) included all post-platinum exon 20 ins patients who received amivantamab at the recommended Phase 2 dose, and the response-evaluable population (n=81) included post-platinum exon 20 ins patients who had at least three disease assessments or had discontinued, progressed, or died prior to the third post-baseline assessment at the time of clinical cut-off.[45]

In the efficacy population, the median age was 62.[46] In addition, 59 percent of the patients were female, 49 percent of the patients were Asian, and 47 percent had a history of smoking.[47] Median time from initial diagnosis was 17 months with a range of 1–130 months.[48] All patients, by definition, had a prior history of platinum-based chemotherapy while 46 percent had prior immuno-oncology therapy and 25 percent had a history of EGFR TKI treatment.[49]

In the safety population, 98 percent of patients experienced a treatment-related adverse event.[50] Of these, 16 percent were Grade 3 or higher, 9 percent were serious, 4 percent led to discontinuation, 13 percent led to dose reduction, and 21 percent led to dose interruption.[51] Of note, 2 percent discontinued due to rash and 10 percent had treatment-related diarrhea with 8.5 percent at grade 1–2 and 3.5 percent at grade 3.[52]

The applicant stated that preliminary safety results from the CHRYSALIS trial presented at the 2020 ASCO meeting appear to demonstrate that amivantamab has a manageable safety profile, with 60% of adverse events at grade 1 to 2.[53] Per the applicant, this appears to be an improvement relative to the types and frequency of adverse events reported for platinum based chemotherapies overall in advanced NSCLC, with over half of patients reporting adverse events of grade 3 to 5, such as neutropenia, nausea, and vomiting.[54] The applicant noted the best tolerated EGFR-targeting oral agent osimertinib was associated with a rate of discontinuation due to adverse events of 13 percent in the phase 3 FLAURA study.[55] In addition, the applicant noted osimertinib was associated with a rate of any grade diarrhea of 58 percent with 2 percent of patients having grade 3 or higher in this study.[56] In the same phase 3 FLAURA study, the applicant noted the comparator arm (gefitinib or erlotinib) was associated with a 57 percent incidence of any grade diarrhea with 2 percent of patients experiencing grade 3 or higher.

Regarding efficacy, in the Sabari et al reference, a blinded independent central review found an ORR in the efficacy population of 40 percent (95 percent CI 29–51) and a median DOR of 11.1 months (95 percent CI 6.9-not reached).[57] Patients experienced a complete response in 4 percent of cases, partial response in 36 percent of cases, stable disease in 48 percent of cases, progressive disease in 10 percent of cases, and one percent of patients was not evaluable.[58] Finally, the CBR (defined as complete response, partial response, or stable disease for at least two disease assessments) was 74 percent (95 percent CI 63–83).[59] The median patient follow-up in this most recent analysis was 9.7 months (range 1.1–29.3). Of note, 47 percent of patients remained on treatment at time of data cutoff and 63 percent had responses of at least six months.[60] The median PFS was 8.3 months (95 percent CI 6.5–10.9), and the median overall survival was 22.8 months (95 percent CI 14.6-not reached).[61]

The applicant stated that, while direct comparison between therapies cannot be definitively made in the absence of comparative trials, amivantamab results appear promising and numerically better than those expected with current therapies (chemotherapy, immunotherapy, chemoimmunotherapy combination, or oral EGFR tyrosine kinase inhibitors) based on available data. The applicant stated platinum-based chemotherapy has been associated with a median progression free survival of 5.1 to 6.0 months in patients with exon 20 T790m mutations–the most common mutation observed following resistance to small molecule TKI inhibitors commonly used in advanced EGFR mutation positive NSCLC.[62] The applicant stated that oral EGFR tyrosine kinase inhibitors (for example, erlotinib, gefitinib, afatinib, dacomitinib, osimertinib) and immunotherapies are also used to treat patients with exon 20 insertion metastatic NSCLC but generally have limited efficacy as exon 20 insertion mutations have been associated with resistance to EGFR tyrosine kinase inhibitors.[63] The applicant stated most immunotherapy and chemoimmunotherapy studies have excluded patients with EGFR mutation because single-agent immunotherapies have very limited efficacy in patients with EGFR-mutated NSCLC.

The applicant provided the following table 1, which outlines median progression free survival (mPFS) and response rate (ORR) data among patients with exon 20 insertion mutation for amivantamab and some of the currently existing therapies. The applicant noted this table is intended to provide general information about individual therapies and is not intended for making direct comparisons between therapies as differences between study populations, follow-up time, prior treatments, and other factors may exist.

	Chemotherapy	Afatinib	Osimertinib	Erlotinib/Gefitinib	Amivantamab
mPFS	5.7 months	2.7 months	3.7 months	< 3 months	8.6 months
ORR	29%	9%	6%	8% - 27%	41%

Finally, the applicant cited an analysis presented at the 2020 American Society of Clinical Oncology (ASCO) Annual Meeting, which found patients experienced a median ORR of 13% and PFS of 3.5 months when receiving a wide variety of different therapies, including immunotherapies, chemoimmunotherapies, EGFR-targeting TKIs, and other chemotherapy regimens as second-line treatment.[64]

After review of the information provided by the applicant, we have the following concerns regarding whether the technology meets the substantial clinical improvement criterion. Currently, results provided by the applicant are based on an ongoing Phase 1 trial. We are concerned that these are potentially partial results, from which end conclusions may not be drawn, and also about the potential for overestimating treatment effects when trials stop early or report interim results. We further note that the only study cited by the application to establish substantial clinical improvement is a single-armed study assessing the safety and efficacy of amivantamab in the target population. As noted by the applicant, no formal comparisons to other therapies have been made. Without the ability to control for factors such as study design, patient characteristics, etc., we may be unable to determine whether any differences seen are the result of amivantamab's potentially superior efficacy or confounding variables. We also note that the single-arm study design results in an inability to distinguish between the effect of amivantamab treatment, a placebo effect, and the effect of natural course of the disease.

We are inviting public comments on whether amivantamab meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for amivantamab.

c. Breyanzi® (lisocabtagene maraleucel)

Juno Therapeutics, a Bristol-Myers Squibb Company, submitted an application for new technology add-on payment for FY 2022 for Breyanzi®. Breyanzi® is a CD19-directed, autologous chimeric antigen receptor (CAR) T-cell immunotherapy that is comprised of individually formulated CD8 (killer) and CD4 (helper) CAR T-cells indicated for the treatment of adult patients with relapsed or refractory (r/r) large B-cell lymphoma after at least two prior therapies. We note that Juno Therapeutics previously submitted an application for new technology add-on payments for Breyanzi® for FY 2021, as summarized in the FY 2021 IPPS/LTCH PPS proposed rule, under the name lisocabtagene maraleucel (85 FR 32647–32652).

According to the National Comprehensive Cancer Network, Diffuse Large B-cell lymphoma (DLBCL) is the most common type of Non-Hodgkin's Lymphoma (NHL) in the U.S. and worldwide, accounting for nearly 30% of newly diagnosed cases of B-cell NHL in U.S.[65] DLBCL is characterized by spreading of B-cells through the body that have either arrived de novo or by the transformation from indolent lymphoma.

According to the applicant, the standard-of-care, first-line immune-chemotherapy for DLBCL includes regimens such as cyclophosphamide, doxorubicin, vincristine, and prednisone plus rituximab (R–CHOP).[66] These regimens result in long-lasting remission in more than 50% of patients.[67] However, approximately 10% to 15% of patients will have primary refractory disease (that is, nonresponse or relapse within 3 months of first-line therapy), and an additional 20% to 25% will relapse following an initial response to therapy.[68] Patients with relapses of aggressive B-cell lymphomas are believed to have a poor prognosis because of potential treatment resistance and rapid tumor growth, with only about 30% to 40% responding to salvage chemotherapy (for example, R–ICE, DHAP, or Gem-ox) followed by high-dose therapy and autologous stem cell transplantation for patients demonstrating chemotherapy-sensitive disease.[69] [70] Among patients eligible to undergo autologous stem cell transplantation (ASCT), only 50% will achieve a remission adequate to proceed to ASCT, and approximately 50% will relapse after transplantation.[71] The applicant also noted that transplant eligibility is also restricted based on age and tolerance to high dose chemotherapy and thus excludes a moderate subset of patients with r/r DLBCL.

Additionally, the applicant explained that the available therapies for 3L+ large B-cell lymphoma include the following:

- CD19-directed genetically modified autologous CAR T-cell immunotherapy axicabtagene ciloleucel (YESCARTA®), approved in October 2017 for the treatment of adult patients with r/r large B-cell lymphoma after two or more lines of systemic therapy, including DLBCL not otherwise specified, primary mediastinal large B-cell lymphoma, high grade B-cell lymphoma, and DLBCL arising from follicular lymphoma (FL).[72]
- CAR T-cell therapy tisagenlecluecel (KYMRIAH®), approved in May 2018, for the treatment of adult patients with r/r large B-cell lymphoma after two or more lines of systemic therapy, including DLBCL not otherwise specified, high grade B-cell lymphoma, and DLBCL arising from FL.[73]
- Programmed death receptor-1 (PD–1)-blocking antibody (KEYTRUDA®), approved in 2018, for the treatment of adult and pediatric patients with refractory primary mediastinal B-cell lymphoma (PMBCL), or who have relapsed after two or more prior lines of therapy.[74]
- CD79b-directed antibody-drug conjugate polatuzumab vedotin (POLIVY®), in combination with bendamustine and rituximab, approved in 2019, for the treatment of adult patients with r/r DLBCL, not otherwise specified, after at least two prior therapies.

[71] *Ibid*

[72] YESCARTA®'s approval was based on a single arm study (ZUMA–1) demonstrating an IRC-assessed ORR of 72%, CR of 51%, and an estimated median DOR of 9.2 months in 101 subjects included in the modified intent-to-treat (mITT population).

[73] KYMRIAH®'s approval was based on a single-arm study (JULIET) demonstrating an ORR of 50% and a CR rate of 32% in 68 efficacy-evaluable subjects. A median DOR was not reached with a median follow-up of 9.4 months.

[74] KEYTRUDA is not recommended for treatment of patients with PMBCL who require urgent cytoreductive therapy. Keytruda USPI (2019).

According to the applicant, despite the availability of these therapies, r/r large B-cell lymphoma remains a major cause of morbidity and mortality due to the aggressive disease course. The applicant noted that the safety profiles of these therapies exclude many r/r large B-cell lymphoma patients from being able to undergo treatment with these therapies.[75]

With respect to the newness criterion, the applicant submitted a BLA for Breyanzi® in October 2019, and was approved by FDA on February 5, 2021. Breyanzi® was granted Breakthrough Therapy Designation (BTD) on December 15, 2016 and Regenerative Medicine Advanced Therapy (RMAT) designation on October 20, 2017, for the treatment of patients with r/r aggressive large B-cell NHL, including DLBCL, not otherwise specified (DLBCL NOS; de novo or transformed from indolent lymphoma), primary mediastinal B-cell lymphoma (PMBCL), or follicular lymphoma Grade 3B (FL3B)). Breyanzi® is a CD19-directed genetically modified autologous T cell immunotherapy indicated for the treatment of adult patients with relapsed or refractory large B-cell lymphoma after two or more lines of systemic therapy, including diffuse large B-cell lymphoma (DLBCL) not otherwise specified (including DLBCL arising from indolent lymphoma), high-grade B-cell lymphoma, primary mediastinal large B-cell lymphoma, and follicular lymphoma grade 3B. Breyanzi® is not indicated for the treatment of patients with primary central nervous system lymphoma. We note that effective October 1, 2021 the following ICD–10–PCS codes may be used to uniquely describe procedures involving the infusion of Breyanzi®: XW033N7 (Introduction of lisocabtagene maraleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7) and XW043N7 (Introduction of lisocabtagene maraleucel immunotherapy into central vein, percutaneous approach, new technology group 7). The applicant also submitted a request for a new HCPCS code, which will uniquely describe procedures involving the use of Breyanzi®. The applicant noted in their application that Breyanzi® would likely map to the same MS–DRG as other CAR T-cell therapies, MS–DRG 018 (Chimeric Antigen Receptor (CAR) T-cell Immunotherapy).

As previously discussed, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome, the applicant described two ways in which it believes the mechanism of action for Breyanzi® differs from previously approved therapies for DLBCL. First, the applicant described the therapy as being comprised of individually formulated cryopreserved patient-specific helper (CD4) and killer (CD8) CAR T-cells in suspension that are administered as a defined composition of CAR-positive viable T-cells (from individually formulated CD8 and CD4 components). The applicant stated that the therapy involves a different mechanism of action from other CAR–T cell therapies because the CD4 and CD8 T-cells are purified and cultured separately to maintain compositional control of each cell type. Furthermore, during culture, each cell type is separately modified to have the CAR on the cell surface, expanded and quantified, and frozen in two separate cell suspensions. The applicant then described how Breyanzi® is infused with the same target dose of CD4 and CD8 CAR T-cells for every patient. The applicant asserted that because Breyanzi® controls the same dosage for both CD4 and CD8, it differs from other CAR T-cell therapies for DLBCL and could potentially provide for higher safety and efficacy; the applicant stated that CAR T-cell therapies that do not control for CD8 CAR T-cell dosage have demonstrated higher rates of severe and life-threatening toxicities, such as cytokine release syndrome (CRS) and neurotoxicity (NT).

The second feature the applicant described as distinguishing Breyanzi®'s mechanism of action from existing CD19-directed CAR T-cell therapies was the presence of an EGFRt cell surface tag. The applicant explained that the EGFRt cell surface tag could hypothetically be targeted for CAR T-cell clearance by separately administering cetuximab, a monoclonal antibody. According to the applicant, if the patient was separately administered cetuximab, the presence of the EGFRt cell surface tag within Breyanzi® would allow cetuximba to bind to the CAR T-cells and clear the cells from the patient. The applicant highlighted studies that showed that persistent functional CD19-directed CAR T-cells in patients caused sustained depletion of a patient's normal B-cells that expressed CD19, resulting in hypogammaglobulinemia and an increased risk of life-threatening or chronic infections.[76] The applicant further explained that such prolonged low levels of normal B-cells could place a patient at risk of life-threatening or chronic infections. According to the applicant, the ability to deplete CAR T-cells, via the administration of cetuximab, when a patient achieves a long-term remission could hypothetically allow recovery of normal B-cells and potentially reduce the risk of life-threatening or chronic infections. The applicant noted that experiments in a laboratory setting showed that targeting EGFRt with the monoclonal antibody cetuximab eliminated CAR T-cells expressing the EGFRt marker, which resulted in long-term reversal of B-cell aplasia in mice.[77] However, the applicant noted that this mechanism of CAR T-cell clearance, via administration of cetuximab and EGFRt cell surface tags/markers, has not been tested in humans, including patients treated with Breyanzi®.

With respect to the second criterion, whether a product is assigned to the same or a different MS–DRG, the applicant acknowledged that the ICD–10–PCS procedure codes used to uniquely identify procedures involving the administration of Breyanzi® XW033N7 (Introduction of lisocabtagene maraleucel Immunotherapy into peripheral vein, percutaneous approach, new technology group 7) and XW043N7 (Introduction of lisocabtagene maraleucel Immunotherapy into central vein, percutaneous approach, new technology group 7) are assigned to MS–DRG 018 (Chimeric Antigen Receptor (CAR) T-cell Immunotherapy). The applicant has not made a request for the technology to map to a new or different MS–DRG for FY 2022.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, according to the applicant, Breyanzi® fills an unmet need in the treatment of large B-cell lymphoma because Breyanzi® would be indicated as a third-line treatment option for patients with r/r DLBCL, who cannot be treated with existing CAR T-

[75] Smith SD, Reddy P, Sokolova A, et al., Eligibility for CAR T-cell therapy: An analysis of selection criteria and survival outcomes in chemorefractory DLBCL, Am. J. Hematol. 2019; E119: 1–4 (Smith, 2019).

[76] Kalos M, Levine BL, Porter DL, et al., T Cells with Chimeric Antigen Receptors Have Potent Antitumor Effects and Can Establish Memory in Patients with Advanced Leukemia, Sci Transl Med. 2011; 3(95): 1–21 (Kalos, 2011).

[77] Paszkiewicz PJ, Frable SP, Srivastava S, et al., Targeted antibody-mediated depletion of murine CD19 CAR T cells permanently reverses B cell aplasia, J Clin Invest. 2016; 126(11): 4262–4272 (Paszkiewicz, 2016).

cell therapies. The applicant asserted that Breyanzi® would be able to treat these patients that present with uncommon subtypes of DLBCL including, PMBCL, FL3B, and DLBCL transformed from indolent lymphoma from other follicular lymphoma, elderly patients (≥ 65 years old), patients with secondary CNS involvement by lymphoma, and those with moderate renal or cardiac comorbidities. The applicant asserted that these patient populations were excluded from registrational trials for YESCARTA® and KYMRIAH®, and therefore represent an unmet patient need.

Regarding newness, we are concerned whether a differing production and/or dosage represents a different mechanism of action as compared to previously FDA-approved CAR T-cell therapies. We are also concerned about whether the existence of an EGFRt cell surface tag equates to a new mechanism of action given that in order to activate this cell surface tag, an additional medication, cetuximab, which targets the CAR T-cells for clearance, would be needed. We also express concern that, based on our understanding, the presence of the EGFRt cell surface tag is a potential way to treat an adverse event of the Breyanzi® therapy and is not critical to the way the drug treats the underlying disease. We note that the applicant referenced that while this EGFRt cell surface tag is included within the Breyanzi® compound, it remains dormant without activation by cetuximab. Finally, the applicant noted that Breyanzi® has been shown safe and effective for patient populations excluded from registrational trials for YESCARTA® and KYMRIAH®, including patients with uncommon subtypes of large B-cell lymphoma, including PMBCL, FL3B, and DLBCL transformed from indolent lymphoma other than FL, elderly patients (≥ 65 years old), patients with secondary CNS involvement by lymphoma and those with moderate renal or cardiac comorbidities.[78] We note that the FDA label for YESCARTA® and KYMRIAH® does not appear to specifically exclude these patient populations or NHL subtypes. As such, it is unclear whether Breyanzi® would in fact treat a patient population different from other CAR T-cell therapies that treat patients with DLBCL.

We are inviting public comments on whether Breyanzi® is substantially similar to other technologies and whether Breyanzi® meets the newness criterion.

With regard to the cost criterion, the applicant searched the FY 2019 MedPAR correction notice (December 1, 2020) data file to identify potential cases representing patients who may be eligible for treatment using Breyanzi®. The applicant identified claims that reported an ICD–10–CM diagnosis code of: C83.30 (DLBCL, unspecified site); C83.31 (DLBCL, lymph nodes of head, face and neck); C83.32 (DLBCL, intrathoracic lymph nodes); C83.33 (DLBCL, intra-abdominal lymph nodes); C83.34 (DLBCL, lymph nodes of axilla and upper limb); C83.35 (DLBCL, lymph nodes of inquinal region and lower limb); C83.36 (DLBCL, intrapelvic lymph nodes); C83.37 (DLBCL, spleen); or C83.38 (DLBCL, lymph nodes of multiple sites) in one of the first five diagnosis code positions on the claim. The applicant excluded claims if they had one or more diagnoses from the list below because these conditions would preclude use of Breyanzi®.

BILLING CODE 4120–01–P

ICD-10-CM Code	Code Description
C72	Malignant neoplasm of spinal cord, cranial nerves and other parts of central nervous system
C72.0	Malignant neoplasm of spinal cord
C72.1	Malignant neoplasm of cauda equina
C72.2	Malignant neoplasm of olfactory nerve
C72.20	Malignant neoplasm of unspecified olfactory nerve
C72.21	Malignant neoplasm of right olfactory nerve
C72.22	Malignant neoplasm of left olfactory nerve

BILLING CODE 4120–01–C

However, the applicant noted that the aforementioned C83.XX ICD–10–CM codes do not differentiate r/r patients from the broader DLBCL population. A clinical literature search completed by the applicant found that the r/r population makes up one-fourth of the DLBCL population, but since r/r patients typically have higher inpatient costs the applicant selected 19.36 percent of the cases with the highest total charges for their cost analysis. Applying the previously mentioned parameters, the applicant found a total of 991 cases mapped to 12 MS–DRGs.

The applicant stated that the use of Breyanzi®'s therapy would replace chemotherapy or other drug therapies, including other CAR T-cell therapies. Because of this, the applicant stated they removed all charges in the drug cost center since it was not possible to differentiate between different drugs on inpatient claims. The standardized charges per case were then calculated using the 2019 IPPS/LTCH PPS final rule Impact file and the 2-year inflation factor of 13.2 percent (1.3218) was applied. Finally, to determine the charges for Breyanzi®, the applicant used the inverse of a simulated alternative cost-to-charge ratio (CCR) specifically for CAR T–CELL therapies to account for CAR T-cell therapies' higher costs compared to other drugs. To determine this alternative CCR for CAR T-cell therapies, the applicant referred to the FY 2021 IPPS final rule AOR/BOR file and calculated an alternative markup percentage by dividing the AOR drug charges within MS–DRG 018 by the number of cases to determine a per case drug charge. The applicant then divided the drug charges per case by $373,000, the acquisition cost of YESCARTA and KYMRIAH, the CAR T-cell products used in those claims, to arrive at a CCR of 0.295. The applicant noted that the cost of Breyanzi® had not yet been determined at the time of application. However, for the purposes of its cost analysis, the applicant assumed the per-patient cost to the hospital will be $373,000. Based on the FY 2021 IPPS/LTCH PPS final rule correction notice data file thresholds for FY 2022, the applicant calculated a final inflated average case-weighted standardized charge per case of $1,377,616 which exceeded the MS–DRG 018 average case-weighted threshold of $1,251,127 by $126,489. Therefore, the applicant stated that Breyanzi® met the cost criterion.

As noted in previous discussions, the submitted costs for CAR T-cell therapies vary widely due to differences in provider billing and charging practices for this therapy. Therefore, with regard to the use of this data for purposes of calculating a CAR T-cell CCR, we are uncertain how representative this data is for use in the applicant's cost analyses given this potential for variability.

We continue to be interested in public comments regarding the eligibility of CAR T-cell technologies for new technology add-on payments when assigned to MS–DRG 018. As we have noted in prior rulemaking with regard to the CAR T-cell therapies (83 FR 41172 and 85 FR 58603 through 58608), if a new MS–DRG were to be created, then consistent with section 1886(d)(5)(K)(ix) of the Act, there may no longer be a need for a new technology add-on payment under section 1886(d)(5)(K)(ii)(III) of the Act. We welcome comment on this issue.

We invite public comment on whether Breyanzi® meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that Breyanzi® represents a substantial clinical improvement over existing technologies because: (1) The totality of the circumstances regarding Breyanzi®'s clinical efficacy, safety, and data make clear that Breyanzi® substantially improves, relative to services or technologies previously available, the treatment of Medicare beneficiaries with R/R NHL; (2) Breyanzi® offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments; (3) Breyanzi® has, overall, an improved safety profile compared to YESCARTA and KYMRIAH; (4) Breyanzi® has a comparable or superior effectiveness compared to existing therapies; and (5) Breyanzi®'s patient population in its registrational study more accurately reflects real-world NHL patients compared to the studies of currently available CAR T-cell therapies.

The applicant asserts that the totality of the clinical efficacy and safety data from the TRANSCEND NHL 001 trial, which is a prospective, single arm, multicenter study of Breyanzi® in patients with r/r aggressive B-cell NHL, and the supportive safety data from the Breyanzi® clinical studies included in their Biologics License Application (BLA) submission demonstrate that Breyanzi® has equal or better efficacy and a better safety profile in a broad R/R patient population that better approximates the real world large B-cell lymphoma patient population—a population that the applicant asserted includes NHL subtypes not studied or approved for treatment with current approved or conditionally approved agents.

The applicant shared the results of the Phase I TRANSCEND NHL 001 trial, which was a prospective, single arm, multicenter study of lisocabtagene maraleucel in patients with relapsed/refractory aggressive B-cell NHL. The applicant noted that TRANSCEND NHL 001 included subjects with the average age of 63 years with 111 subjects (41%) over 65 years of age and 27 (10%) subjects older than 75 years of age. These patients also failed previous therapies. Of the total number of subjects studied (efficacy: n=256; safety: n=269), 137 subjects (51%) had DLBCL, 60 (22%) had DLBCL transformed from FL, 18 (7%) had DLBCL transformed other indolent lymphomas, 36 patients (13%) had high grade lymphoma, 15 (6%) had PMBCL and 3 (1%) had FL3B.[79] Additionally, the applicant explained that TRANSCEND NHL 001 was more inclusive, compared to the registrational trials for KYMRIAH® and YESCARTA®, of Medicare aged patients with comorbidities and NHL disease subtypes seen in the real world presentation of the disease. To support this, the applicant referenced that within this study, between 40% to 50% of subjects studied had cardiac ejection fraction, 3% had secondary CNS lymphoma, 51 patients (19%) had a creatinine clearance between 30–60 mL/min and 39 patients (14.6%) had grade ≥ 3 cytopenias. Furthermore, the applicant noted that 51 patients (19%) had decreased renal function and 13 patients (4.9%) had decreased cardiac function. The applicant stated that the TRANSCEND NHL 001 study showcased that the patient population treated during the study better reflected the real world large B-cell lymphoma patient population, a population that the applicant asserted included NHL subtypes not studied or approved for treatment with currently approved or conditionally approved agents, while providing similar safety and efficacy. The applicant contended that these high-unmet need large B-cell lymphoma subsets included patients with DLBCL transformed from rare indolent lymphomas other than FL, patients with FL3B, patients 65 years of age and older, as well as patients with moderate comorbidities of renal and cardiac insufficiency.

The applicant further explained that Breyanzi® provided improved effectiveness as compared to existing therapies. Patients with aggressive large B-cell NHL who have failed at least 2 prior therapies or SCT are treated with combinations of agents or monotherapy based on institutional preferences, but there is no standard of care for salvage therapies beyond first treatment therapy.[80] The applicant noted that commonly used salvage therapies (non-CAR T-cell therapies) for relapsed, large B-cell lymphoma demonstrated objective response rates (ORRs) in the range of 12% to 46% and complete response (CR) rates of 6% to 38%. Among the patients who did achieve a response, the median duration of response (DOR) ranges from approximately 6 to 17 months and median overall survival was generally less than 12 months.[81 82 83 84 85 86 87] Comparatively, TRANSCEND NHL 001, which provided subjects with Breyanzi®, met its primary endpoint of Independent Review Committee (IRC)-assessed ORR in adult patients with r/r large lymphoma after at least 2 prior therapies, as reported by the applicant. In the 256 efficacy evaluable patients, the ORR was 73% (95% confidence interval (CI): 67.0% to 78.3%), and the CR rate was 53% (95% CI: 46.6% to 59.2%). With a median follow-up of 10.8 months, the median DOR per IRC assessment was 13.3 months and the median DOR for CR was not reached. By comparison, the applicant summarized that YESCARTA®, as demonstrated in the Phase I–II ZUMA–1 study (see the FY 2019 IPPS/LTCH PPS final rule 83 FR 41295 for a description of this study), had an ORR of 72.0% (95% confidence interval (CI: 62.0% to 81.0%)). Also, according to the applicant, KYMRIAH®, as demonstrated by the Phase II JULIET study (see the FY 2019 IPPS/LTCH PPS final rule 83 FR 41293 for a description of this study), had an ORR of 50.0% (95% confidence interval (CI: 38.0% to 62.0%)). The applicant contended that the results for Breyanzi® (ORR of 73% (95% confidence interval (CI): 67.0% to 78.3%), and the CR rate of 53% (95% CI: 46.6% to 59.2%) were observed across all subgroups tested, including

[86] Van Den Neste E, Schmitz N, Mounier N, et al., Outcome of patients with relapsed diffuse large B-cell lymphoma who fail second-line salvage regimens in the International CORAL study, Bone Marrow Transplantation. 2016; 51: 51–57 (Van Den Neste, 2016).

[87] Wang M, Fowler N, Wagner-Bartak N, et al., Oral lenalidomide with rituximab in relapsed or refractory diffuse large cell, follicular and transformed lymphoma: a phase II clinical trial, Leukemia. 2013; 27: 1902–1909 (Wang, 2013).

elderly subjects, those with high burden disease or high baseline inflammatory biomarkers, those requiring anti-lymphoma therapy for disease control, as well as rare patient populations with a high unmet medical need (for example, PMBCL, DLBCL transformed from indolent lymphoma other than FL, and FL3B). The applicant contended that this data supports that Breyanzi® demonstrates comparable or superior effectiveness compared to existing therapies for patients with r/r large B-cell NHL.[88] [89]

Furthermore, the applicant stated that Breyanzi® had an improved safety profile in comparison to YESCARTA® and KYMRIAH®. The applicant stated that both of these FDA-approved CAR T-cell therapies had higher rates of toxicity as compared to Breyanzi®. In the TRANSCEND NHL 001 registrational study (n=268), 42% and 2% of subjects developed all-grade and Grade > 3 CRS, respectively, and 30% and 10% developed all-grade and Grade > 3 NT. The applicant compared these results to the results of the JULIET study as found in KYMRIAH's® prescribing information and summarized that KYMRIAH® had higher rates of all-grade and Grade > 3 CRS (74% and 23%, respectively) and all-grade and Grade > 3 NT (58% and 18%, respectively). The applicant provided the same comparison of the toxicity results of Breyanzi® to the results showcased in the ZUMA–1 study featuring YESCARTA® as found in YESCARTA®'s prescribing information and summarized that YESCARTA® had higher rates of all-grade and Grade > 3 CRS (94% and 13%, respectively) and all-grade and Grade > 3 NT (87% and 31%, respectively).[90] [91]

After reviewing the information submitted by the applicant as part of its FY 2022 new technology add-on payment application, we are concerned that there are no published studies directly comparing Breyanzi® and the two currently available CAR T-cell therapies for r/r DLBCL, YESCARTA® and KYMRIAH®. Additionally, we are concerned with the lack of long-term data supporting the effectiveness and efficacy of Breyanzi® and whether the lack of long-term data may limit the generalizability of the findings from the TRANSCEND NHL 001 study to the general Medicare population. While there have been no direct comparison studies of Breyanzi®, YESCARTA® and KYMRIAH®, the applicant does provide a comparison of the ORR, CR, PR and DOR across all three CAR T-cell therapies. While we note that Breyanzi® does appear to provide an improved ORR, CR, PR, and DOR compared to the other FDA-approved CAR T-cell therapies based on the data presented by the applicant, we further note that these differences appear to be small in magnitude, between 1–2% for the ORR, CR, and PR. Without a direct comparison of outcomes between these therapies, we are concerned as to whether these differences translate to clinically meaningful differences or improvements. Breyanzi® appears to demonstrate similar patient outcomes to that of YESCARTA® and we question whether the TRANSCEND NHL 001 study is evidence that Breyanzi® is a more effective therapy to treat DLBCL over existing CAR T-cell therapies. Additionally, as previously discussed, the applicant noted that Breyanzi® has been shown safe and effective for patient populations excluded from registrational trials for YESCARTA® and KYMRIAH®. However, it is unclear whether this suggests that Breyanzi® is a treatment option for patients who cannot be treated with these existing CAR T-cell therapies, given that the FDA label for YESCARTA® and KYMRIAH® appears to not specifically exclude these patient populations. Finally, we are concerned that the use of the EGFRt cell surface tag was not activated in patients receiving Breyanzi® to study the impact of clearing these CAR T-cells after remission and that this feature has not yet been tested on humans or in conjunction with patients treated with Breyanzi®. We express concern regarding the safety and efficacy of this feature given its lack of testing.

We are inviting public comments on whether Breyanzi® meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for Breyanzi® or at the New Technology Town Hall meeting.

d. Ciltacabtagene Autoleucel

Janssen Biotech, Inc., submitted an application for new technology add-on payments for ciltacabtagene autoleucel for FY 2022. Ciltacabtagene autoleucel is an autologous chimeric-antigen receptor (CAR) T-cell therapy directed against B cell maturation antigen (BCMA) for the treatment of patients with multiple myeloma.

Ciltacabtagene autoleucel refers to both JNJ–4528, an investigational BCMA-directed CAR T-cell therapy for previously treated patients with multiple myeloma, and LCAR–B38M, the investigational product (ciltacabtagene autoleucel) being studied in China. Both JNJ–4528 and LACAR–B38M are representative of the same CAR T-cell therapy, ciltacabtagene autoleucel. Ciltacabtagene autoleucel has not yet received FDA approval.

Multiple myeloma (MM) is typically characterized by the neoplastic proliferation of plasma cells producing a monoclonal immunoglobulin. The plasma cells proliferate in the bone marrow and can result in extensive skeletal destruction with osteolytic lesions, osteopenia, and/or pathologic fractures. The diagnosis of MM is often suspected because of one (or more) of the following clinical presentations:

- Bone pain with lytic lesions discovered on routine skeletal films or other imaging modalities.
- An increased total serum protein concentration and/or the presence of a monoclonal protein in the urine or serum.
- Systemic signs or symptoms suggestive of malignancy, such as unexplained anemia.
- Hypercalcemia, which is either symptomatic or discovered incidentally.
- Acute renal failure with a bland urinalysis or rarely nephrotic syndrome due to concurrent immunoglobulin light chain (AL) amyloidosis.

It is important to distinguish MM both from other causes of the clinical presentations mentioned previously and from other plasma cell dyscrasias for the purposes of prognosis and treatment.[92] Data from the US Surveillance, Epidemiology, and End Results (SEER) registry estimate 32,000 new cases of MM and 13,000 deaths from MM annually in the U.S. This correlates with an annual incidence of approximately 7 per 100,000 men and women per year. MM is largely a disease of older adults. The median age at diagnosis is 65 to 74 years. MM is also slightly more frequent in men than in women (approximately 1.4:1). MM is associated with substantial morbidity and mortality [93]

[93] Cowan AJ, Allen C, Barac A, Basaleem H, Bensenor I, Curado MP, Foreman K, Gupta R,

Continued

and approximately 25% of patients have a median survival of 2 years or less.[94]

According to the applicant, introduction of new treatment options in the last 2 decades has extended the median survival of multiple myeloma patients. The applicant asserted that the introduction of proteasome inhibitors (PI) (*e.g.,* bortezomib, carfilzomib, and ixazomib), histone deacetylase inhibitors (*e.g.,* panobinostat, vorinostat), immunomodulatory agents (IMiD) (*e.g.,* thalidomide, lenalidomide, and pomalidomide), monoclonal antibodies (daratumumab and elotuzumab), and stem cell transplantation, have allowed numerous therapeutic options for patients with multiple myeloma (Rajkumar 2020). According to the applicant, the National Comprehensive Cancer Network (NCCN) recommended treatment regimen for first-line therapy of multiple myeloma is Bortezomib (a proteosome inhibitor (PI)), lenalidomide (an immunomodulatory agent (IMiD)) and dexamethasone.[95] The strategy of triplet therapies for patients with newly diagnosed multiple myeloma, followed by high-dose chemotherapy and autologous stem-cell transplantation for eligible patients, and subsequently consolidation and maintenance therapy, is the current treatment roadmap for patients.[96] However, despite these treatments, according to the applicant, most patients will relapse after first-line treatment and require further treatment [97] with only 50% survival of relapsed patients after 5 years.[98] [99] As multiple myeloma progresses, each subsequent line of treatment is associated with shorter progression free survival (PFS) and decreased rate, depth, and durability of response and worsening of quality of life.[100] In addition, cumulative and long-term toxicities are often associated with long-term therapy (Ludwig, 2018). Thus, according to the applicant, there remains an ongoing need for additional therapeutic approaches when the disease is resistant to available therapy.

The applicant asserts that relapsed and refractory multiple myeloma (RRMM) constitutes a specific unmet medical need. According to the applicant, patients with r/r disease are defined as those who, having achieved a minor response or better, relapse and then progress while on therapy, or experience progression within 60 days of their last therapy.[101] The introduction of a new class of agents, CD38-targeting monoclonal antibodies (CD38 MoABs), daratumumab and isatuximab, have improved options in r/r patients.[102] The applicant asserts that given these advances, guideline recommendations following first-line therapy are varied, with treatment options including combinations of novel agents with existing standard of care regimens, and triplet and quadruplet regimens, creating a complex treatment landscape.[103] According to the applicant, while triplet regimens should be used as the standard therapy for patients with multiple myeloma, elderly or frail patients may be treated with double regimens.[104] [95] The applicant further states that for patients with RRMM who have received at least 3 prior lines of therapy including a PI, an IMiD and an anti-CD38, there does not exist a standard or consensus for treatment at this time, and often, supportive care/palliative care is the only option.[105]

According to the applicant, multiple myeloma remains incurable and most patients eventually relapse, even with the advent of new treatments.[106] The applicant further states that novel, innovative therapies are needed to improve long-term survival and outcomes. The applicant asserts that CAR T-cell-based therapies offer potential advantages over current therapeutic strategies. According to the applicant, while other therapies require long-term repetitive administration generally until progression of disease, CAR T-cell therapy is a single infusion treatment due to live T-cell expansion in the patient and long-term disease response. The applicant asserts that ciltacabtagene autoleucel is an autologous CAR T-cell therapy directed against B cell maturation antigen (BCMA) for the treatment of patients with multiple myeloma. The applicant states that BCMA, a protein that is highly expressed on myeloma cells [107] and is a member of the tumor necrosis factor (TNF) receptor family, plays a central role in regulating B-cell maturation and differentiation into plasma cells.[108] BCMA is selectively expressed on a subset of B cells (plasma cell neoplasms including myeloma cells) and is more stably expressed specifically on the B cell lineage, compared with key plasma cell marker CD138 which is also expressed on normal fibroblasts and epithelial cells.[109] [110] [111] These expression characteristics, per the applicant, make BCMA an ideal therapeutic target for the treatment of multiple myeloma.[112] [113] Ciltacabtagene autoleucel, according to the applicant, is a unique, structurally differentiated BCMA-targeting chimeric antigen receptor with two distinct BCMA-binding domains that can identify and eliminate myeloma cells.

The applicant asserts that CAR T-cell technology is a form of immunotherapy and is a ''living drug'' that utilizes specially altered T cells, part of the immune system, to fight cancer. A

sample of the patient's T cells are collected from the blood, then modified in a laboratory setting to express a chimeric antigen receptor (CAR).[114] Chimeric antigen receptors are specifically designed receptor proteins that are made up of three distinct features: (1) A target recognition domain (typically derived from a single domain of an antibody) that sits on the cell's exterior, (2) a co-stimulatory domain on the cell's interior that boosts activation, enhances survival and expansion of the modified cells, and (3) an interior stimulatory domain that supports activation and target killing.[115] The binding domain expressed on the surface of T cells gives them the new ability to target a specific protein. When the target is recognized, the intracellular portions of the receptor send signals within the T cells to destroy the target cells. These engineered CAR T-cells are reinfused back into the same patient which enables these specialized T cells to latch onto the target antigen and abolish the tumor cells.

According to the applicant, ciltacabtagene autoleucel is a CAR T-cell immunotherapy designed to recognize myeloma cells and target their destruction. Ciltacabtagene autoleucel's CAR T-cell technology consists of harvesting the patient's own T cells, programming them to express a chimeric antigen receptor that identifies BCMA, a protein highly expressed on the surface of malignant multiple myeloma B-lineage cells, and reinfusing these modified cells back into the patient where they bind to and eliminate myeloma tumor cells. The applicant asserts that, unlike the chimeric antigen receptor design of currently approved CAR T-cell immunotherapies, which are composed of a single-domain antibody (sdAbs), ciltacabtagene autoleucel is composed of two antibody binding domains that allow for high recognition of human BCMA (CD269) and elimination of BCMA expressing myeloma cells. The two distinct BCMA-binding domains, according to the applicant, confer avidity and distinguish ciltacabtagene autoleucel from other BCMA-targeting products. The BCMA binding domains are linked to the receptor's interior costimulatory (4–1BB) and signaling (CD3ζ) domains through a transmembrane linker (CD8a). These intracellular domains are critical components for T cell growth and anti-tumor activity [116] in the body once CAR T-cells are bound to a BCMA target on multiple myeloma cells.

With respect to the newness criterion, according to the applicant, ciltacabtagene autoleucel was granted Breakthrough Therapy designation in December 2019 for the treatment of patients with RRMM who have previously received a PI, an IMiD, and an anti-CD38 antibody. In December 2020, the applicant submitted a Biologic License Application (BLA) with the FDA but at the time of the development of this proposed rule, it has not yet received FDA approval. The applicant stated that procedures involving the administration of ciltacabtagene autoleucel can be reported using the following ICD–10–PCS procedure codes: XW033C3 (Introduction of engineered autologous chimeric antigen receptor t-cell immunotherapy into peripheral vein, percutaneous approach, new technology group 3); and XW043C3 (Introduction of engineered autologous chimeric antigen receptor t-cell immunotherapy into central vein, percutaneous approach, new technology group 3). The applicant noted that there are currently no ICD–10–PCS codes that uniquely identify procedures involving the use of ciltacabtagene autoleucel. The applicant submitted a request for unique ICD–10–PCS codes to describe the administration of ciltacabtagene autoleucel beginning in FY 2022. The applicant also noted that they will submit a request for a Healthcare Common Procedure Coding System (HCPCS) code specific to the administration of ciltacabtagene autoleucel once the product is eligible for such a code.

As previously stated, if a technology meets all three of the substantial similarity criteria as previously described, it would be considered substantially similar to an existing technology and therefore would not be considered ''new'' for purposes of new technology add-on payments.

With respect to whether a product uses the same or a similar mechanism of action when compared to an existing technology to achieve a therapeutic outcome, the applicant asserts that ciltacabtagene autoleucel has a unique mechanism of action because it has two distinct binding domains that confer avidity to the BCMA antigen, a 4–1BB costimulatory domain and a CD3z signaling domain, whereas other CAR T-cell products have only one target binding domain. However, we note that idecabtagnene vicleucel, another CAR T-cell therapy for which an application for new technology add-on payments was submitted for FY 2022, as discussed later in this section, appears to have a mechanism of action that is similar to that of ciltabatagene: A chimeric antigen receptor (CAR)-positive T cell therapy targeting B-cell maturation antigen (BCMA), which is expressed on the surface of normal and malignant plasma cells. The idecabtagene vicleucel CAR construct includes an anti-BCMA scFv-targeting domain for antigen specificity, a transmembrane domain, a CD3-zeta T cell activation domain, and a 4–1BB costimulatory domain. Antigen-specific activation of idecabtagene vicleucel results in CAR-positive T cell proliferation, cytokine secretion, and subsequent cytolytic killing of BCMA-expressing cells.

The applicant also asserts that its mechanism of action differs from Blenrep's mechanism of action. Blenrep is a BCMA-targeting agent indicated in the treatment of RRMM. According to the applicant, Blenrep belongs to the class of antibody-drug conjugates, which are therapies that are essentially composed of a monoclonal antibody linked to a toxic drug. Once the antibody portion of Blenrep recognizes BCMA on multiple myeloma cells, the toxin is released into cells, resulting in cell death. Therefore, according to the applicant, ciltacbtagene autoleucel's mechanism of action differs from Blenrep's. Additionally, the applicant states that there is currently no commercially available CAR T-cell product that binds to the BCMA antigen. Lastly, the applicant provided a list of other currently available treatments for multiple myeloma and a description of their mechanisms of action (Table 1).

TABLE 1: CURRENTLY AVAILABLE TREATMENT OPTIONS FOR MULTIPLE MYELOMA AND DESCRIBED MECHANISM OF ACTION

Treatment Class	Mechanism of Action
Proteasome Inhibitors (PI)[117]	• Interferes with the degradation of proteins within the cells • Myeloma cells are sensitive to this inhibition
Immunomodulatory drugs[117]	• Possess multiple antimyeloma properties including immune modulation, antiangiogenic, anti-inflammatory, and antiproliferative effects
Monoclonal antibodies (MABS)[117]	• Target specific proteins on myeloma cells, which may activate immune responses
Antibody-drug Conjugates[118]	• Antibody that specifically recognizes the BCMA protein — a protein found on the surface of myeloma cells
Histone Deacetylase Inhibitors (HDACIDS)	• Can cause apoptosis of myeloma cells through effects on gene regulation
Corticosteroids[119]	• Can cause apoptosis of myeloma cells
Conventional chemotherapy[120]	• An approach that targets dividing cells
Selective Inhibitor of Nuclear export (SINES)[121]	• Inhibits exportin-1 (XPO) resulting in activation of tumor suppressor proteins, glucocorticoid receptors, and immune response regulators thereby inducing cell cycle arrest and apoptosis

With regard to whether a product is assigned to the same DRG when compared to an existing technology, the applicant expects that cases involving the administration of ciltacabtagene autoleucel will be assigned to the same MS–DRG, MS–DRG 018 (Chimeric Antigen Receptor (CAR) T-cell Immunotherapy), as other CAR T-cell therapies.

With regard to whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population when compared to an existing technology, the applicant asserts that ciltacabtagene autoleucel is indicated for a broader population than other available therapies, specifically multiple myeloma patients having received three prior therapies.

In summary, the applicant asserts that ciltacabtagene autoleucel meets the newness criterion and is not substantially similar to other available therapies because it has a unique mechanism of action with two distinct binding domains that confer avidity to the BCMA antigen, and because it treats a different patient population, RRMM patients who received three prior therapies. However, we note that ciltacabtagene autoleucel may have a similar mechanism of action to that of idecabtagene vicleucel, for which we received an application for new technology add-on payments for FY 2022 for the treatment of adult patients with relapsed or refractory multiple myeloma after four or more prior lines of therapy, including an immunomodulatory agent, a proteasome inhibitor, and an anti-CD38 monoclonal antibody. Per the new technology add-on payment application for idecabtagene vicleucel, the technology's mechanism of action is described as targeting B-cell maturation antigen (BCMA), which is expressed on the surface of normal and malignant plasma cells. The chimeric antigen receptor (CAR) construct includes an anti-BCMA scFv-targeting domain for antigen specificity, a transmembrane domain, a CD3-zeta T cell activation domain, and a 4–1BB costimulatory domain. Antigen-specific activation of idecabtagene vicleucel results in CAR-positive T cell proliferation, cytokine secretion, and subsequent cytolytic killing of BCMA-expressing cells. Because of the potential similarity with the BCMA antigen and other actions, we believe that the mechanism of action for ciltacabtagene autoleucel may be the same or similar to that of idecabtagene vicleucel.

We believe that ciltacabtagene autoleucel may not treat the same or similar patient population as currently existing treatments. However, we believe that ciltacabtagene autoleucel and idecabtagene vicleucel may treat the same or similar disease (RRMM) in the same or similar patient population (patients who have previously received a proteasome inhibitor (PI), and immunomodulatory agent (IMiD) and an anti-CD38 antibody). Accordingly, as it appears that ciltacabtagene autoleucel and idecabtagene vicleucel are purposed to achieve the same therapeutic outcome using the same or similar mechanism of action and would be assigned to the same MS–DRG, we believe that these technologies may be substantially similar to each other such that they should be considered as a single application for purposes of new technology add-on payments. We are interested in information on how these two technologies may differ from each other with respect to the substantial similarity criteria and newness criterion, to inform our analysis of whether idecabtagene vicleucel and ciltacabtagne autoleucel are substantially similar to each other and therefore should be considered as a single application for purposes of new technology add-on payments.

We are inviting public comment on whether ciltacabtagene autoleucel meets the newness criterion, including whether ciltacabtagene autoleucel is substantially similar to idecabtagene vicleucel and whether these technologies should be evaluated as a single technology for purposes of new technology add-on payments.

[121] Podar K, et al. Expert Opin Pharmacother. 2020 Mar;21(4):399–408.

With regard to the cost criterion, the applicant searched the FY 2019 MedPAR correction notice (December 1, 2020) file to identify potential cases representing patients who may be eligible for treatment using Ciltacabtagene autoleucel. In its analysis, the applicant identified a primary cohort to assess whether this therapy met the cost criterion. The following ICD–10–CM diagnosis codes were used to identify claims involving multiple myeloma procedures.

Code	Code Descriptor
C90.0	Multiple myeloma
C90.00	Multiple myeloma not having achieved remission
C90.01	Multiple myeloma in remission
C90.02	Multiple myeloma in relapse

The applicant chose to limit its analysis to MS–DRG 016 (Autologous Bone Marrow Transplant W CC/MCC or T-Cell Immunotherapy) because patients receiving autologous bone marrow transplant (BMT) are generally patients with relapsed or refractory multiple myeloma and are most similar to patients who would be eligible to receive CAR T-cell therapy. The claim search conducted by the applicant resulted in 1,215 claims mapped to MS–DRG 016 using the FY 2019 MedPAR. The applicant determined an average unstandardized case weighted charge per case of $1,237,393. The applicant used the New Technology Threshold for FY 2022 from the FY 2021 IPPS/LTCH PPS final rule for MS–DRG 018. The applicant removed all charges in the drug cost center for the prior technology because, according to the applicant, it is not possible to differentiate between different drugs on inpatient claims. The applicant added that this is likely an overestimate of the charges that would be replaced by the use of ciltacabtagene autoleucel. The applicant then standardized the charges using the FY 2019 final rule impact file. Next, the applicant applied the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges (1.13218). To calculate the charges for the new technology, the applicant used the inverse of a simulated alternative cost-to-charge ratio (CCR) specifically for CAR T cell therapies to account for CAR T-cell therapies' higher costs compared to other drugs and the potential for hospitals' charging practices to differ for these drugs. To determine this alternative CCR for CAR T-cell therapies, the applicant referred to the FY 2021 IPPS final rule AOR/BOR file and calculated an alternative markup percentage by dividing the AOR drug charges within MS–DRG 018 by the number of cases to determine a per case drug charge. The applicant then divided the drug charges per case by $373,000, the acquisition cost of YESCARTA and KYMRIAH, the CAR T-cell products used in those claims, to arrive at a CCR of 0.295. The applicant calculated a final inflated average case-weighted standardized charge per case of $1,646,522, which it stated exceeded the average case-weighted threshold amount of $1,251,126. The applicant stated that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the therapy meets the cost criterion.

As noted in previous discussions, the submitted costs for CAR T-cell therapies vary widely due to differences in provider billing and charging practices for this therapy. Therefore, with regard to the use of this data for purposes of calculating a CAR T-cell CCR, we are uncertain how representative this data is for use in the applicant's cost analyses given this potential for variability.

We continue to be interested in public comments regarding the eligibility of CAR T-cell technologies for new technology add-on payments when assigned to MS–DRG 018. As we have noted in prior rulemaking with regard to the CAR T-cell therapies (83 FR 41172 and 85 FR 58603 through 58608), if a new MS–DRG were to be created, then consistent with section 1886(d)(5)(K)(ix) of the Act, there may no longer be a need for a new technology add-on payment under section 1886(d)(5)(K)(ii)(III) of the Act.

We invite public comment on whether ciltacabtagene autoleucel meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that it believes that ciltacabtagene autoleucel represents a substantial clinical improvement over existing technologies because it: (1) Offers a treatment for a patient population with limited options and continued disease progression, despite having been treated with multiple prior therapies; and (2) provides a significantly improved clinical outcome relative to other therapies, either approved or still under FDA review, used in the relapsed and refractory multiple myeloma setting. With regard to the applicant's assertion that ciltacabtagene autoleucel offers a treatment for a patient population with limited options and continued disease progression, despite having been treated with multiple prior therapies, the applicant cited results from the CARTITUDE–1 STUDY, a Phase 1b/2, open-label, multicenter, multi-national (including US) study to evaluate the safety and efficacy of ciltacabtagene autoleucel in adult patients who have RRMM who have previously received a PI, an IMiD, and an anti-CD38 antibody. The applicant asserts that ciltacabtagene autoleucel was granted Breakthrough Therapy designation for patients who have RRMM who have previously received a PI, an IMiD, and an anti-CD38 antibody, based on data from the Phase1b/2 CARTITUDE–1 study. One hundred thirteen patients were enrolled in the study. Sixteen patients discontinued the study, including 9 patients who died due to progressive disease. Ninety-seven patients received ciltacabtagene autoleucel. The Phase 1b portion of the study included 29 of the 97 patients.

Two patients died during the study: one due to CRS and one due to acute myeloid leukemia (not treatment-related). Twenty-four of the remaining patients were ongoing in the Phase 1b dose confirmation period, with an additional 59 patients ongoing in the Phase 2 portion. The primary objective of the Phase 1b portion of the trial was to confirm the safety of the selected dose based on the data from the ongoing Phase 1 trial in China (Legend-2), as discussed later in this section. The primary objective of the Phase 2 portion of the trial is to evaluate the efficacy of ciltacabtagene autoleucel.

The applicant asserts that at median follow-up of 12.4 months, ciltacabtagene autoleucel led to a 97% overall response rate (ORR) in all 97 study patients who

received ciltacabtagene autoleucel.[122] The applicant asserts that this unprecedented overall response rate of (97%), represents early, deep, and durable responses in all patients, minimal residual disease negativity (meaning minimal residual cancer cells after treatment to the -nth degree) in the majority of patients who achieved a complete response (CR) and a very manageable toxicity profile. The applicant provided a comparison of the ORR in phase 1 studies for other therapies used to treat RRMM and noted the following: idecabtagene vicleucel ORR 73%,[123] daratumumab ORR 31%,[124] Selinexor ORR 26% [125] and Blenrep ORR 31%.[126]

The applicant further asserts that ciltacabtagene autoleucel led to early and deep clinical responses in the phase1b/2 portion of the CARTITUDE–1 study at median follow up of 12.4 months. Results of CARTITUDE–1 showed a 97% overall response rate (ORR) with 67% of patients attaining a stringent complete response (sCR) and 93% of patients attaining a very good partial response (VGPR) or better after receiving a low dose (median of 0.72 million CAR T-cells per kilogram) of ciltacabtagene autoleucel within approximately a year. ORR and depth of response were independent of BCMA expression on myeloma cells at baseline. The median time to first response was one month (range, 0.9–8.5).[127]

The applicant also asserted that most patients attained a status of minimal residual disease (MRD)-negativity by the time they were evaluable for a complete response (CR). Of evaluable patients, 93.0% achieved MRD 10^{-5} negativity. Fifty-eight percent of patients were both MRD negative and in sCR at MRD detection level of 10^{-5}. Median time to MRD 10^{-5} negativity: 1 month (0.8–7.7). Among patients with 6 months individual follow-up, most had ciltacabtagene autoleucel CAR+ T-cells below the level of quantification (2 cells/μL) in peripheral blood.

In addition, progression-free survival (PFS) at 12 months was 77% (95% CI; 66.0–84.37).[128] The applicant believes this represents a substantial clinical improvement when compared to existing technologies that treat RRMM. The applicant further asserts that nearly all of the individuals participating in the study (22 of the 29 patients) were alive and continued showing no signs of disease progression after a period of 9 months. Median PFS was not reached. At median follow-up of 12.4 months, there were 14 deaths during the Phase 1b/2 study: One due to cytokine release syndrome (CRS) and hemophagocytic lymphohistiocytosis (HLH), one due to neurotoxicity, and 12 due to other causes.[98] The applicant asserts that the CRS was manageable in most patients. CRS was the most common adverse event (AE) (94.8%) observed in the CARTITUDE–1 study. The median time to onset of CRS was 7 days (range 1–12 days) post ciltacabtagene autoleucel infusion. The median duration of CRS was 4 days. Eighty-seven patients (94.6%) experienced Grade 1–2 CRS and 5 patients (5% experienced grade 3 or greater CRS)122.

The applicant noted that neurotoxicity with immune effector cell-associated neurotoxicity syndrome (ICANS) was infrequently observed in the context of CRS and was generally low grade. Neurotoxicity with ICANS was observed in 20 patients (20.6%) including 10 patients (10.3%) with Grade 3 or above toxicity.122

The LEGEND–2 study [129] is an ongoing Phase 1, single-arm, open-label, multicenter, first-in-human trial to determine the safety and efficacy of ciltacabtagene autoleucel (LCAR–B38M in China) in the treatment of patients with relapsed or refractory multiple myeloma. Enrollment in this investigator-initiated study (study proposed, initiated, and conducted by an investigator that is funded by industry) completed in November 2017; a total of 74 patients with RRMM have been treated with ciltacabtagene autoleucel CAR T-cell therapy. The clinical cutoff for the analysis of these 74 patients was February 6, 2018 with updated survival and efficacy data as of November 26, 2019 (which represents 2 years of follow-up from the date of the last subject's infusion). Seventeen patients (17/57–29%) died during the study and follow up period (19 months) mostly due to progressive disease. None were related to cytokine release syndrome or neurotoxicity, the two most common adverse events associated with CAR T-cell therapy. At data cutoff, 57 patients had received LCAR–B38M CAR T-cells.

The applicant further asserts that outcomes from the LEGEND–2 study show that cilltacabtagene autoleucel provides a significantly improved clinical outcome relative to other therapies, either approved or still under FDA review, used in the RRMM setting. At cutoff, the median follow-up was 19 months [17–22]. The overall survival (OS) rate at 18 months was 68% with a median duration of response (mDOR) of 22 months. Of MRD-negative patients with CR, 91% were still alive at data cut, with a 27 month mDOR. The median time to first response was 1.1 months. There was no relationship between best response and baseline BCMA expression level or weight-adjusted CAR T-cells infused.[105]

The applicant asserts that of patients in the LEGEND–2 study with CR, 39 of 42 were minimal residual disease negative (MRD-neg) and remained RRMM progression-free. The median PFS rate for all treated patients was 20 months; median PFS for MRD-neg patients with CR was 28 months. At 18 months, the PFS rate was 50% for all patients and 71% for MRD-neg patients with CR. Seventeen patients died during the study and the follow-up period. The causes of death included progressive disease (PD; n=11), disease relapse, PD with lung infection, suicide after PD, esophageal carcinoma, infection, pulmonary embolism and acute coronary syndrome (n=1 each). Of these, 4 did not achieve partial response (PR) or better; and 1 was not evaluable.

From the LEGEND–2 study, the median time to onset of CRS was 9 days (range, 1–19) with a median duration of 9 days (range, 3–57); all but 1 CRS events resolved. Tocilizumab (46%), oxygen (35%), vasopressor (11%), and intubation (1 patient) were used to treat CRS. Neurotoxicity with grade 1 aphasia, agitation and seizure-like activity was observed in 1 patient in the LEGEND–2 study. The applicant believes that since ciltacabtagene autoleucel displayed a manageable CRS safety profile that it represents a substantial clinical improvement over existing therapies.

After reviewing the information submitted by the applicant as part of its FY 2022 new technology add-on payment application for ciltacabtagene autoleucel, we note that there are no head-to-head comparisons of ciltacabtagene autoleucel and other CAR T-cell therapies and BCMA-targeted

therapies. We also note that the applicant chose to use ORR data as a measure of substantial clinical improvement rather than the available, and more clinically relevant, OS data.

We are inviting public comment on whether ciltacabtagene autolecuel meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for ciltacabtagene autoleucel.

e. COSELA (trilaciclib)

G1 Therapeutics submitted an application for new technology add-on payments for Trilaciclib for FY 2022. COSELA (trilaciclib) is indicated to decrease the incidence of chemotherapy-induced myelosuppression in adult patients when administered prior to a platinum/etoposide-containing regimen or topotecan-containing regimen for extensive-stage small cell lung cancer (ES–SCLC).[130]

According to the applicant, Trilaciclib is a first-in-class myelopreservation therapy that has the potential to mitigate chemotherapy-induced myelosuppression (CIM). Trilaciclib is a selective, transient inhibitor of cyclin dependent kinases 4 and 6 (CDK4/6) with potential antineoplastic and chemoprotective activities. CDK4 and CDK6 are key regulators of the G1 cell-cycle checkpoint and play important roles in cell proliferation and associated biological processes. One of the most common pathways dysregulated in cancer is the cyclin D–cyclin-dependent kinase four or six (CDK4/6)–retinoblastoma (RB) pathway. Trilaciclib arrests hematopoietic stem and progenitor (HSPCs) bone marrow cells in the G1 phase of the cell cycle during chemotherapy exposure, protecting them from chemotherapy-induced damage.

According to the applicant, the defining characteristic of cancer is uncontrolled cellular proliferation, a phenomenon that requires tumor cells to avoid or disable normal, physiologic cell-cycle regulation. While there are both CDK 4/6 independent and dependent cells, HSPCs and immune cells are CDK 4/6 dependent whereas SCLC cells are CDK 4/6 independent. According to the applicant, the transient arrest of HSPCs and lymphocytes by trilaciclib during the administration of chemotherapy is thought to have a number of beneficial effects, including a reduction in chemotherapy-induced myelosuppression and preservation of immune function, as well as an enhanced immune response.[131] [132] [133] Specifically, SCLC cells replicate independently of CDK 4/6 and therefore these cells are damaged by chemotherapy. Because HSPCs and lymphocytes are CDK 4/6 dependent, trilaciclib's mechanism of action is believed to preserve these cells by temporarily arresting their proliferation during chemotherapy. In this way, trilaciclib reduces chemotherapy-induced myelosuppression in patients with extensive-stage small-cell lung cancer (ES–SCLC).[134] The applicant also asserted that in preclinical models, CDK4/6 inhibition by trilaciclib also alters the tumor immune microenvironment through transient inhibition of the immune cells known as lymphocytes that are also dependent on CDK4/6 activity for proliferation.[135]

According to the applicant, chemotherapy remains the cornerstone of treatment for extensive stage small cell lung cancer (ES–SCLC). The applicant asserted that almost all of the ~18,600 ES–SCLC patients diagnosed each year are treated with platinum/etoposide-containing or topotecan-containing chemotherapy regimens. Chemotherapy drugs target cells at different phases of the cell cycle. According to the applicant, systemic chemotherapy, alone or in combination with immune checkpoint inhibitors, is the standard of care for patients with advanced SCLC. Additionally, per the applicant, rescue interventions, including growth factors and blood transfusions, are commonly routine therapies for SCLC. The applicant also indicated that granulocyte colony-stimulating factors (G–CSFs) only address neutropenia, while erythropoiesis stimulating agent (ESAs) and red blood cell (RBC) transfusions only address anemia, and there is no available treatment that broadly mitigates myelosuppressive effects and their corresponding impact on patient well-being before chemotherapy damage occurs.

COSELA (trilaciclib) received FDA's New Drug Application approval on February 12, 2021. COSELA is for intravenous use only. The recommended dose of COSELA is 240 mg/m2 as a 30-minute intravenous infusion completed within four hours prior to the start of chemotherapy on each day chemotherapy is administered.[136] The applicant also stated that in 2019, trilaciclib was granted Breakthrough Therapy Designation for the mitigation of clinically significant chemotherapy-induced myelosuppression in adult patients with SCLC. The applicant submitted a request for a new ICD–10–PCS code as the applicant states that there are no existing ICD–10–PCS codes that uniquely identify the administration of trilaciclib.

As previously discussed, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and, therefore, would not be considered ''new'' for purposes of new technology add-on payments.

With respect to the first criterion, whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome, the applicant asserted that trilaciclib, also referred to as G1T28, has a unique mechanism of action as a small molecule, competitive inhibitor of CDK4/6, with potential antineoplastic and chemoprotective activities. The applicant stated that upon administration, trilaciclib binds to and inhibits the activity of CDK4/6, thereby blocking the phosphorylation of

[136] G1 Therapeutics Inc., Rev. 2/2021, COSELA prescribing information: *https://www.g1therapeutics.com/cosela/pi/#:~:text=COSELA%20is%20indicated%20to%20decrease,cancer%20(ES%2DSCLC).&text=The%20recommended%20dose%20of%20COSELA%20is%20240%20mg%2Fm2%20per%20dose.*

the retinoblastoma protein (Rb) in early G1. This prevents G1/S phase transition, causing cell cycle arrest in the G1 phase and induced apoptosis, which inhibits the proliferation of CDK4/6-overexpressing tumor cells. In patients with CDK4/6-independent tumor cells, G1T28 may protect against multi-lineage chemotherapy-induced myelosuppression (CIM) by transiently and reversibly inducing G1 cell cycle arrest in hematopoietic stem and progenitor cells (HSPCs) and preventing transition to the S phase. Per the applicant, this protects all hematopoietic lineages, including red blood cells, platelets, neutrophils and lymphocytes, from the DNA-damaging effects of certain chemotherapeutics and preserves the function of the bone marrow and the immune system.

The applicant stated that the cell cycle consists of four distinct phases, Gap 1 phase (G_1), S phase, Gap 2 (G_2) post-synthesis phase, and the M phase.[137] Regulation of this process is maintained by a series of highly conserved proteins referred to as cyclins, and their catalytic binding partners, CDKs. The CDKs are a family of enzymes that control several cellular processes in mammalian cells, including the modulation of the cell cycle via binding to cyclins A–E, which results in the activation of transcription factors that regulate the cellular transition from G1 (growth phase) to S (DNA replication) and G2 (growth phase) to M (mitosis).[138]

According to the applicant, the G1-to-S checkpoint is a critical restriction point in the process of cell division. Cells are maintained in a quiescent state until the proper signal is achieved for reentry into the cell cycle. Throughout G1, expression of the D-type cyclins (D1, D2, D3) increases until active complexes with CDK4/6 are formed. Active CDK4/6 complexes partially phosphorylate RB, which allows partial depression of the transcription factor E2F. This induces additional transcript production of cyclin E1, which binds CDK2 to form active complexes that result in the hyperphosphorylation of RB and drives the cells through late G1 into S phase. Inhibition of cyclin D–CDK4/6 by the tumor suppressor CDKN2A leads to a G1 arrest and cell-cycle progression is halted.[139]

With respect to the second criterion, whether a product is assigned to the same or a different MS–DRG, the applicant asserted that trilaciclib will be assigned the same MS–DRG as existing technologies. The applicant did not explicitly state to which MS–DRG(s) trilaciclib would be assigned, but included MS–DRGs 180 (Respiratory Neoplasms with MCC), 181 (Respiratory Neoplasms with CC), and 182 (Respiratory Neoplasms without CC/MCC) in its cost analysis.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population when compared to an existing technology, the applicant stated that trilaciclib is the only proactive (preventive) multilineage (erythrocytes, leukocytes, and thrombocytes, neutrophils and lymphocytes) therapy given as a 30-minute infusion administered prior to chemotherapy on each day of chemotherapy. Due to its mechanism of action, trilaciclib's benefit is coupled to its administration schedule (that is, trilaciclib must be administered prior to chemotherapy to ensure G1 arrest of HSPCs when those cells are exposed to cytotoxic chemotherapy). According to the applicant, this therapeutic paradigm contrasts with standard available treatment options and interventions that are administered after chemotherapy to reactively reduce or treat chemotherapy side effects. The applicant asserted that typical supportive care rescue interventions such as growth factors (G–CSFs, ESAs) and red blood cell (RBC) transfusions are used after chemotherapy causes damage to stem cells. Current supportive care therapies are used reactively to treat single cell lineage specific (leukocytes and erythrocytes) complications,[140] such as neutropenia and anemia. Additionally, the applicant indicated that growth factor and RBC transfusion use are known to carry a number of risks and cause complications and adverse events.

We note that the information provided by the applicant in response to whether trilaciclib treats the same or similar type of disease or the same or similar patient population, appears to only speak to the first criterion and whether trilaciclib has a mechanism of action that is different than existing technologies; however, we believe trilaciclib appears to treat the same patient population and disease as existing therapies. We are inviting public comments on whether trilaciclib is substantially similar to an existing technology and whether it meets the newness criterion.

With respect to the cost criterion, the applicant conducted the following analysis to demonstrate that trilaciclib meets the cost criterion. In identifying the cost of trilaciclib, the applicant stated that dosing is based on body surface area, 240 mg/m^2 with an average of two vials (300mg each) per patient per dose. To identify cases that may be eligible for the use of trilaciclib, the applicant searched the FY 2019 MedPAR LDS file for claims reporting an ICD–10–PCS code of category C34 through C34.92 (Malignant neoplasm related to the bronchus, lobe, or lung) as noted in the following table.

Code	Code Descriptor
C34	Malignant neoplasm of bronchus and lung
C34.0	Malignant neoplasm of main bronchus
C34.00	Malignant neoplasm of unspecified main bronchus
C34.01	Malignant neoplasm of right main bronchus
C34.02	Malignant neoplasm of left main bronchus
C34.1	Malignant neoplasm of upper lobe, bronchus or lung

Code	Code Descriptor
C34.10	Malignant neoplasm of upper lobe, unspecified bronchus or lung
C34.11	Malignant neoplasm of upper lobe, right bronchus or lung
C34.12	Malignant neoplasm of upper lobe, left bronchus or lung
C34.2	Malignant neoplasm of middle lobe, bronchus or lung
C34.3	Malignant neoplasm of lower lobe, bronchus or lung
C34.30	Malignant neoplasm of lower lobe, unspecified bronchus or lung
C34.31	Malignant neoplasm of lower lobe, right bronchus or lung
C34.32	Malignant neoplasm of lower lobe, left bronchus or lung
C34.8	Malignant neoplasm of overlapping sites of bronchus and lung
C34.80	Malignant neoplasm of overlapping sites of unspecified bronchus and lung
C34.81	Malignant neoplasm of overlapping sites of right bronchus and lung
C34.82	Malignant neoplasm of overlapping sites of left bronchus and lung
C34.9	Malignant neoplasm of unspecified part of bronchus or lung
C34.90	Malignant neoplasm of unspecified part of unspecified bronchus or lung
C34.91	Malignant neoplasm of unspecified part of right bronchus or lung
C34.92	Malignant neoplasm of unspecified part of left bronchus or lung

According to the applicant, based on the advice of clinical experts, it limited case selection criteria to claims that included one of MS–DRGs 180, 181, or 182. The applicant then randomly selected 15% of the claims from the sample to account for the fact that SCLC comprises 15% of lung cancer cases.[141] Based on the FY 2019 MedPAR LDS file, the applicant identified 3,500 cases. The applicant noted that 2,346 cases mapped to MS–DRG 180; 1,085 cases

[141] Govindan R, et al. *J Clin Oncol.* 2006;24:4539–44. Byers LA, Rudin CM. *Cancer.* 2015;121:664–72.

mapped to MS–DRG 181; and 69 cases mapped to MS–DRG 182.

Using these 3,500 cases, the applicant then calculated the unstandardized average charges per case for each MS–DRG. Because the use of trilaciclib results in approximately half of patients no longer needing drugs used to counter the effects of chemotherapy during the inpatient stay, the applicant removed 50% of the drug charges for the technology being replaced.

The applicant then standardized the charges using the 2019 IPPS/LTCH PPS final rule impact file and inflated the charges by 1.13218 or 13.2 percent, the same inflation factor used by CMS to update the outlier threshold in the FY 2021 IPPS/LTCH PPS final rule. The applicant then added the charges for trilaciclib by converting the costs to a charge by dividing the cost by the national average cost-to-charge ratio of 0.187 for pharmacy from the FY 2021 IPPS/LTCH PPS final rule.

Using the data file thresholds associated with the FY 2021 IPPS/LTCH PPS final rule correction notice, the average case-weighted threshold amount was $57,031. In the applicant's analysis, the final inflated average case-weighted standardized charge per case was $95,701. Because the final inflated average case-weighted standardized charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion.

With respect to the cost criterion, we note that in listing the codes it used to identify cases that may be eligible for the use of trilaciclib, the applicant provided several ICD–10 codes that lack four digits and thus, are considered invalid. We would be interested in understanding the basis for the applicant's choice of codes. We also note that in its analysis, the applicant randomly selected 15% of the claims from the sample to account for the fact that SCLC comprises 15% of lung cancer cases. In so doing, the applicant is making the assumption that SCLC cases are randomly distributed amongst all cases from which the applicant sampled. By randomly sampling the population, the applicant is selecting a subsample that is ideally similar to the population with less variance. It may be the case that SCLC cases are systematically different from other cases in the population. If this is true, then a random sample may not be appropriate. Accordingly, we question the appropriateness of the sampling used and whether it accurately represents cases that would use the technology.

Finally, with respect to pricing, it appears that the applicant's final inflated average case-weighted standardized charge per case reflects pricing prior to the availability of more current total wholesale acquisition cost. We therefore request that the applicant update its cost analysis to reflect the final inflated average case weighted standardized charge per case based on this more current information. We are inviting public comment on whether trilaciclib meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that trilaciclib represents a substantial clinical improvement over existing technologies because it offers a treatment option for patients unresponsive to or ineligible for currently available treatments and improves clinical outcomes for a patient population as compared to currently available treatments. The applicant stated that chemotherapy-induced myelosuppression (CIM) is typically managed with treatment dose delays and reductions due to the slow recovery of bone marrow after a course of chemotherapy.[142] The applicant also stated that CIM is managed with rescue interventions including hematopoietic growth factors (G–CSFs and ESAs) and by RBC and platelet transfusions.[143] [144] Per the applicant, despite the availability and use of these treatment options, CIM continues to be of clinical significance and remains a central concern in the delivery of chemotherapy.[145] [146] The applicant further stated that myelosuppression results in dose reductions, dose delays, and/or dose discontinuations, affecting the dose intensity and intended antitumor efficacy of chemotherapy.[147] Per the applicant, the supportive care interventions for treatment of myelosuppression are suboptimal and are often administered reactively, do not protect the bone marrow from chemotherapy-induced cytotoxic effects, are specific to single hematopoietic lineages, and impart their own risks for adverse reactions.[148] The applicant concluded by stating that new approaches that proactively prevent chemotherapy-induced damage and its associated consequences, whilst not decreasing the efficacy of chemotherapy, are urgently needed to improve care of patients with ES–SCLC.[149]

In regard to the claim that the use of trilaciclib significantly improves clinical outcomes for a patient population as compared to currently available treatments, the applicant stated that the administration of trilaciclib prior to chemotherapy in patients with SCLC prevented chemotherapy-induced neutropenia, reduced chemotherapy-induced anemia, reduced CIM or sepsis-related hospitalizations, and has the potential to improve the management and quality of life of patients receiving myelosuppressive chemotherapy as compared to placebo.[150]

The applicant presented eight claims in support of the assertion that trilaciclib represents substantial clinical improvement over existing technologies in the mitigation of clinically significant chemotherapy-induced myelosupression in adult patients with SCLC.

In its first and second claims, the applicant asserted that trilaciclib reduces the mean duration of severe G4 neutropenia in cycle 1 of chemotherapy and reduces the proportion of patients experiencing severe G4 neutropenia in comparison to placebo. The applicant submitted three sources in support of these claims. First, the applicant submitted a poster presentation from Daniel, et. al., describing a global, randomized, double-blind, placebo-controlled, multicenter, phase 2 study that assessed the potential of trilaciclib to reduce the incidence and consequences of chemotherapy-induced myelosuppression in patients with newly diagnosed ES–SCLC treated with etoposide, carboplatin, and atezolizumab. One hundred seven eligible patients were randomized to

[150] Ferrarotto R, Anderson I, Medgyasszay B, et al. Trilaciclib reduces the need for growth factors and red blood cell transfusions to manage chemotherapy-induced myelosuppression. Poster presented at: IASLC: 2020 North America Conference on Lung Cancer; October 16–17, 2020; Virtual congress.

receive trilaciclib (n = 53) or placebo (n = 54). The primary endpoints were mean duration of severe neutropenia (SN) in cycle 1 and percent of patients with grade 4 SN. Results summarized mean duration of SN in cycle 1 as 0 days with trilaciclib and 4 days with placebo, and percent of patients with grade 4 SN as 1.9% vs 49.1%, respectively.[151]

Second, the applicant submitted an article by Weiss, et. al., summarizing a phase II randomized, double-blind placebo-controlled study of the safety, efficacy and pharmacokinetics (PK) of trilaciclib in combination with etoposide/carboplatin (E/P) therapy for treatment-naive extensive-stage small-cell lung cancer patients. Thirty-nine patients were included in the trilaciclib group versus 38 in the placebo group. The applicant stated that treatment with trilaciclib resulted in a reduced mean duration of severe G4 neutropenia in cycle 1 (0 days versus 3 days in placebo) and reduced proportion of patients experiencing severe G4 neutropenia for trilaciclib (5% versus 43%).[152]

Third, the applicant submitted a presentation from Hart, et. al., describing a randomized, double-blind, placebo-controlled, phase 2 study to compare the results of 32 patients receiving Trilaciclib versus 28 receiving placebo in patients being treated with topotecan for previously treated ES–SCLC. Primary endpoints were mean duration of SN in cycle 1 and the percentage of patients with SN. Results demonstrated that the mean duration of severe G4 neutropenia in cycle 1 was reported at 2 days for trilaciclib versus eight days for placebo. The proportion of patients experiencing severe G4 neutropenia was reported at 41% for trilaciclib versus 76% for placebo.[153]

In the third claim, the applicant asserted that trilaciclib reduces the proportion of patients experiencing febrile neutropenia treatment emergent adverse events (TEAE) in comparison to placebo. In the fourth claim, the applicant asserted that trilaciclib decreases the rate of therapeutic intervention with G–CSF in comparison to placebo, noting that growth factors are known to carry a number of risks, cause complications and adverse events. In the fifth claim, the applicant asserted that trilaciclib reduces the proportion of patients experiencing grade 3/4 anemia in comparison to placebo. In the sixth claim, the applicant asserted that trilaciclib decreases the rate of therapeutic intervention with red blood cell transfusions in comparison to placebo. To support these claims, the applicant submitted a 2020 poster presentation from Weiss, et. al., describing a pooled analysis across three RCTs that compared the proportion of ES–SCLC patients experiencing febrile neutropenia between trilaciclib and placebo. The trilaciclib group included 122 patients and the placebo group included 118 patients. The presentation reflected the following results: The proportion of patients experiencing febrile neutropenia for trilaciclib was 3% versus placebo at 9%; the rate of therapeutic intervention with G–CSF for trilaciclib at 29% versus 56% for placebo; the proportion of patients experiencing grade 3/4 anemia for trilaciclib at 20% versus 32% for placebo; and the rate of therapeutic intervention with red blood cell transfusions for trilaciclib at 15% versus 26% for placebo.[154]

In the seventh claim, the applicant asserted that trilaciclib delays time to deterioration in symptoms and functioning domains of patient-reported quality of life measures on Functional Assessment of Cancer Therapy (FACT) scores. The applicant submitted a 2019 presentation from Weiss, et. al., describing a pooled analysis across three RCTs. The applicant stated that trilaciclib delays time to confirmed deterioration in a variety of symptoms and functioning domains compared to placebo, for example: median of 4.7 months delay to deterioration for fatigue; median of 3.5 months delay for anemia; and median of 4 months delay for functional well-being.[155]

In the eighth claim, the applicant asserted that trilaciclib decreases the number of hospitalizations due to myelosuppression or sepsis. The applicant submitted a conference agenda referring to an oral presentation by Ferrarotto, et. al., at the North America Conference on Lung Cancer, October 16, 2020. The applicant stated that hospitalizations due to myelosuppression or sepsis occurred in significantly fewer patients and significantly less often among patients receiving trilaciclib prior to chemotherapy versus placebo though we were unable to locate support for this claim in the conference agenda submitted with the application.[156]

With respect to the substantial clinical improvement criterion, we note that the data submitted by the applicant included one published peer reviewed article from Weiss, et. al.,[157] abstracts from Daniel, et. al.,[158] and Hart, et. al.,[159] and references to trials exploring broader cohorts of small cell lung cancer, breast cancer and colon cancer patients. In addition, as summarized previously, we note that most of the studies submitted by the applicant had sample sizes fewer than 100 participants which may limit generalizability of the studies. With respect to the Weiss, et. al., study, we note that trilaciclib was compared with placebo at a significance level of two-sided $\alpha = 0.2$ which is much lower than the typical cutoff of 0.05 and may have increased the risk of false positives and interfered with the ability to draw conclusions that are based on statistical methods. We also note the lack of any statistical correction for multiple comparisons. We note that

in sources provided by the applicant, mean duration of severe neutropenia was assessed in day increments.[160] [161] [162] [163] However, it is not clear that zero days would indicate that those patients experienced no severe neutropenia. Specifically, we question whether mean hours in severe neutropenia was evaluated or whether, in addition to the groupings by days, one day or less would be an appropriate value for inclusion. Finally, while the applicant referred to decreases in the number of hospitalizations, we note that the source provided was limited to a conference agenda that only linked to an abstract pertaining to reductions in utilization of supportive care interventions but did not reflect hospitalization rates.[164]

We invite public comments as to whether trilaciclib meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for trilaciclib.

f. Ellipsys® Vascular Access System

Avenu Medical, Inc. submitted an application for new technology add-on payments for the Ellipsys® Vascular Access System (''Ellipsys'') for FY 2022. Ellipsys is a device that enables percutaneous creation of an arteriovenous fistula (AVF), which is used to access the bloodstream for hemodialysis for the treatment of end-stage renal disease (ESRD). According to the applicant, to create the fistula, a physician inserts a crossing needle through the perforating vein and into the proximal radial artery in the forearm. A specialized catheter is then used to bring the artery and vein together. The two vessels are ''welded'' together with thermal resistance energy, creating an anastomosis. According to the applicant, the only means of creating an AVF was through open surgery before the approval of Ellipsys, and percutaneous AVF (pAVF) offers a number of advantages over surgical AVF (sAVF).

With respect to the newness criterion, the applicant for Ellipsys received 510(k) clearance from the FDA on August 9, 2019, with an indication for the creation of a proximal radial artery to perforating vein anastomosis via a retrograde venous access approach in patients with a minimum vessel diameter of 2.0mm and less than 1.5mm of separation between the artery and vein at the fistula creation site who have chronic kidney disease requiring dialysis.[165] The subject of this 510(k) clearance was an update to the Instructions for Use (IFU) to allow an additional procedural step for balloon dilation of the anastomosis junction at the radial artery and adjacent outflow vein of the AVF immediately after creation with the Ellipsys catheter. Per the applicant, the device was immediately available on the market. The applicant further stated that the device was originally approved under a De Novo clearance on June 22, 2018. Ellipsys also received two additional 510(k) clearances dated January 25, 2019 (minor change in the packaging of components) and October 5, 2018 (minor technological differences in the power control unit and minor enhancements to the catheter design) but the applicant states they are not regarded as material for this application. The FDA has classified Ellipsys as a Class II device under the generic name percutaneous catheter for creation of an arteriovenous fistula for hemodialysis access. The applicant stated that currently, two ICD–10–PCS codes identify procedures using Ellipsys: 031B3ZF (Bypass right radial artery to lower arm vein, percutaneous approach); and 031C3ZF (Bypass left radial artery to lower arm vein, percutaneous approach). However, since these codes also identify the WavelinQ™ EndoAVF System (''WavelinQ''), another percutaneous fistula device, Avenu Medical submitted a code request for a unique ICD–10–PCS code to distinctly identify Ellipsys beginning in FY 2022. The applicant stated this technology was first assigned HCPCS code C9754 on January 1, 2019, which was then replaced by HCPCS code G2170 on July 1, 2020. Per the applicant, WavelinQ was assigned HCPCS codes (C9755 replaced by G2171) with the same timing, and the codes for the 2 pAVF technologies are differentiated by the use of thermal resistance energy for Ellipsys and the use of radiofrequency energy for WavelinQ.

The applicant stated that hemodialysis access for the treatment of ESRD can be provided by catheter, graft, or AVF, of which AVF is generally preferred for patients whose vascular anatomy and condition permit it. Per the applicant, the only method for creating an AVF was through an open surgical approach until the introduction of Ellipsys and WavelinQ, two devices that use a percutaneous approach.

As discussed earlier, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, the applicant asserted that Ellipsys uses a new mechanism of action compared to its initial clearance. Per the applicant, the current device included an additional step in the IFU, creating a different procedure profile and a different mechanism of action. The applicant states that the addition of this step, a balloon angioplasty performed within the same operative session as the creation of the pAVF, instead of days or weeks later, typically contributes to decreased time to maturation, improved initial flow, and helps avoid early thrombosis of the newly-created access, in addition to decreasing the number of secondary procedures required for maturation and maintenance. According to the applicant, the explicit inclusion of the step in the IFU, where it was not previously explicitly included, represents a new mechanism of action.

With respect to the second criterion, whether a product is assigned to the same or different MS–DRG, the applicant generally stated that Ellipsys is assigned to the same MS–DRGs as existing technologies. According to information provided by the applicant,

[160] Weiss JM, Csoszi T, Maglakelidze M, et al. Myelopreservation with the CDK4/6 inhibitor trilaciclib in patients with small-cell lung cancer receiving first-line chemotherapy: A phase Ib/randomized phase II trial. Ann Oncol. 2019;30(10):1613–1621.

[161] Daniel D, Kuchava V, Bondarenko I, et al. Trilaciclib (T) decreases myelosuppression in extensive-stage small cell lung cancer (ES–SCLC) patients receiving first-line chemotherapy plus atezolizumab. [163] Weiss J, Goldschmidt J, Andric Z et al. Myelopreservation and Reduced Use of Supportive Care with Trilaciclib in Patients with Small Cell Lung Cancer [Poster Presentation]. Presented at: American Society of Clinical Oncology (ASCO). May 2020.

[164] Ferrarotto R, Anderson I, Medgyasszay B, et al. Trilaciclib reduces the need for growth factors and red blood cell transfusions to manage chemotherapy-induced myelosuppression. [Oral Presentation]. Presented at: North America Conference on Lung Cancer, October 2020. *https://naclc2020.iaslc.org/program-at-a-glance/.*

[165] U.S. Food and Drug Administration (FDA). Center for Devices and Radiological Health. 510(k) Summary No. K1191114. 2019. Retrieved from: *https://www.accessdata.fda.gov/cdrh_docs/pdf19/K191114.pdf.*

these MS–DRGs appear to be MS–DRGs 264, 356, 357, 358, 628, 629, 630, 673, 674, 675, 907, 908, 909, 981, 982, and 983. With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant generally stated that Ellipsys will be used to treat the same or similar type of disease and the same or similar patient population as the current standard-of-care treatments.

In summary, the applicant believes that Ellipsys is not substantially similar to other currently available therapies and/or technologies because it uses a new mechanism of action and that therefore, the technology meets the ''newness'' criterion. However, we believe that the mechanism of action for Ellipsys may be the same or similar to the original version of the Ellipsys system, which received FDA approval on June 22, 2018. Though the current IFU includes an additional procedure as part of the index procedure, it is not clear that this step of balloon angioplasty done concurrently changes the mechanism of action of the Ellipsys system. Per the FDA's 510(k) summary, compared to the predicate device, there were no changes to the device or the manner in which it creates a percutaneous anastomosis, and other than the additional procedural step of balloon dilation, all characteristics remain unchanged.[166] In addition, clinicians were not precluded from performing this step before the change in the IFU, and in fact, balloon dilation was already performed during the index procedure in some cases.[167] Though the applicant maintains that performing this additional step in all cases, as opposed to some, leads to superior clinical outcomes, we are unclear if this has any bearing on newness for this technology or if it represents a change in the mechanism of action of this device. We note that if the current device is substantially similar to the original version of Ellipsys, we believe the newness period for this technology would begin on June 22, 2018 with the De Novo approval date and, therefore, because the 3-year anniversary date of the technology's entry onto the U.S. market (June 22, 2021) would occur in FY 2021, the technology would no longer be considered new and would not be eligible for new technology add-on payments for FY 2022. We welcome public comments on whether the change in the Ellipsys IFU represents a change to the device's mechanism of action.

We also note that differences in mechanism of action between Ellipsys and WavelinQ were not included. We note that CMS stated in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58702) that WavelinQ uses a unique mechanism of action that differed from that of other commercially available devices.

We are inviting public comments on whether Ellipsys is substantially similar to other currently available therapies and/or technologies and whether this technology meets the newness criterion.

With regard to the cost criterion, the applicant conducted the following analysis to demonstrate that the technology meets the cost criterion.

The applicant searched the FY 2019 MedPAR claims data file with the FY 2019 IPPS/LTCH PPS final rule correction notice IPPS Impact File to identify potential cases representing patients who may be eligible for treatment using the Ellipsys. The applicant stated that currently, there are two ICD–10–PCS procedure codes that describe percutaneous AVF in the radial artery: 031B3ZF (Bypass right radial artery to lower arm vein, percutaneous approach) and 031C3ZF (Bypass left radial artery to lower arm vein, percutaneous approach). The applicant stated that these codes are not specific to percutaneous AVF formation using thermal energy. We note that the applicant submitted a request for approval for a unique ICD–10–PCS code for the use of the Ellipsys beginning FY 2022. The applicant stated that if the procedure were reported with the previously mentioned procedure codes, Ellipsys would be mapped to the following MS–DRGs:

MS-DRG	Title
264	Other Circulatory System O.R. Procedures
356	Other Digestive System O.R. Procedures with MCC
357	Other Digestive System O.R. Procedures with CC
358	Other Digestive System O.R. Procedures without CC/MCC
628	Other Endocrine, Nutritional and Metabolic O.R. Procedures with MCC
629	Other Endocrine, Nutritional and Metabolic O.R. Procedures with CC
630	Other Endocrine, Nutritional and Metabolic O.R. Procedures without CC/MCC
673	Other Kidney and Urinary Tract Procedures with MCC
674	Other Kidney and Urinary Tract Procedures with CC
675	Other Kidney and Urinary Tract Procedures without CC/MCC
907	Other O.R. Procedures For Injuries with MCC
908	Other O.R. Procedures For Injuries with CC
909	Other O.R. Procedures For Injuries without CC/MCC
981	Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC
982	Extensive O.R. Procedures Unrelated to Principal Diagnosis with CC
983	Extensive O.R. Procedures Unrelated to Principal Diagnosis with CC/MCC

The applicant added that ICD–10 codes 031B3ZF and 031C3ZF were new effective October 1, 2019 and therefore do not appear in the 2019 claims data. According to the applicant, the most common MS–DRGs for patients admitted with chronic kidney disease and who received an open procedure for creation of an AVF are shown below.

[166] U.S. Food and Drug Administration (FDA). Center for Devices and Radiological Health. 510(k) Summary No. K1191114. 2019. Retrieved from: *https://www.accessdata.fda.gov/cdrh_docs/pdf19/K191114.pdf.*

MS-DRG	Title
264	Other Circulatory System O.R. Procedures
673	Other Kidney and Urinary Tract Procedures w MCC
674	Other Kidney and Urinary Tract Procedures w CC
252	Other Vascular Procedures w MCC
628	Other Endocrine, Nutritional and Metabolic O.R. Procedures w MCC

The applicant has not made a request for Ellipsys to be mapped to a new MS–DRG for FY 2022.

The applicant stated that claims which had a diagnosis code for Chronic Kidney Disease (CKD) stage IV, CKD stage V, or ESRD and which included an open bypass of the subclavian artery to upper arm vein or the radial artery to lower arm vein during the same stage were included in the cost analysis. The applicant stated they used the following ICD–10 codes in their analysis to identify claims.

Codes	Description
ICD-10-CM Diagnosis Codes	
N18.4	Chronic kidney disease, stage 4
N18.5	Chronic kidney disease, stage 5
N18.6	End stage renal disease
ICD-10-PCS Procedure Codes	
03130ZD	Bypass right subclavian artery to upper arm vein, open approach
03140ZD	Bypass left subclavian artery to upper arm vein, open approach
031B0ZF	Bypass right radial artery to lower arm vein, open
031B3ZF	Bypass right radial artery to lower arm vein, perc
031C0ZF	Bypass left radial artery to lower arm vein, open
031C3ZF	Bypass left radial artery to lower arm vein, perc

Cases mapping to the top five MS–DRGs by volume were selected, which resulted in 689 cases or 79% of case volume.

The applicant determined an average unstandardized case weighted charge per case of $91,190.

The applicant did not remove charges for prior technology because the cases identified included an open procedure that is not performed using a specific device. However, the applicant stated that all charges for the operating room (OR) were removed as the procedures involving the technology would not always be performed in an OR. The applicant stated that departmental charges were standardized using the factors from the standardization file released with the FY 2021 final rule. The applicant then standardized the charges using the FY 2019 Final Rule with Correction Notice Impact File. Next, the applicant applied the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges (1.13218). To calculate the charges for the technology, the applicant used the national average CCR for the Supplies and Equipment cost center of 0.297 from the FY 2021 IPPS/LTCH PPS final rule. The applicant added charges for other items and services related to the technology; half of the average departmental charges for the OR removed in a prior step were added back to the per case charge, by MS–DRG, as procedures using the technology would sometimes be performed in an OR. The applicant calculated a final inflated average case-weighted standardized charge per case of $119,158, which exceeded the average case-weighted threshold amount of $91,190 by $27,967. The applicant stated that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the therapy meets the cost criterion.

We note that the applicant used claims with open subclavian artery bypass to upper arm vein, in addition to radial lower arm fistulas, as a proxy for Ellipsys cases. The applicant stated that Ellipsys may provide an alternative to these cases in some instances where AVF placement in the radial arteries is possible but the surgeons are unfamiliar with the procedure. However, we question if these are the most appropriate proxy, as Ellipsys should not replace radiocephalic fistulas, per standard guidelines that recommend wrist fistulas first; and it would be more likely that surgeons would use Ellipsys over upper arm fistulas than a subclavian fistula, which is used rarely in standard practice.

We are inviting public comments on whether the Ellipsys® Vascular Access System meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that the Ellipsys® Vascular Access System represents a substantial clinical improvement over existing technologies. Broadly, the applicant outlined three comparators with respect to which it asserted Ellipsys provides a substantial clinical improvement: (1) Percutaneous AVF with the WavelinQ™ (4F) EndoAVF System; (2) percutaneous AVF (pAVF) with the prior version of Ellipsys; and (3) surgical AVF (sAVF).

With respect to the first comparison, Ellipsys as compared to WavelinQ, the applicant stated that Ellipsys has improved outcomes including technical success and cumulative patency. The applicant cited the following to support superiority of Ellipsys over WavelinQ: (1) Higher fraction of cases with clinically functional AVFs; (2) speedier maturation; (3) more durable AVFs; and (4) smaller failure rate. According to the applicant, no head-to-head clinical trial is available, but they provided one retrospective study that provides a direct comparison between the two pAVF systems to support their claims.

Shahverdyan et al. performed a retrospective review of 100 patients undergoing percutaneous fistula creation at a single site in Germany between December 2017 and December 2019 to compare outcomes with pAVF

creation using the Ellipsys and WavelinQ systems.[168] In this single-operator, comparative case series, 65 Ellipsys procedures and 35 WavelinQ procedures were completed, following a procedure sequence algorithm for selecting the type of vascular access. Per the study, wrist sAVF was the first choice as per standard practice guidelines, followed by proximal forearm pAVF, resulting in 100 pAVFs using Ellipsys (n=65) and WavelinQ (n=35). Demographics for the study patients included 69 percent male and median age of 64.1 years. There were no significant differences between WavelinQ and Ellipsys patients in age, Body Mass Index (BMI), Chronic Kidney Disease (CKD) status, AVF history, or presence of diabetes, though the WavelinQ group had a higher proportion of males. The primary endpoints were technical success, time to maturation, functional patency, and time to first clinical use, and median follow-up was 186.5 days. The study reported technical success, defined as post-procedure ultrasound examination demonstrating a patent anastomosis and fistula flow, with Ellipsys at 100 percent vs. 97 percent with WavelinQ (p=0.35). Interventions were performed in approximately 27 percent of cases for both technologies, and the number of interventions per patient-year was 0.96 vs. 0.46, respectively.

Per the applicant, the study demonstrated a higher fraction of cases with clinically functional AVFs using Ellipsys, as fistula maturation at four weeks was 68.3 percent with Ellipsys vs. 54.3 percent with WavelinQ (p=0.1709), and at the end of the study period, 83.3% and 71.4% respectively. In addition, the applicant stated that successful dialysis access was achieved in 79.5 percent of Ellipsys cases vs. 60.9 percent for WavelinQ cases among patients on dialysis (p=0.0711). The applicant also stated that the study demonstrated that Ellipsys results in speedier maturation with Ellipsys demonstrating a median time to cannulation of 60 days vs. 90 days with WavelinQ (p=0.3676). Next, the applicant stated that use of Ellipsys demonstrated more durable AVFs, with a secondary patency rate (the time from fistula creation to fistula abandonment, including any interventions) at 12 months of 82 percent as compared to 60 percent with WavelinQ, and a functional patency rate of 100% vs 85.7%, respectively. We note that primary patency (the time from fistula creation to the first intervention) between groups was not significantly different. Lastly, access failure occurred in 15.4 percent of Ellipsys patients vs 37.1 percent of WavelinQ patients (p=0.0137), which demonstrated that use of Ellipsys results in a smaller failure rate, according to the applicant.

With regard to the second comparison, Ellipsys compared to the previous version of the technology, the applicant states that since the IFU dated 8/9/19 now states that balloon angioplasty should be performed at the time of the creation procedure, they believe that Ellipsys should be considered a different device. Per the applicant, this subtle difference is of key clinical importance to successful use of Ellipsys, as this method decreases the time to two-needle cannulation (2NC) and also improves initial flow, resolving vascular spasm at the time of the procedure and reducing early thrombosis. The applicant further states that performing balloon angioplasty 100 percent of the time also decreases the number of secondary procedures. To support these claims, the applicant compared results from the Ellipsys pivotal trial that used the earlier IFU, in which angioplasty was performed simultaneously on 19% of patients, with the Ellipsys post-market registry that implemented the change and performed the additional step on 100% of patients.

Ellipsys's pivotal trial was a prospective, single-arm, non-inferiority study of 107 patients at five sites to compare Ellipsys with a 90-day performance goal based on a meta-analysis of surgical results from the literature.[169] Inclusion criteria included vascular anatomy specific to the indications for Ellipsys, age between 18 and 80 years old, and CKD stage IV or V. Exclusion criteria included recent surgery or major illness within 6 weeks, acute or active infection, and use of immunosuppressive medication. Of 261 patients evaluated, a total of 117 met inclusion and exclusion criteria, with 28 percent excluded due to unsuitable anatomy. 107 were included in the intent to treat (ITT) population after each study site completed 2 proctored procedures. Demographics included 73 percent male, mean patient age of 56.7 years, and mean BMI of 31.2 percent. All patients in the ITT population received a pAVF with Ellipsys between the proximal radial artery and perforating vein, followed by separate maturation procedures. The primary efficacy endpoint of the study was maturation success, defined as brachial artery flow volume greater than or equal to 500ml/min and target vein diameter greater than or equal to 4mm in more than 49 percent of patients at 90 days. This performance goal was obtained from a meta-analysis of 8 studies of open sAVF, where the weighted least squares mean success rate was 62 percent, and the lower bound from a 2-sided 95 percent lower confidence interval was 49 percent. The primary safety endpoint was the absence of device-related complications at 90 days. Access failure occurred in 4/107, with a technical success rate of 95 percent. The primary endpoint was met by 86 percent at 90 days (the 97.5 percent lower confidence interval was 77.9 percent), exceeding the 49 percent performance goal (p<0.0001). Cumulative patency was 91.6 percent at 90 days and 86.7 percent at 1 year. During the 12-month study, 88 percent of the patients on hemodialysis (71 of 81) had successful 2-needle cannulation, including 63 patients on dialysis at enrollment and 18 who initiated dialysis during the study. The mean time to cannulation was 114.3 days ± 66.2 (34–345 days). Per the authors, spasm of the perforating vein was easily treated with vasodilators and balloon dilation as a matter of routine care. Nineteen percent of patients (20/107) received balloon dilation during the index procedure, and second stage maturation procedures included 113 balloon dilations in 77 patients. A total of 205 maturation procedures were performed on 99 patients at a mean of 35.1 days. An additional 66 maintenance procedures were performed in 35 patients at a mean of 17 days, for a total of 271 secondary procedures during the 12 months of the study (2.7 per patient year).

The Ellipsys post-market registry by Hull et al. was a prospective single-operator study of 60 patients receiving a pAVF with Ellipsys at a single outpatient US site in an attempt to understand patient selection, maturation, and cannulation with pAVFs.[170] Patient demographics included 57 percent male, mean age of 64, and mean BMI of 30.7. 123 patients with ESRD stages IV and V were evaluated by ultrasound to determine suitability for AVF. Ninety-two percent were eligible for sAVF and 61 percent

[168] Shahverdyan et al., ''Comparison of Outcomes of Percutaneous Arteriovenous Fistulae Creation by Ellipsys and WavelinQ Devices,'' *Journal of Vascular and Interventional Radiology* 2020; 31(9): 1365–1372. (Published on-line August 11, 2020.)

[169] Hull JE, Jennings W, et al., ''The Pivotal Multicenter Trial of Ultrasound-Guided Percutaneous Arteriovenous Fistula Creation for Hemodialysis Access,'' *Journal of Vascular and Interventional Radiology* 2018; 29: 149–158.et al.,

[170] Hull JE, Deitrick J, Groome K, ''Maturation for Hemodialysis in the Ellipsys® EndoAVF Post-Market Registry,'' *Journal of Vascular and Interventional Radiology* 2020; 31(9): 1373–1381. (Published on-line August 13, 2020.)

were eligible for pAVF. Of the 95 patients who received an AVF, 63 percent (60) received pAVF and 37 percent (35) received sAVF. All 60 pAVF patients underwent pAVF creation under ultrasound guidance, followed by balloon dilation, as compared to the pivotal trial where only 19 percent had balloon dilation as part of the index procedure. After 4 weeks, maturation and suitability for dialysis were assessed. The fistulas were considered suitable when palpable on examination and the target vein had 500ml/min flow volume and 5mm diameter. Fifty-two additional maturation procedures, including balloon dilation in 62 percent, were performed in 40 of 60 patients to achieve adequate flow volume and diameter in the target vein. Physiologic maturation was achieved in 93 percent (56 of 60 patients) with a mean time of 40.4 days ± 4.3, and of the remaining 4 patients, one thrombosed and three died prior to maturation. In the 54 patients requiring dialysis, 87 percent achieved 2NC at a mean of 76.8 days. Six month cumulative patency and functional patency were both 94 percent. 70 maintenance procedures were performed in 63 percent. Only 2 patients achieved 2NC without an additional procedure. The authors noted that this study is limited by a modest sample size and single-site study with surgeons experienced in pAVF creation, and that results were not compared to surgery.

According to the applicant, the post-market registry demonstrated the significant clinical differences between performing balloon angioplasty as part of the index procedure 19 percent of the time (as seen in the pivotal trial) compared to 100 percent of the time. The results showed that the average time to 2NC decreased from 100 days to 70 days. The study also compared initial AVF flow between the studies, which increased to 649 ml/min from 330.4 ml/min, attributed to the reduction in instances of venospasm due to balloon dilation.[171] According to the study investigators, this decrease in venospasm and higher flow led to a reduction in early thrombosis from 11 percent to 2 percent. Lastly, the applicant compared the number of secondary procedures between the two studies with the following table:

	Maturation Procedures per Patient	Maintenance Procedures per Patient	Total Secondary Procedures per Patient
Pivotal Trial	205/103 = 1.99	66/103 = 0.64	2.63
Maturation Study	52/60 = 0.87	70/60 = 1.17	2.04

Per the applicant, despite the higher standard for maturation in the second study (5mm target vein diameter vs 4mm in the pivotal study), the number of maturation procedures decreased, while maintenance procedures increased. Overall, secondary procedures decreased with the new protocol, as described in the table submitted by the applicant.

With respect to the third comparison, Ellipsys as compared to sAVF, the applicant stated that Ellipsys creates a side-to-side fistula with a percutaneous approach while sAVFs for the most part create end-to-side fistulas. According to the applicant, in patients that have suitable anatomy for pAVF creation, this method of fistula creation contributes to improved outcomes in five ways: (1) Higher fraction of cases with clinically functional AVFs; (2) decreased time to two-needle cannulation; (3) more durable AVFs; (4) decreased need for secondary interventions; and (5) patient satisfaction with Ellipsys AVFs. According to the applicant, no head-to-head studies or randomized trials between Ellipsys and sAVFs are available, and instead, results of key variables of interest were compared using studies with comparable results for sAVFs from published literature. The applicant provided 2 prospective single-arm studies and 5 retrospective studies, including the studies previously discussed, to support these claims. They also submitted data from one unpublished study. Aside from the Ellipsys pivotal trial, the Ellipsys post-market registry, and the comparison study with WavelinQ already summarized, the remaining studies are summarized below.

The 2-year results of the pivotal trial were analyzed retrospectively by Beathard.[172] 105 patients with 2 year follow-up data were included, and of these, 103 had functioning fistulas and all were receiving dialysis except 3. Cumulative patency at 18 and 24 months was 92.8 percent and 91.6 percent, respectively. Patient experience with pAVF was assessed among those who had received a previous access procedure (⅓). When compared to their previous procedure, patients rated Ellipsys as the same in 68 percent, better or much better in 29 percent, and worse in 3 percent. Patients mentioned difficulty with cannulation due to unfamiliarity of dialysis staff with pAVF, but commented on the lack of surgical scar and short recovery time. Among all patients who responded, 93 percent rated their access as very good or excellent.

A retrospective review of 34 patients who received pAVF between May 2017 and November 2018 at a clinic in France was submitted.[173] Patients included had ESRD, were not candidates for wrist fistulas, and met the anatomic criteria for use of Ellipsys. Demographics included patients that were 58 percent male, 65 percent Caucasian and 35 percent African, and a mean age of 62 years old. After fistula creation with Ellipsys, all anastomoses received balloon dilation. Twenty-four of 34 patients had successful 2NC within 6 weeks. Forty-four percent of patients did not require secondary interventions, and 12 percent required additional dilation within 4 weeks to improve maturation. Two patients converted to a surgical fistula due to cannulation difficulties. No patients developed steal syndrome or aneurysmal changes in the one year follow-up period. Study authors noted that one benefit of pAVF over sAVF is the potential for multiple outflow cannulation veins, as compared to a sAVF in the same location, where the median cubital vein is ligated to augment flow into a single vessel.

Another study provided was a retrospective cohort study of 232

[171] Hull JE, Deitrick J, Groome K, ''Maturation for Hemodialysis in the Ellipsys® EndoAVF Post-Market Registry,'' *Journal of Vascular and Interventional Radiology* 2020; 31(9): 1373–1381. (Published on-line August 13, 2020.)

[172] Beathard et al., ''Two-year cumulative patency of endovascular AVF'' JVA 2020; 21: 350–356.

[173] Hebibi et al, ''Clinical hemodialysis experience with percutaneous arteriovenous fistulas created using the Ellipsys® vascular access system,'' *Hemodialysis International* 2019; 23(2): 168–172.

consecutive patients who underwent pAVF creation with Ellipsys at a single center in France.[174] An Ellipsys pAVF was the second choice after a radiocephalic surgical wrist fistula. Patients were 63 percent male, with a mean age of 64 years old (25–92). Balloon angioplasty was considered part of the index procedure and performed in all cases. Technical success was achieved in 99 percent. At 1 year, the primary patency rate was 54 percent and the secondary patency rate was 96 percent with a mean follow up of 252 days. The most frequent intervention (35 percent of patients) was additional balloon angioplasty. Eleven percent of patients underwent procedures for superficialization of deep veins. Average maturation time by clinical or ultrasound criteria was 4 weeks, and successful cannulation was established in less than 2 weeks in 10 percent of patients. No significant adverse events related to the procedures occurred. Three patients (1 percent) required later conversion to sAVF, two due to occlusion of the anastomosis and one due to rupture of the perforator during an angioplasty procedure and pseudoaneurysm. The authors conclude that pAVFs have reduced need for reinterventions and result in a moderate-flow fistula with shared venous drainage. They further state that minimally invasive AVF creation with the low risk of complications seen using Ellipsys can be particularly beneficial in older patients, especially since the lower flow fistula as compared to brachial artery inflow AVFs decreases the risk of cardiac issues. They conclude that large-scale randomized studies are needed to confirm their findings.

In another study, a case series of 14 patients who achieved early cannulation with an Ellipsys pAVF underwent retrospective review at an outpatient department in Europe.[175] In these patients, cannulation within 14 days post creation was performed using plastic cannulas in order to avoid catheter insertion or replacement for dialysis. The procedure was successful in all except one case. Primary patency at 12 months was 66 percent and cumulative patency was 100 percent, with the authors concluding that this success suggests that pAVF could serve as an alternative to catheter for immediate dialysis.

The applicant also submitted preliminary unpublished results from a 3-year follow up of 99 of the pivotal trial patients, stating that while Ellipsys AVFs required more maturation procedures, in the 2 years following creation they required fewer maintenance procedures as compared to results for sAVF reported in the literature, with an average of 0.83 vs. 3.41, respectively. Additionally, they stated that at every follow-up period, Ellipsys showed improved cumulative patency over sAVF results from the literature, with rates of 90 percent vs 46 percent at 36 months.

The applicant summarized results from all of the studies to support each claim of Ellipsys's superiority over sAVF by comparing to historical controls in the literature. For the claim of more clinically functional AVFs, the applicant summarized results from 4 studies, demonstrating 2NC in 88 percent at one year and 95 percent at 2 years, 87 percent with an average follow up of 282 days, and 82 percent within 6 weeks.[176] [177] [178] [179] This was compared to a value of 53.4 percent successful cannulation for sAVF from a study that looked at the effect of age over 65 on clinical outcomes for radiocephalic and brachiocephalic AVF.[180] For the claim of decreased time to 2NC, the applicant summarized the results from 5 studies, demonstrating a mean time to 2NC for Ellipsys of 100.2 days, 65.5 ± 45.7 days, a range of 10 days to 6 weeks, 4 weeks, and 60 days.[181] [182] [183] [184] [185] This was compared to a mean of 136 days for sAVFs, taken from the United States Renal Data System.[186] For the claim of more durable AVFs, the applicant summarized results from 5 studies demonstrating Ellipsys's cumulative patency at 12 months, ranging from 82 percent to 100 percent, and 91.6 percent at 24 months.[187] [188] [189] [190] The applicant compared these results to a patency rate of 65 percent for sAVFs found in the USRDS database.[191] The applicant further stated that preliminary results from the pivotal trial 3 year follow-up reinforce this claim, as they found that the cumulative patency using Ellipsys was 90 percent at 36 months, compared to a historical value of 46 percent for sAVFs. For the claim of decreased secondary interventions (including maturation and maintenance procedures), the applicant summarized outcomes from 3 studies demonstrating 0.96 secondary interventions per patient year in the study by Shahverdyan et al.; 2.63 interventions per year in the pivotal trial; and an average of 0.83 maintenance inventions per patient in the 2 years following creation in the preliminary results of the 3 year follow-up by Hull et al. The applicant stated that a comparable value for sAVFs is

3.41 over 2 years.[192] Finally, for the claim of patient satisfaction, the applicant cited results of the patient survey performed by Beathard et al., stating that the survey indicated a high level of satisfaction with Ellipsys, with 93 percent rating their access as very good or excellent, and 95 percent rating their lack of pain as very good or excellent. Additionally, patients noted the lack of scar, short recovery time, and ease of use with Ellipsys.[193]

We note that only one of the studies submitted by the applicant in support of a finding of substantial clinical improvement for Ellipsys has a comparator arm (retrospective comparison), and none were created with a methodology to demonstrate superiority. In addition, some studies may be limited by potential bias due to single operator and/or single site design, and comparisons to sAVF were made using various historical controls from different studies with no statistical analyses, making it difficult to account for confounding variables. We further note that the studies used physiologic endpoints as a surrogate outcome for fistula maturity instead of a clinically functional fistula as determined by successful 2-needle cannulation. Of interest, a number of the studies submitted concluded that there is a further need for head-to-head, larger scale, or longer trials to confirm claims of superiority of pAVF over surgical AVF and other pAVF devices. We note that the applicant provided one retrospective study with a small sample size to support the claim of superiority of Ellipsys over WavelinQ. Though this study by Shahverdyan et al. demonstrated numerically better outcomes for multiple endpoints with Ellipsys, we note that outcomes did not reach statistical significance for primary patency, technical success, maturation rates, time to cannulation, or fistula success, and we note the potential for bias with the single operator/single site study design.

We note that the decreased interventions and time to 2NC using Ellipsys were reported from studies performed outside of the US, where practice patterns are different. Per the Hull et al. study, practice in the US is to direct flow into a single upper arm vein to meet established guidelines for fistula flow diameter depth and length, whereas in the European studies, multiple outflow veins were accepted.[194] The authors further state that allowing multiple outflow veins decreases the number of secondary maturation procedures used to direct flow, but requires advanced cannulation techniques, ultrasound guidance, and plastic access cannulas that are not available in the US. These techniques and the use of plastic cannulas also allow for early cannulation of the fistula in European studies. For these reasons, we question whether the European results are generalizable to the US population.

When comparing the new protocol for Ellipsys (always performing balloon angioplasty) to the De Novo protocol (sometimes performing balloon angioplasty), Ellipsys demonstrated a reduced number of maturation procedures and faster time to cannulation; however, more maintenance procedures were required than the De Novo protocol. In addition, the investigators did not account for potential confounding variables between the different studies, which could have affected outcomes in order to compare the two studies used to claim superiority. We further note that previously, balloon angioplasty was nearly always performed, whether as part of the index procedure, as a maturation procedure, or as a maintenance procedure, and it continued to be a necessary secondary intervention after adoption of the new procedural step.

We are inviting public comments on whether the Ellipsys® Vascular Access System demonstrates improvement over each of the three comparators and meets the substantial clinical improvement criterion.

We received public comments in response to the New Technology Town Hall meeting regarding the application of the Ellipsys® Vascular Access System for new technology add-on payments.

Comment: The applicant submitted a public comment providing an additional study and addressing questions posed at the town hall meeting. The study provided is a single-center retrospective comparison article in press of Ellipsys and sAVF by Harika et al. 107 patients who received pAVF with Ellipsys at this center between May 2017 and May 2018 were compared to an equal number of consecutive patients who received a surgical fistula in the same time period. Patients with grafts or lower extremity fistulae were excluded and baseline characteristics and demographics were comparable between groups. All pAVFs were created by a single surgeon, while the sAVFs were created by 4 surgeons. Primary outcomes were primary and secondary patency rates, as well as maturation as determined by AVF utilization, or >4mm diameter and >500ml/lt flow for pre-dialysis patients. Secondary outcomes assessed secondary interventions and rate of complications. Per the applicant, at 6 weeks, pAVF maturation rates were higher compared to the sAVF arm (65 percent vs 50 percent, p=0.01). In addition, primary patency in the sAVF group was higher than pAVF at 12 months (86 percent vs 61 percent, p<0.01) but comparable at 24 months (52 percent vs 55 percent, p=0.48), and secondary patency rates were not significantly different between groups at 12 or 24 months. Rates of secondary interventions were divided between percutaneous and surgical interventions. At 2 years, the rate of percutaneous reinterventions was similar but the sAVFs required more surgical revisions (36% vs. 17%). Differences in total interventions between groups did not reach statistical significance at 12 and 24 months. The study authors conclude that pAVF's better aesthetic result, short procedure time, and ability to perform easily in an outpatient office procedure center indicates that Ellipsys has many benefits, but large prospective randomized multicenter studies are needed to confirm the outcomes demonstrated in this study.[195]

In response to a question regarding the need for a head-to-head comparison between WavelinQ and Ellipsys to determine superiority, the applicant stated that there are no randomized controlled trials available but the study (summarized previously) by Shahverdyan et al. provides a reasonable comparison of the two. Per the applicant, the algorithm to choose which procedure to perform reflected ''real-world'' choices, and the results demonstrated that Ellipsys offers substantial clinical improvement over WavelinQ. In response to a comment questioning the available 2-year data using the current version of Ellipsys, the applicant stated that the 2-year follow up study (Beathard et al.) of the pivotal trial captured results of patients treated with immediate angioplasty, as that was done in 19 percent of patients even

[194] Hull et al., ''Maturation for Hemodialysis in the Ellipsys EndoAVF Post-Market Registry,'' *Journal of Vascular and Interventional Radiology* 2020; 31(9): 1373–1381. (Published on-line August 13, 2020.)

[195] Harika G, et al., ''Comparison of surgical versus percutaneously created arteriovenous hemodialysis fistulae,'' *Journal of Vascular Surgery* 2020; accepted for publication December 5, 2020, in press.

before the procedural change. The applicant further stated that the current version of Ellipsys differs only by the addition of this procedural step, and studies after the pivotal trial adopted this practice to better results, with this combination of results indicating that the balloon angioplasty step improves outcomes over a multi-year period. In addition, the applicant stated that the Harika et al. study (summarized previously) had a 2-year study period, and all patients had immediate balloon angioplasty. In response to a question regarding the comparability of pAVF in the proximal radial artery with a sAVF in the same location, the applicant stated though they are created differently, they are functionally comparable once mature, and neither typically requires superficialization.

Next, in response to a question regarding what the fewer short-term complications using Ellipsys are as compared to sAVF, the applicant stated that these include lower wound morbidity due to minimal incisions, fewer aneurysms, avoidance of vasospasm, and lower incidence of clinically significant steal syndrome. The applicant stated that in sAVF, clinically significant steal syndrome can occur in as many as 11 percent of cases, but it is rare in reports of pAVFs placed with Ellipsys. The applicant summarized information on complications with Ellipsys from the studies previously discussed and stated that (1) Harika et al [196] reported that sAVFs had a substantially higher rate of wound healing and infections, as well as more occurrences of steal syndrome and aneurysm; (2) Hull et al's prospective safety and efficacy study [197] examined possible complications in detail and most complications did not appear at all; (3) the Ellipsys pivotal trial [198] reported no complications due to vessel perforation, dissection, or distal embolization were reported; (4) in the Hull et al. Maturation Study,[199] several adverse events were reported including one hematoma, one arm swelling, and one case of steal syndrome; and (5) Mallios et al's report on mid-term results [200] reported no complications, other than cases treated with balloon angioplasty and one case of arm swelling.

The applicant also addressed a final question in its public comment regarding the definition of improved durability. The applicant stated that this is an umbrella term used to reflect the useful life of an AVF for dialysis, and can include different patency measures.

Response: We thank the applicant for its comments and will take this information into consideration when deciding whether to approve new technology add-on payments for the Ellipsys® Vascular Access System. With regard to the Harika et al. study provided, we note that prespecified subgroup analyses of pAVF vs elbow fistulae (e-AVF) and pAVF vs wrist fistulae were also compared, with elbow fistula considered to be the most similar comparator to ''real world'' vascular access practice patterns. When comparing outcomes between e-AVF and p-AVF groups in this study, differences in total interventions, maturation at 6 weeks, and secondary patency rates were not significantly different. e-AVF also demonstrated higher 12 month primary patency (p=0.02). We further note that though the applicant asserted that Ellipsys decreases the need for secondary interventions as compared to sAVF, this study did not demonstrate a statistically significant difference between arms for total interventions at 12 or 24 months, and we are concerned that this may not demonstrate a substantial clinical improvement for Ellipsys over sAVF.

Comment: Another public comment was submitted in response to the Town Hall meeting. The commenter stated that during the FY 2022 New Technology Town Hall Meeting, Avenu Medical relied upon a single published study to support claims of substantial clinical improvement for Ellipsys over WavelinQ. Per the commenter, this study indicated that limitations of the review include those of any retrospective analysis on nonrandomized data and possible selection bias.[201] Per the commenter, the authors of the study concluded that both of the devices had high technical success rates and adequate flow volumes, as well as no significant difference in primary patency, and that the devices may serve different patient populations, since patients can be anatomically eligible for one or the other. The commenter concludes that it is important that both technologies are available as treatment options for Medicare beneficiaries and they believe CMS should consider new technology add-on payments for the two pAVF systems together. They also stated that CMS should designate a new technology add-on payment category for devices used in percutaneous creation of an AVF.

Response: We thank the commenter for their input and will take this information into consideration when deciding whether to approve new technology add-on payments for the Ellipsys® Vascular Access System. We note that we are unclear with regard to the commenter's request for a new technology add-on payment category, as the IPPS payment system does not utilize categories, and this request may be referring to another payment system.

g. ENSPRYNG™ (satralizumab-mwge)

Genentech, Inc. submitted an application for new technology add-on payments for the ENSPRYNG™ (satralizumab-mwge) injection (ENSPRYNG) for FY 2022. According to the applicant, ENSPRYNG is indicated by the FDA for the treatment of neuromyelitis optica spectrum disorder (NMOSD) in adult patients who are anti-aquaporin-4 (AQP4) antibody positive. ENSPRYNG is the first subcutaneous, first self-administered, and third FDA-approved drug for the treatment of this severe chronic autoimmune disease of the central nervous system.[202] The applicant states, due to the severity of relapses, relapse prevention is a key disease management priority. Patients who relapse are often admitted to the hospital for acute treatment. According to the applicant, with every relapse, patients are at risk of becoming blind or paralyzed, and thus it is critical to minimize the risk of future relapses by initiating maintenance treatment with a therapy such as ENSPRYNG in a timely manner while the patient is still

admitted. Therefore, according to the applicant, ENSPRYNG should be approved for new technology add-on payments in order to maximize the likelihood that this especially sick patient population can start the treatment they need while in the inpatient setting.

According to the applicant, NMOSD is a rare, inflammatory, potentially life-threatening autoimmune central nervous system (CNS) disorder characterized primarily by severe, unpredictable relapses of optic neuritis and/or acute longitudinally extensive transverse myelitis (LETM).[203] The applicant asserts that NMOSD has an estimated prevalence of 0.1–10 per 100,000 individuals, affecting nearly 15,000 individuals in the United States.[204] NMOSD occurs in children [205] and adults [206] of all races [207] and disproportionately affects African and Asian females aged 30 to 40 years.[208] According to the applicant, the (bilateral) optic neuritis and/or LETM that are characteristic of NMOSD result from inflammation of the optic nerve, spinal cord,[209] and brainstem,[210] but other regions of the CNS may be affected as well. The vast majority of patients (80%–90%) experience repeated relapses, and disability accumulates with each relapse.[211] Around 60% of patients relapse within one year of diagnosis, and 90% relapse within 3 years.[212] Compared with patients who experience an isolated attack, patients with relapsing disease have greater disease-related clinical burden, and upward of 83% of patients do not fully recover after subsequent relapses.[213]

According to the applicant, the negative impact of NMOSD on patient quality of life (QoL) is predominantly a result of physical disability, pain, vision impairment, and bowel and bladder dysfunction.[214] Disease-induced disability and symptoms have a considerable impact on patients' ability to work and thrive in social activities and personal relationships.[215] The applicant added that the loss of motor and sensory function leads to approximately 50% of patients requiring a wheelchair [216] and 62% of patients becoming functionally blind [217] within 5 years of diagnosis.[218] Therefore, according to the applicant, it is critical that treatments that consistently and effectively reduce the risk of relapse are initiated rapidly in patients diagnosed with NMOSD.

With respect to the newness criterion, ENSPRYNG received FDA BLA approval on August 14, 2020. The applicant added that ENSPRYNG was granted Fast Track designation [219] and Breakthrough Therapy designation [220] by the FDA. The applicant stated that ENSPRYNG was not commercially available until August 24, 2020 because the applicant had to wait for final approval for printing and labeling as well as customs and importation. The recommended loading dosage of ENSPRYNG for the first three administrations is 120 mg by subcutaneous injection at Weeks 0, 2, and 4, followed by a maintenance dosage of 120 mg every four weeks. The applicant submitted a request for an ICD–10–PCS code to uniquely identify the administration of ENSPRYNG beginning FY 2022.

As discussed earlier, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposed of new technology add-on payments. The applicant stated that there are limited treatment guidelines available for NMOSD with the most recent US guidelines published in 2012. These US NMOSD treatment guidelines exclusively recommend off-label drugs: Azathioprine, with or without prednisone; mycophenolate mofetil, with or without prednisone; rituximab; or prednisone alone.[221] The applicant stated that there are presently two other FDA-approved therapies for patients with AQP4-IgG positive NMOSD: SOLIRIS (eculizumab),[222] which was approved in 2019, and UPLIZNA (inebilizumab-cdon), which was approved in 2020.[223]

With regard to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, the application stated that ENSPRYNG is an interleukin-6 (IL–6) receptor antagonist indicated for the treatment of NMOSD in adult patients who are AQP4-IgG positive.[224] According to the applicant, ENSPRYNG targets soluble and membrane-bound IL–6 receptors to inhibit IL–6 signaling and subsequently disrupt downstream inflammatory

[222] SOLIRIS (eculizumab) [prescribing information]. Boston, MA: Alexion Pharmaceuticals, Inc.; 2019.

[223] UPLIZNA (inebilizumab) [prescribing information]. Gaithersburg, MD: Viela Bio, Inc.; 2020.

[224] ENSPRYNG (satralizumab) [prescribing information]. South San Francisco, CA: Genentech USA, Inc.; 2020.

effects that contribute to the pathophysiology of NMOSD; [225] ENSPRYNG dissociates from the IL–6 receptor at an acidic pH within endosomes and is recycled to circulation, prolonging the plasma half-life of the drug.[226]

The applicant next identified other drugs used to treat NMOSD and their corresponding mechanisms of action. According to the applicant, these current treatments include: SOLIRIS, for which a precise mechanism of action is unknown but is presumed to involve inhibition of AQP4-IgG-induced terminal complement C5b-9 deposition; [227] UPLIZNA, for which a precise mechanism of action is unknown but is presumed to involve binding to CD19, a surface antigen present on pre-B and mature B cells; [228] azathioprine, for which a precise mechanism of action is unknown; [229] Rituxan, which targets CD20 antigen on B cells and leads to profound B cell depletion, principally over an antibody-dependent cell cytotoxicity mechanism; [230] mycophenolate mofetil, which is an immunosuppressive and an inhibitor of inosine monophosphate dehydrogenase and therefore of the guanosine nucleotide synthesis pathway upon which T and B cells depend; [231] and prednisone, which is a synthetic adrenocortical steroid drug with predominately corticosteroid properties.[232] The applicant concluded that none of these current drugs are characterized by their binding and blocking of soluble and membrane-bound IL–6 receptors to inhibit IL–6 signaling. Therefore, the applicant believes ENSPRYNG has a unique and distinct mechanism of action.

With respect to the second criterion, whether a product is assigned to the same or different MS–DRG, the applicant acknowledged that ENSPRYNG may be assigned to the same MS–DRG when compared to existing technology. Per the applicant, cases representing patients who may be eligible for treatment with ENSPRYNG map to MS–DRGs 058, 059, and 060. With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant stated that the use of ENSPRYNG may not involve the treatment of the same or similar patient population when compared with an existing technology because: (1) Current technologies such as SOLIRIS may be contraindicated in patients with unresolved serious *Neisseria meningitidis* infections; and (2) SOLIRIS and UPLIZNA are administered as IV infusions which not all patients may be willing to receive.

In summary, the applicant asserts ENSPRYNG meets the newness criterion because it is the only treatment for NMOSD that works specifically by suppressing IL–6 signaling, and because it may not involve the treatment of the same or similar patient population as existing technology. We note that the applicant states that the use of ENSPRYNG may not involve treatment of the same or similar patient population when compared to SOLIRIS with regard to the treatment of patients with unresolved serious *Neisseria meningitidis* infection and with regard to the treatment of patients unwilling to receive an IV infusion. However, we question if UPLIZNA may also be a treatment option for patients with meningococcal disease. We further question whether patients who are unwilling to receive an IV infusion would constitute a new patient population for NMOSD. We invite public comment on whether ENSPRYNG involves the treatment of the same or similar patient population when compared to existing technologies.

We are inviting public comments on whether ENSPRYNG is substantially similar to other technologies and whether ENSPRYNG meets the newness criterion. With regard to the cost criterion, the applicant provided two cost analyses, with the first being an update of the analysis used in FY 2021 by the applicant for SOLIRIS, which is also indicated for NMOSD, and the second which is specific to ENSPRYNG.

Under the first analysis, the applicant searched the FY 2019 MedPAR database for cases reporting ICD–10–CM code G36.0 in the primary and/or admitting position, which resulted in 583 cases. The applicant imputed one case where an MS–DRG had a case volume lower than 11, resulting in 556 cases mapping to 30 MS–DRGs. The applicant stated that it restricted the analysis to MS–DRGs 058, 059, and 060, which accounted for 92.1% of all cases identified. The applicant also excluded cases that were not included in the FY 2021 Proposed Rule Impact File from this analysis, resulting in a final case count of 466 cases mapping to three MS–DRGs. Using a CCR of 0.343 (national other services average CCR), the applicant then removed all charges in the drug cost center, all charges in the blood cost center, and an additional $12,000 of cost for plasma exchange procedural costs for cases with non-zero charges in the blood cost center, for charges for related and prior technologies. The applicant applied an inflation factor of 13.1%, which per the applicant is the outlier charge inflation factor used in the FY 2021 IPPS/LTCH PPS final rule, to update the standardized charges from FY 2019 to FY 2021. We note that the applicant appears to have used the FY 2021 IPPS/LTCH PPS proposed rule inflation factor rather than the 2-year inflation factor from the FY 2021 IPPS/LTCH PPS final rule of 13.2 percent (85 FR 59038), which would have increased the inflated charges. Finally, the applicant added charges for the technology by multiplying the cost of ENSPRYNG, based on an average of 1.22 doses per patient, by the inverse of the national average drug CCR of 0.187 from the FY 2021 IPPS/LTCH PPS final rule (85 FR 58601). The applicant calculated a final inflated average case-weighted standardized charge per case of $150,154, which exceeds the case-weighted threshold of $47,813.

For the second analysis, the applicant used the same sample of cases (466) from the first analysis, as identified in the FY 2019 MedPAR database with the ICD–10–CM code G36.0 and with the same sample restrictions. In this analysis, the applicant did not remove charges for related or prior technologies because, per the applicant, ENSPRYNG is anticipated to neither replace plasma exchange nor be used as a monotherapy in all patients. The applicant standardized and inflated the charges, as well as added charges for ENSPRYNG using the same methodology as the first analysis, described previously. The applicant calculated a final inflated

average case-weighted standardized charge per case of $175,021, which exceeded the case-weighted threshold of $47,813. The applicant asserted that ENSPRYNG meets the cost criterion based on these analyses.

Based on the information provided by the applicant, it is uncertain to us why the national other services average CCR was used to inflate costs to charges in the first analysis when the applicant indicated that it removed charges from the drugs cost center and blood cost center. We are seeking public comment on whether this or another CCR, such as a CCR for drugs or blood and blood products, would be more appropriate. Furthermore, in the event that a MS–DRG has fewer than 11 cases, the applicant should impute a minimum case number of 11. We are inviting public comments on whether ENSPRYNG meets the cost criterion, including whether the use of another CCR would substantially alter the results of the applicant's analysis.

With regard to the substantial clinical improvement criterion, the applicant asserts that ENSPRYNG represents a substantial clinical improvement in the following ways: (1) It significantly improves clinical outcomes relative to services or technologies previously available for the treatment of NMOSD in adult patients who are AQP4-IgG positive; (2) these improvements are not accompanied by serious safety concerns; (3) ENSPRYNG is the only FDA-approved treatment for NMOSD that is subcutaneously administered; [233] and (4) the totality of circumstances demonstrates ENSPRYNG, relative to technologies previously available, substantially improves the treatment of Medicare beneficiaries. The applicant submitted two recent studies to support their claims of substantial clinical improvement over existing technologies.

The SAkuraStar (NCT02073279) [234] study was a Phase 3, double-blind, placebo-controlled, parallel-group trial at 44 investigational sites in 13 countries to assess the safety and efficacy of ENSPRYNG monotherapy in patients with NMOSD. 95 (57%) of 168 screened participants aged 18–74 years with AQP4-IgG positive or negative NMOSD met the inclusion criteria and were randomly assigned (2:1) to treatment with ENSPRYNG 120mg (n=63) or visually matched placebo (n=32). Inclusion criteria included participants who had experienced at least one documented NMOSD attack or relapse in the previous 12 months and had a score of 6.5 or less on the Expanded Disability Status Scale, while exclusion criteria included clinical relapse 30 days or fewer before baseline. The primary endpoint was time to the first protocol-defined relapse, based on the intention-to-treat (ITT) population (AQP4-IgG positive and negative) (n=95), and analyzed with stratification for two randomization factors (previous therapy for prevention of attacks and nature of the most recent attack). Treatment in both arms was given subcutaneously at weeks 0, 2, 4, and every 4 weeks thereafter. The double-blind phase was due to last until 44 protocol-defined relapses occurred or 1.5 years after random assignment of the last patient enrolled, whichever occurred first. Participants could enter an open-label phase after the occurrence of a protocol-defined relapse or at the end of the double-blind phase. Protocol-defined relapses occurred in 19 (30%) patients receiving satralizumab and 16 (50%) receiving placebo (hazard ratio 0.45, 95% CI 0.23–0.89; p=0.018). 473.9 adverse events per 100 patient-years occurred in the satralizumab group and 495.2 per 100 patient-years in the placebo group. The authors noted that the incidence of serious adverse events and adverse events leading to withdrawal was similar between groups.

According to the applicant, this study demonstrated that the time to the first relapse was significantly longer in ENSPRYNG-treated patients compared with patients who received a placebo (risk reduction, 55%; hazard ratio, 0.45 (95% CI 0.23, 0.89); p = 0.0184). In the AQP4-IgG positive population, there was a 74% risk reduction and a hazard ratio of 0.26 (95% CI 0.11, 0.63; p = 0.0014). The results in the subgroup of AQP4-IgG negative patients were not statistically significant.[235] [236] The annualized relapse rate for AQP4-IgG positive patients was 0.1 (95% CI, 0.05–0.2) in the ENSPRYNG group and 0.5 (95% CI, 0.3–0.9) in the placebo group.[237] The proportion of relapse-free AQP4-IgG positive patients at week 96 was 77% in the ENSPRYNG group and 41% in the placebo group.[238] According to the applicant, the study concluded that ENSPRYNG monotherapy reduced the rate of NMOSD relapse compared with placebo in the overall trial population and had a favorable safety profile.

In the second Phase 3, randomized, double-blind, placebo controlled study submitted by the applicant, the SAkuraSky (NCT02028884) [239] trial, 83 patients with NMOSD who were seropositive or seronegative for AQP4-IgG were randomly assigned (1:1) to receive either 120 mg of satralizumab (n=41) or placebo (n=42) administered subcutaneously at weeks 0, 2, and 4 and every 4 weeks thereafter, in addition to stable IST. The primary end point was the first protocol-defined relapse in a time-to-event analysis. Key secondary end points were the change from baseline to week 24 in the visual-analogue scale (VAS) pain score (range, 0 to 100, with higher scores indicating more pain) and the Functional Assessment of Chronic Illness Therapy-Fatigue (FACIT–F) score (range, 0 to 52, with lower scores indicating more fatigue). Safety was also assessed.

The results of the SAkuraSky trial demonstrated that the median treatment duration with satralizumab in the double-blind period was 107.4 weeks. Relapse occurred in 8 patients (20%) receiving satralizumab and in 18 (43%) receiving placebo (hazard ratio, 0.38; 95% confidence interval [CI], 0.16 to 0.88). Multiple imputations for censored data (including patients who discontinued the trial, received rescue therapy, had a change in baseline treatment, or were continuing in the

[238] Traboulsee A, Greenberg BM, Bennett JL, et al. Safety And Efficacy of Satralizumab Monotherapy In Neuromyelitis Optica Spectrum Disorder: A Randomised, Double-Blind, Multicentre, Placebo-Controlled Phase 3 Trial. Lancet Neurol. 2020;19(5):402–412. doi:10.1016/S1474–4422(20)30078–8.

[239] US Department of Health and Human Services. Active Study √ Neuromyelitis Optica Spectrum Disorder. *https://clinicaltrials.gov/ct2/results?cond=&term=NCT02028884&cntry=&state=&city=&dist=*. Accessed August 14, 2020.

trial at the data-cutoff date) resulted in hazard ratios ranging from 0.34 to 0.44 (with corresponding P values of 0.01 to 0.04). Among the 55 AQP4-IgG–seropositive patients, relapse occurred in 11% of those in the satralizumab group and in 43% of those in the placebo group (hazard ratio, 0.21; 95% CI, 0.06 to 0.75); among 28 AQP4-IgG–seronegative patients, relapse occurred in 36% and 43%, respectively (hazard ratio, 0.66; 95% CI, 0.20 to 2.24). The between-group difference in the change in the mean VAS pain score was 4.08 (95% CI, −8.44 to 16.61); the between-group difference in the change in the mean FACIT–F score was −3.10 (95% CI, −8.38 to 2.18). The rates of serious adverse events and infections did not differ between groups.

In support of the applicant's claim that ENSPRYNG significantly improves clinical outcomes relative to services or technologies previously available for the treatment of NMOSD in adult patients who are AQP4-IgG positive, the applicant stated that patients treated with ENSPRYNG plus IST exhibited a significantly longer time to first relapse when compared to placebo. This also included a risk reduction of 62% in patients treated with ENSPRYNG plus IST when compared with patients who received a placebo plus IST and a 79% risk reduction in the AQP4-IgG positive population. Results in the AQP4-IgG negative patient subgroup were not statistically significant.[240] The proportion of relapse free AQP4-IgG positive patients at week 96 was 92% in ENSPRYNG plus IST group and 53% in the placebo plus IST group.[241]

According to the applicant's second claim, substantial improvements in clinical efficacy are not accompanied by serious concerns. In the SAkuraSky trial, 90% of patients in the ENSPRYNG plus IST group had at least one adverse event compared to 95% in the placebo plus IST group.[242] The safety profile of ENSPRYNG in the OST period was consistent with the double-blind period. There were no deaths or anaphylactic reactions, rates of AEs and serious AEs did not increase with longer exposure to ENSPRYNG; and the most frequently reported AEs in the OST period were consistent with the double-blind period.[243]

The applicant's third claim concerns the flexibility provided to patients by the option to self-administer ENSPRYNG. According to the applicant, ENSPRYNG is the only FDA-approved treatment for NMOSD that is administered subcutaneously.[244] Once treatment is initiated during inpatient hospital admission, upon discharge and having received adequate training on how to perform the injection, an adult patient/caregiver may administer all subsequent doses of ENSPRYNG at home if the treating physician determines that it is appropriate and the adult patient/caregiver can perform the injection technique. According to the applicant, self-administration provides the patient the option to continue the therapy initiated in the hospital while in the convenience of their own home, with reduced disruption to daily life. The applicant states that additionally, the option to self-administer provides flexibility to patients, as they can bring their medication with them while traveling without having to worry if there is an infusion site nearby. The applicant claims this may potentially reduce the rate of hospital readmissions.

In their fourth claim, the applicant states the totality of circumstances otherwise demonstrate that ENSPRYNG, relative to technologies previously available, substantially improves the treatment of Medicare beneficiaries. The applicant asserts that a cross trial comparison between ENSPRYNG and SOLIRIS (approved for new technology add-on payment in FY 2021) cannot be made due to differences in trial design and study population. However, the applicant noted the following distinctions between ENSPRYNG and SOLIRIS and their clinical trials. Per the applicant, the first distinction is that in the registrational study for SOLIRIS, a higher proportion of patients receiving SOLIRIS than those receiving a placebo discontinued their participation in the clinical trial (17% vs 6%).[245] During the double-blind period of SAkuraSky trial, however, a total of three patients (7%) in the ENSPRYNG group and 10 patients (24%) in the placebo group discontinued the trial agent.[246] The applicant states that discontinuation of SOLIRIS may be associated with relapse and hospitalization. The second distinction made by the applicant is that the prescribing information for ENSPRYNG[247] does not bear a black-box warning, in contrast to that of SOLIRIS.[248] The third distinction is that patients must be vaccinated against *Neisseria meningitidis* before receiving SOLIRIS[249] and no such requirement applies to ENSPRYNG.[250] The fourth and final distinction made by the applicant highlights duration of treatment. In the SAkuraSky trial, the mean period of treatment in the double-blind period was 94.1±72.6 weeks in the ENSPRYNG group and 66.0±61.4 weeks in the placebo group.[251] However, the median trial durations were shorter in the SOLIRIS trial, at 90.93 and 43.14 weeks (minimum-maximum, 6.4–211.1 and 8.0–208.6) for the SOLIRIS and placebo groups, respectively.[252]

In connection with the applicant's fourth claim to support substantial clinical improvement, the applicant stated that both the SAkuraStar[253] and SAkuraSky[254] clinical trials included comparator arms. In SAkuraStar, an exclusion criterion was IST use, whereas in SAkuraSky, patients were permitted to continue baseline treatment with a stable dose of the IST agents in addition to the trial drug. This allowed the efficacy of ENSPRYNG to be assessed both in patients who were

[254] Yamamura T, Kleiter I, Fujihara K, et al. Trial of Satralizumab in Neuromyelitis Optica Spectrum Disorder. N. Engl. J. Med. 2019; 381(22)2114–2124. doi:10.1056/nejmoa1901747.

receiving one of the IST agents for their NMOSD and in the others who were receiving nothing at all. The applicant stated that in contrast, SOLIRIS was tested only in a single Phase 3 clinical trial where the primary end point was the first adjudicated relapse in the population of patients taking stable-dose IST and either SOLIRIS or placebo; the efficacy of SOLIRIS monotherapy was a sub analysis,[255] and UPLIZNA was tested only in a single Phase 3 clinical trial as a monotherapy with only a 28-week randomized, controlled period.[256] According to the applicant, ENSPRYNG has received approval by regulatory authorities in Japan,[257] Canada, and Switzerland [258] for the treatment of both adults and adolescents (12–17 years of age) with NMOSD. The applicant asserts that patients in the ENSPRYNG clinical trials likely are representative of Medicare patients despite their mean ages (45.3 years for the ENSPRYNG arm of SAkuraStar [259] and 40.8 years for the ENSPRYNG arm of SAkuraSky [260]) being less than 65, as NMOSD is so severe that patients may qualify for disability accompanied by Medicare benefits regardless of their age.[261] The applicant explained that a severe onset attack causing increased disability is reported to occur in 45% of patients with NMOSD [262] and that 52.4% of US-based NMOSD patients report severe problems with mobility,[263] which is consistent with definitions of disability used by the Social Security Administration (SSA).[264] Per the applicant, SSA maintains a list of impairments considered severe enough to prevent gainful activity. Though NMOSD is not listed, multiple sclerosis (MS) is,[265] and the two conditions are frequently confused due to similarities between clinical presentations.[266] According to the applicant, the SSA is open to allowing people to qualify for disability by showing their condition is as severe as one that is on the list.[267]

After reviewing the information submitted by the applicant as part of its FY 2022 new technology add-on payment application for ENSPRYNG, we note that while the applicant provided data comparing ENSPRYNG to placebo with or without IST, the applicant did not provide data to demonstrate improved outcomes over existing FDA approved treatments for NMOSD. While the applicant states reasons why a comparison could not be made, additional information would help inform our assessment of whether ENSPRYNG demonstrates a significant clinical improvement over existing technologies for outcomes such as time to first relapse and annual relapse rate. In addition, while we understand that there may be potential benefits related to the self-administrative delivery of ENSPRYNG, we question if the benefits are related only to the outpatient administration of the medication and whether they would demonstrate improved clinical outcomes that represent a substantial clinical improvement in the inpatient setting. We are inviting public comments on whether ENSPRYNG meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for ENSPRYNG.

h. ABECMA® (idecabtagene vicleucel)

Celgene Corporation, a wholly owned subsidiary of Bristol-Myers Squibb (BMS), submitted an application for new technology add-on payment for idecabtagene vicleucel for FY 2022. Idecabtagene viclecuel is a, B-cell maturation antigen (BCMA)-directed genetically modified autologous chimeric antigen receptor (CAR) T-cell immunotherapy for the treatment of adult patients with relapsed or refractory (RR) multiple myeloma (MM) (RRMM) who have received at least four prior therapies including an immunomodulatory agent (IMiD), a proteasome inhibitor (PI), and an anti-CD38 antibody (for example, triple-class-exposed). Idecabtagene vicleucel is expected to be a 5th line plus (5L+) treatment.

Multiple myeloma (MM) is typically characterized by the neoplastic proliferation of plasma cells producing a monoclonal immunoglobulin. The plasma cells proliferate in the bone marrow and can result in extensive skeletal destruction with osteolytic lesions, osteopenia, and/or pathologic fractures. The diagnosis of MM is often suspected because of one (or more) of the following clinical presentations:

- Bone pain with lytic lesions discovered on routine skeletal films or other imaging modalities
- An increased total serum protein concentration and/or the presence of a monoclonal protein in the urine or serum
- Systemic signs or symptoms suggestive of malignancy, such as unexplained anemia
- Hypercalcemia, which is either symptomatic or discovered incidentally
- Acute renal failure with a bland urinalysis or rarely nephrotic syndrome due to concurrent immunoglobulin light chain (AL) amyloidosis

It is important to distinguish MM both from other causes of these clinical presentations and from other plasma cell dyscrasias for the purposes of prognosis and treatment.[268] Data from the U.S. Surveillance, Epidemiology, and End Results (SEER) registry estimate 32,000 new cases of MM and

13,000 deaths from MM annually in the U.S. This correlates with an annual incidence of approximately 7 per 100,000 men and women per year. MM is largely a disease of older adults. The median age at diagnosis is 65 to 74 years. MM is also slightly more frequent in men than in women (approximately 1.4:1). MM is associated with substantial morbidity and mortality [269] and approximately 25% of patients have a median survival of 2 years or less.[270] With respect to the newness criterion, idecabtagene vicleucel received FDA approval on March 26, 2021, and has marketing authorization under the name of Abecma® and is indicated for the treatment of adult patients with relapsed or refractory multiple myeloma after four or more prior lines of therapy, including an immunomodulatory agent, a proteasome inhibitor, and an anti-CD38 monoclonal antibody. A single dose of idecabtagene vicleucel contains a cell suspension of 300 to 460 × 106 CAR T-cells.

The applicant submitted a request for unique ICD–10–PCS codes that describe the administration of idecabtagene vicleducel at the September 2020 Coordination and Maintenance Committee meeting. The following codes were approved to describe procedures involving the administration of idecabtagene vicleucel: XW033L7 (Introduction of idecabtagene vicleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7) and XW043L7 (Introduction of idecabtagene vicleucel immunotherapy into central vein, percutaneous approach, new technology group 7). These codes will be effective starting October 1, 2021.

As previously stated, if a technology meets all three of the substantial similarity criteria as previously described, it would be considered substantially similar to an existing technology and therefore would not be considered ''new'' for purposes of new technology add-on payments.

With respect to whether a product uses the same or a similar mechanism of action when compared to an existing technology to achieve a therapeutic outcome, the applicant asserts that idecabtagene viceleucel does not use the same or similar mechanism of action as other therapies approved to treat 4L+ RRMM or CAR T-cell therapies approved to treat different diseases. According to the applicant, with regard to its mechanism of action, idecabtagene viceleucel is a chimeric antigen receptor (CAR)-positive T cell therapy targeting B-cell maturation antigen (BCMA), which is expressed on the surface of normal and malignant plasma cells. The CAR construct includes an anti-BCMA scFv-targeting domain for antigen specificity, a transmembrane domain, a CD3-zeta T cell activation domain, and a 4–1BB costimulatory domain. Antigen-specific activation of idecabtagene viceleucel results in CAR-positive T cell proliferation, cytokine secretion, and subsequent cytolytic killing of BCMA-expressing cells.

According to the applicant, with respect to the non-CAR T-cell therapies to treat 4L+ RRMM, specifically Xpovio®, Blenrep, and chemotherapy, idecabtagene vicleucel's mechanism of action is different because it is a CAR T-cell therapy. The applicant states that the mechanism of action for Xpovio® is reversible inhibition of nuclear export of tumor suppressor proteins (TSPs), growth regulators, and mRNAs of oncogenic proteins by blocking exportin 1 (XPO1). XPO1 inhibition by Xpovio® leads to accumulation of TSPs in the nucleus, reductions in several oncoproteins, such as c-myc (a ''master regulator'' which controls many aspects of cellular growth regulation and cellular metabolism) and cyclin D1, cell cycle arrest, and apoptosis of cancer cells. The applicant states that Blenrep's mechanism of action is cell destruction via microtubule inhibition, where the microtubule inhibitor is conjugated to a BCMA-specific antibody (antibody-drug conjugate). The applicant further states that the mechanism of action for chemotherapy regimens generally is disruption of normal processes required for cell survival, such as deoxyribonucleic acid (DNA) replication and protein synthesis or degradation.

With respect to the mechanism of action of other currently FDA approved CAR T-cell therapies, according to the applicant, there are no other FDA approved CAR T-cell therapies that are indicated for treatment of RRMM with the same or similar mechanism of action as idecabtagene vicleucel. The applicant stated that CAR T-cell therapies employ a unique mechanism of action which modifies the patient's own T-cell to express a chimeric antigen receptor (CAR) that programs T-cells to destroy cells that express a specific target. In the case of idecabtagene vicleucel, this target is BCMA, which is a protein that is highly expressed on the surface of MM cells making it an ideal target for the treatment of MM. The applicant asserts that the key feature that distinguishes idecabtagene vicleucel from CD–19 directed CAR T-cell therapies is the BCMA targeting domain. According to the applicant, idecabtagene vicleucel's BCMA targeting domain means that idecabtagene vicleucel has a completely different mechanism of action from other currently FDA approved CAR T-cell therapies. In its application, the applicant asserted that since there are currently no FDA approved anti-BCMA CAR T-cell therapies, if approved, idecabtagene vicleucel is the first CAR T-cell therapy approved for the treatment of RRMM and the only approved CAR T-cell therapy with a BCMA targeting domain which makes it unique as compared to other currently approved FDA therapies used to treat RRMM.

With regard to whether a product is assigned to the same DRG when compared to an existing technology, the applicant stated that it expects that cases involving the administration idecabtagene vicleucel will be assigned to the same MS–DRG, MS–DRG 018 (Chimeric Antigen Receptor (CAR) T-cell Immunotherapy), as other CAR T-cell therapies.

With regard to whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population when compared to an existing technology, the applicant asserted that, if FDA approved, idecabtagene vicleucel will be the first and only anti-BCMA CAR T-cell therapy available to treat RRMM. The applicant further asserted that idecabtagene vicleucel would be indicated for a broader population than other currently FDA-approved available therapies, specifically multiple myeloma patients having received four prior therapies.

In summary, according to the applicant, because idecabtagene vicleucel has a unique mechanism of action when compared to other currently FDA approved treatments for RRMM, and does not involve the treatment of the same or similar type of disease (RRMM) or the same or similar patient population (triple-class-exposed adult patients with RRMM), the technology is not substantially similar to an existing technology and therefore meets the newness criterion. However, we question whether idecabtagnene vicleucel's mechanism of action may be similar to that of ciltacabtagene autoleucel, another CAR T-cell therapy for which an application for new technology add-on payments was

[269] R?owan AJ, Allen C, Barac A, et al. Global Burden of Multiple Myeloma: A Systematic Analysis for the Global Burden of Disease Study 2016. JAMA Oncol. 2018;4(9):1221–1227. doi:10.1001/jamaoncol.2018.2128.

[270] Biran, N., Jagannath, S., Risk Stratification in Multiple Myeloma, Part 1: Characterization of High-Risk Disease 2013. Clinical Adv in Hematology & Oncology 11(8); 489–503.

submitted for FY 2022 as discussed previously. Both idecabtagene vicleucel and ciltacabtagene autoleucel seem to be intended for similar patient populations; multiple myeloma patients with three or more prior therapies, and would involve the treatment of the same conditions; adult patients with relapsed or refractory multiple myeloma. We are interested in information on how these two technologies may differ from each other with respect to the substantial similarity criteria and newness criterion, to inform our analysis of whether idecabtagene vicleucel and ciltacabtagne autoleucel, if approved by July 1, 2021, are substantially similar to each other and therefore should be considered as a single application for purposes of new technology add-on payments.

We are inviting public comments on whether idecabtagene vicleucel is substantially similar to an existing technology and whether it meets the newness criterion.

With regard to the cost criterion, the applicant searched the FY 2019 MedPAR correction notice (December 1, 2020) file to identify potential cases representing patients who may be eligible for treatment using idecabtagene vicleucel. In its analysis, the applicant identified a primary cohort to assess whether this therapy met the cost criterion. The following ICD–10–CM diagnosis codes were used to identify claims involving multiple myeloma procedures.

ICD-10-CM Code	Code Description
C90.00	Multiple myeloma not having achieved remission
C90.02	Multiple myeloma in relapse

The applicant chose to limit its analysis to MS–DRG 016 (Autologous Bone Marrow Transplant W CC/MCC or T-Cell Immunotherapy, MS–DRG 840 (Lymphoma & Non-Acute Leukemia W MCC) and MS–DRG 841 (Lymphoma & Non-Acute Leukemia W CC). The claim search conducted by the applicant resulted in 1,955 claims mapped to MS–DRG 016, MS–DRG 840 and MS–DRG 841 using the FY 2019 MedPAR. The applicant determined an average unstandardized case weighted charge per case of $1,237,393. The applicant used the MS–DRG–018 New Technology Threshold for FY 2022 from the FY 2021 IPPS/LTCH PPS final rule.

The applicant removed all charges in the drug cost center for the prior technology because, according to the applicant, it is not possible to differentiate between different drugs on inpatient claims. The applicant added that this is likely an overestimate of the charges that would be replaced by the use of idecabtagene vicleucel. The applicant then standardized the charges using the FY 2019 final rule impact file. Next, the applicant applied the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges (1.13218). To calculate the charges for the new technology, the applicant used a national average CCR for the CAR T-cell therapies of 0.295. To determine this alternative CCR for CAR T-cell therapies, the applicant referred to the FY 2021 IPPS/LTCH PPS final rule AOR/BOR file and calculated an alternative markup percentage by dividing the AOR drug charges within DRG 018 by the number of cases to determine a per case drug charge. The applicant then divided the drug charges per case by $373,000, the acquisition cost of YESCARTA and KYMRIAH. The applicant calculated a final inflated average case-weighted standardized charge per case of $1,329,540, which exceeded the average case-weighted threshold amount of $1,251,127 by $78,413. The applicant stated that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the therapy meets the cost criterion.

As noted in previous discussions, the submitted costs for CAR T-cell therapies vary widely due to differences in provider billing and charging practices for this therapy. Therefore, with regard to the use of this data for purposes of calculating a CAR T-cell CCR, we are uncertain how representative this data is for use in the applicant's cost analyses given the potential for variability.

We continue to be interested in public comments regarding the eligibility of CAR T-cell technologies for new technology add-on payments when assigned to MS–DRG 018. As we have noted in prior rulemaking with regard to the CAR T-cell therapies (83 FR 41172 and 85 FR 58603 through 58608), if a new MS–DRG were to be created, then consistent with section 1886(d)(5)(K)(ix) of the Act, there may no longer be a need for a new technology add-on payment under section 1886(d)(5)(K)(ii)(III) of the Act.

We invite public comment on whether idecabtagene vicleucel meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that it believes that idecabtagene vicelucel represents a substantial clinical improvement over existing technologies because: (1) The totality of the circumstances regarding idecabtagene vicleucel's clinical efficacy, safety, and data make clear that idecabtagene vicleucel substantially improves, relative to services or technologies currently available, the treatment of Medicare beneficiaries with RRMM; (2) idecabtagene vicleucel has superior effectiveness compared to existing therapies; (3) idecabtagene vicleucel fills an unmet need as demonstrated by the patient population in its registrational study, which is reflective of real-world RRMM patients and (4) idecabtagene vicleucel improves quality of life for patients with RRMM.

In support of its assertion that the totality of the circumstances regarding idecabtagene vicleucel's clinical efficacy, safety, and data make clear that idecabtagene vicleucel substantially improves, relative to services or technologies currently available, the treatment of Medicare beneficiaries with RRMM, the applicant cited results from the KarMMA study, a single-arm, open-label, phase 2 trial of idecabtagene vicleucel. The primary outcome measure for the KarMMA study was overall response rate (ORR). Secondary endpoints were; complete response rate (CRR) (key secondary; null hypothesis ≤10%), safety, duration of response (DOR), progression-free survival (PFS), overall survival (OS), pharmacokinetics (PK), minimum residual disease (MRD), quality of life (QOL) and health economics and outcomes research (HEOR). The study enrolled 140 patients and 128 received treatment. Patients were treated at target dose between 150 and 450 x 10^6 CAR T-cells. Treated patients had received three or more prior lines of therapy including an immunomodulatory drug (IMiD), a proteasome inhibitor (PI), and an anti-CD38 antibody. All patients were refractory to the last regimen (94% were refractory to anti-CD38 and 84% were

refractory to triple therapy). Efficacy results showed an ORR of 50% for patients (n=4) receiving the target idecabtagene vicleucel dose of 150 x10^6; 68.6% for patients (n=70) receiving the target dose of 300 x10^6; 81.5% for patients (n=54) receiving the target dose of 450 x 10^6. The overall ORR for all patients (n=128) who received idecabtagene vicleucel was 73.4%.

The applicant asserts that in the KarMMA study, patients who received idecabtagene vicleucel achieved numerically superior response rates, duration of response, and overall survival compared with outcomes seen for alternative therapies (belantamab-mafodotin and selinexor) in other trials.[271] [272] [273] [274] [275] [276] Response rates, according to the applicant, were also high even in patients refractory to five therapies (defined as 2 IMiD agents, 2 PIs, and 1 anti-CD38 antibody), reflecting the novel mechanism of action, according to the applicant. The applicant asserts that compared with anti-CD–19 CAR T-cell therapies, the adverse event profile revealed low rates of grade 3+ CRS (5%) and neurotoxicity (NT) (3%).[277] According to the applicant, these safety results confirm that idecabtagene vicleucel has the potential to offer a meaningful benefit to Medicare beneficiaries. The applicant also asserts that idecabtagene vicluecel has been demonstrated to be effective and with a manageable safety profile for patients with a high-unmet need (older age, aggressive disease). The applicant asserts that the results from the pivotal KarMMa study confirm the clinical benefit of idecabtagene vicleucel in a heavily pre-treated RRMM patient population.

We note that in contrast with anti-CD–19 CAR T-cell therapies (for leukemia or lymphoma) where a high fraction of responders remained in remission even after 5 years, idecabtagene vicleucel does not appear to result in long-term remission. In the KarMMA study, among responding patients, over 75% relapsed by 20 months, with no plateauing of the response curve.[278]

To support its assertion that idecabtagene vicleucel has superior effectiveness compared to existing therapies, the applicant provided results from the KarMMa–RW study,[279] a single-arm, open-label, phase 2 trial, examining real-world treatment patterns in heavily pretreated patients with RRMM. The study also provides a comparison against outcomes in the KarMMa study. The KarMMa–RW study was conducted to assess treatment patterns in real-world RRMM patients with characteristics similar to the KarMMa population and to compare outcomes with currently available therapies in this synthetic cohort vs idecabtagene vicleucel therapy in the KarMMa study. The primary endpoint of the KarMMA–RW study was overall response rate (ORR). Secondary endpoints of the study were complete response rate (CRR), very good partial response (VGPR) rate, progression free survival (PFS) and overall survival (OS). Subgroup analyses by age, sex, double-class refractory (IMiD agents and PIs) and number of prior anti-myeloma regimens per year (≤1 per year or >1) were conducted to compare ORR and PFS between the KarMMa cohort and eligible RRMM cohort. Since complete response assessment requires a bone marrow biopsy evaluation, per International Myeloma Working Group (IMWG) uniform response criteria for multiple myeloma, when data to assess a complete response were not available in eligible RRMM cohort, analyses were summarized for VGPR or better (≥VGPR) to avoid underestimating the response in the eligible RRMM cohort.

Of 1,949 real-world RRMM patients, 1,171 were refractory to their last treatment regimen at baseline. Patients who had exposure to any BCMA-directed therapy or gene-modified therapy were excluded. Of the 1,171 patients in the refractory RRMM cohort, 528 received the next line of therapy; 643 patients were excluded due to no new treatment due to death (n = 441) and no new treatment due to no follow-up (n = 202). Of the remaining 528 patients, 190 triple class exposed patients were selected as the eligible RRMM cohort based on the KarMMa eligibility criteria. The ORR in the KarMMa and eligible RRMM cohorts was 76% and 32% (p= <0.0001), respectively. The VGPR in the KarMMa and eligible RRMM cohorts was 57% and 14% (p= <0.0001), respectively.

A matched-paired analysis was conducted and ORR was adjusted for matching. Results from the matched-paired analysis were consistent with the primary analysis: the ORR for the matched KarMMa cohort (n = 76–80) and matched eligible RRMM (n = 76–80) was 72% and 29% (p=<0.0001), respectively. According to the applicant, PFS was significantly improved in KarMMa vs the eligible RRMM cohort; median PFS was 11.3 months and 3.5 months in the KarMMa and Eligible RRMM cohorts, respectively (p= <0.0001). Median follow-up was 11.3 months (KarMMa) and 10.2 months (eligible RRMM cohort) at data cutoff. According to the applicant, OS was significantly improved in KarMMa vs the eligible RRMM cohort. OR was 18.2 months for the KarMMa cohort (across all target doses from 150–450 $\times 10^6$ CAR T-cells) and 14.7 months for the eligible RRMM cohort. The estimated 12-month probability of surviving was 80% in the KarMMa cohort and 56% in the eligible RRMM cohort. Median follow-up was 12.0 months (KarMMa) and 15.0 months (eligible RRMM cohort) among surviving patients at data cutoff.

The applicant asserts that the results from the KarMMa–RW study confirm that there is no clear standard of care for RRMM patients who received at least 3 prior therapies, including IMiD agents, PIs, and anti-CD38 antibodies. Patients in the eligible RRMM cohort received 94 different treatment regimens as next-line therapy and according to the applicant, outcomes were sub-optimal with currently available therapies in the real-world RRMM patients. The applicant asserts that significantly improved outcomes were demonstrated with idecabtagene vicleucel treatment in the KarMMa cohort vs the similar real-

[278] Ibid.

[279] Jagannath S, Lin Y, Goldschmidt H, et al. KarMMa–RW: A study of real-world treatment patterns in heavily pretreated patients with relapsed and refractory multiple myeloma (RRMM) and comparison of outcomes to KarMMa. *J Clin Oncol.* 2020;38(15_suppl):8525–8525.

world population (eligible RRMM cohort). The applicant noted that the real world myeloma patient population is older (MM incidence is known to increase with age, with over 60 percent of all new cases occurring in adults aged 65+years).[280] The applicant asserts that results were consistent across subgroups including patients aged ≥65 years.

The applicant also provided a comparison of the efficacy of idecabtagene and Xpovio® from the STORM study and Blenrep from the DREAMM–2 study. STORM is a prospective, multicenter phase 2 study of Xpovio® and dexamethasone in patients with RRMM (n=122) in the 4L+ setting. The STORM trial served as the basis for regulatory approval in the US and demonstrated the clinical efficacy and safety of Xpovio®. The ORR was 26% for patients in the STORM study vs 73% for patients treated with idecabtagene vicleucel in the KarMMa study, CR was 1% for patients in the STORM study vs 33% for patients treated with idecabtagene vicleucel in the KarMMa study, medium duration of response (mDOR) was 4.4 months for patients in the STORM study vs 10.7 months for patients treated with idecabtagene vicleucel in the KarMMa study, and PFS was 3.7 months for patients in the STORM study vs 8.8 months for patients treated with idecabtagene vicleucel in the KarMMa study. The DREAMM–2 study is a prospective, multicenter Phase 2 study of Blenrep in patients with RRMM (n=122) in the 4L+ setting. The ORR was 31% for patients in the DREAMM–2 study vs 73% for patients treated with idecabtagene vicleucel in the KarMMa study, CR was 3% for patients in the DREAMM–2 study vs 33% for patients treated with idecabtagene vicleucel in the KarMMa study, medium duration of response (mDOR) was not reached in the Blenrep group whereas it was 10.7 months for patients treated with idecabtagene vicleucel in the KarMMa study, and PFS was 2.9 months for patients in the DREAMM–2 study vs 8.8 months for patients treated with idecabtagene vicleucel in the KarMMa study.

Because idecabtagne vicleucel showed improved ORR, CR, medDOR and PFS when compared to Xpovio® and Blenrep, the applicant asserts that idecabtagne vicleucel provides a substantial clinical improvement over these existing therapies.

To support that idecabtagene vicleucel fills an unmet need as demonstrated by the patient population in its registrational study, the Phase 2 KarMMa study, the applicant asserts that in addition to showing deep and durable responses and a manageable safety profile in heavily pretreated, highly refractory RRMM patients in the context of controlled clinical studies, comparisons of outcomes in real world patients (that is, patients not enrolled in clinical trials) support the assertion that idecabtagene vicleucel offers significantly improved outcomes for RRMM compared with currently available therapies. The applicant asserts that when compared to myeloma patients generally included in clinical studies, the real world myeloma patient population is older (MM incidence is known to increase with age, with over 60 percent of all new cases occurring in adults aged ≥65 years) [281] and sicker (due to the high proportion of elderly patients in this population, those with MM commonly also have additional comorbidities associated with increased age, including conditions such as osteoporosis, arthritis, diabetes, additional malignancies, cardiovascular disease, and renal dysfunction, amongst others).[282] The applicant provided an abstract from the MAMMOTH study, a noninterventional, retrospective cohort analysis conducted to assess outcomes in patients after they become refractory to anti-CD38 monoclonal antibodies, including a subset of patients who were triple-class-exposed. Patients in STORM (analyzing Xpovio® plus dexamethasone) had an ORR of 32.8% versus 25% for patients receiving conventional care in MAMMOTH (p=0.078) and STORM patients had better OS than patients in MAMMOTH (median 10.4 vs 6.9 months) (p=0.043). The applicant asserts that these results highlight a high unmet need in a patient population refractory to anti-CD38 monoclonal antibody, including a subset of triple-class exposed patients.

To support the assertion that idecabtagene vicleucel improves quality of life for patients with RRMM, the applicant referenced idecabtagene vicleucel's impact on Health-related quality of life (HRQoL) as assessed in the KarMMa study as a secondary endpoint. HRQoL was assessed using the European Organization for Research and Treatment of Cancer (EORTC) Quality of Life C30 Questionnaire (QLQ–C30) and the EORTC Multiple Myeloma Module (MY20). The QLQ–C30 consists of 30 questions addressing 5 functional domain scales, 3 symptom scales, a Global ealth/QoL scale, and 6 single item measures.[283] The QLQ–MY20 consists of 20 questions addressing 4 myeloma-specific HRQoL domains (disease symptoms, side effects of treatment, future perspectives, and body image).[283] Primary subscales of interest were QLQ–C30 Fatigue, Pain, Physical Functioning, Cognitive Functioning, and Global Health/QoL subscales and QLQ–MY20 Symptom and Side Effects subscales. Subscales were preselected based on their relevance to this patient population. The data are based on a minimum of 10 months post-infusion. Median follow-up durations at the target dose levels of 150, 300, and 450×10^6 CAR T-cells were 17.8, 13.9, and 9.7 months, respectively. Of 140 patients enrolled in KarMMa, 128 received idecabtagene vicleucel, of whom 121 (94.5%) and 120 (93.8%) were evaluable for HRQoL by QLQ–C30 and QLQ–MY20, respectively. At baseline, idecabtagene vicleucel treated patients had less favorable scores for all QLQ–C30 domains of interest (fatigue, pain, Global Health/QoL, physical functioning and cognitive functioning) than the general population. From baseline at multiple time points through month 9 post-infusion, the applicant asserts that clinically meaningful improvements were observed in QLQ–C30 Fatigue, Pain, Physical Functioning, and Global Health subscale scores relative to baseline, as the mean score from baseline showed improvement in all domains. The applicant asserts that these results support that idecabtagene vicleucel provides meaningful improvements in HRQoL and self-reported symptoms associated with heavily pretreated RRMM and demonstrate that idecabtagene vicleucel provides meaningful improvement in both global function and symptoms related to MM.

After reviewing the information submitted by the applicant as part of its FY 2022 new technology add-on payment application for idecabtagene vicleucel, we question whether, due to the lack of randomization, there is sufficient evidence to establish the efficacy of idecabtagene vicleucel compared with current alternatives. It is unknown whether the superior

[283] Helena Maes & Michel Delforge (2015) Optimizing quality of life in multiple myeloma patients: current options, challenges and recommendations, Expert Review of Hematology, 8:3, 355–366, DOI: 10.1586/17474086.2015.1021772.

outcomes for idecabtagene vicleucel in the KarMMA study, which has not been peer-reviewed, were due to more effective therapy or other factors, such as differences in patient population or treating oncologist. We also note that the applicant chose to use ORR data as a measure of substantial clinical improvement rather than the more clinically relevant and available OS data.

We are inviting public comment on whether idecabtagene vicleucel meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Techology Add-on Payment Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for idecabtagene vicleucel.

i. INDIGO Aspiration System With Lightning Aspiration Tubing

Penumbra, Inc. submitted an application for the INDIGO® Aspiration System with Lightning Tubing (''INDIGO® with Lightning'') for FY 2022. Per the applicant, INDIGO® with Lightning is a mechanical thrombectomy aspiration system used in the treatment of pulmonary embolism, deep vein thrombosis and peripheral arterial thromboembolism that optimizes thrombus removal by differentiating between thrombus and blood.

According to the applicant, INDIGO® with Lightning performs clot detection and removal via smart technology which enables the physician to determine when the catheter is in thrombus and when it is in patent flow resulting in blood loss reduction through intermittent aspiration mechanical thrombectomy. The applicant stated that INDIGO® with Lightning is used for the removal of fresh, soft emboli and thrombi from vessels of the peripheral arterial and venous systems, and for the treatment of pulmonary embolism. The applicant stated that the INDIGO® with Lightning is composed of a mechanical thrombectomy aspiration pump (known as the Penumbra Engine) that is packaged with INDIGO® CAT12 (12 French) and CAT8 (8 French) catheters as well as Lightning, a clot detection/blood loss reduction technology embedded in the Penumbra Engine pump and tubing.

Arterial thromboembolism can result in acute limb ischemia (ALI) which requires emergent treatment. Venous thromboembolism is a condition which includes both deep vein thrombosis (DVT) and pulmonary embolism (PE) and occurs in 1 to 2 individuals per 1000 per year and is predominantly a disease of older age.[284] The 2020 American Society of Hematology guidelines for venous thromboembolism include recommendations for the treatment of patients with both pulmonary embolism and deep vein thrombosis, and recommended treatments include home care, systemic pharmacological thrombolysis, and procedural care.[285]

Procedural care may include open procedures as well as catheter-directed thrombolysis and percutaneous mechanical thrombectomy.[286] In catheter-directed thrombolysis, a thrombolytic agent is infused intravascularly adjacent to the clot burden through a percutaneous transcatheter.[287] In percutaneous mechanical thrombectomy, the thrombus is lysed or removed mechanically. The therapies may be used separately or in conjunction with one another.[288]

The applicant stated that mechanical thrombectomy may be performed with a variety of devices. These methods include aspiration thrombectomy, rheolytic thrombectomy, and fragmentation thrombectomy.[289]

The applicant stated that INDIGO® with Lightning differs from other mechanical thrombectomy devices on the basis of the use of a mechanical pump to generate a vacuum for aspiration and ''intelligent aspiration'' which differentiates clots and patient blood flow, thereby limiting blood loss. The applicant states that other endovascular mechanical thrombectomy devices do not provide aspiration using a vacuum. According to the applicant, the Lightning tubing performs clot detection using a proprietary algorithm. According to the applicant, once this ''smart technology'' detects free-flowing blood, it indicates patent flow to the physician and begins intermittent aspiration resulting in less blood loss during the procedure.

The applicant indicated that there is no unique ICD–10–PCS procedure code to describe the use of INDIGO® with Lightning. The applicant submitted a request for a unique ICD–10–PCS code to identify the technology beginning FY 2022.

INDIGO® with Lightning is a system with multiple components which have been reviewed by FDA both separately and as part of an overall system which includes catheters, tubing, and a vacuum pump. For the catheter portion of the system, INDIGO® aspiration catheter 12 (12 French) and separator 12 received FDA 510(k) clearance on May 28, 2020 for the removal of fresh, soft emboli and thrombi from vessels of the peripheral arterial and venous systems under FDA submission number K192981. The applicant states that they submitted an application for FDA 510(k) clearance for that same technology (with a predicate which received clearance mentioned previously under submission number K192981) for indication of pulmonary embolism under FDA submission number K202821 for which clearance was completed on November 18, 2020. The INDIGO® aspiration catheter 12 and separator 12 received FDA 510(k) clearance for the peripheral arterial and venous system on the basis of similarity to an earlier version of the same catheter and separator, which itself received FDA 510(k) clearance on May 26, 2015 under FDA 510(k) number K142870 as part of the Penumbra Embolectomy System for the same indication. We note that the overall system received a second 510(k) clearance on December 20, 2019 under FDA 510(k) number K192833 for the added indication of PE.

With respect to the newness criterion for the tubing, the Lightning tubing received FDA 510(k) authorization for the removal of fresh, soft emboli and thrombi from vessels of the peripheral arterial and venous systems on March 13, 2020 under FDA 510(k) number K193244. The same tubing received FDA 510(k) authorization for pulmonary embolism on April 22, 2020 under FDA

510(k) number K200771, which was granted based on substantial similarity to the same manufacturer's device. The predicate device for the peripheral arterial and venous system was an earlier version of the tubing without Lighting which itself received FDA 510(k) authorization on May 3, 2018 under FDA 510(k) number K180939.

With respect to the newness criterion for the vacuum pump, the Penumbra Engine Pump and Canister received FDA 510(k) clearance for use in the peripheral arterial and venous systems (PAVS) on March 8, 2018 under FDA 510(k) number K180105. The following table summarizes the FDA approval information listed in this section.

INDIGO® System	Indication	Reference Number	Date of Clearance
INDIGO® - Penumbra Embolectomy Aspiration System	PAVS	K142870	May 26, 2015
INDIGO® - Advanced 110 Aspiration Tubing	PAVS	K180939	May 3, 2018
INDIGO® - INDIGO Aspiration System	PE	K192833	December 20, 2019
INDIGO® - Penumbra ENGINE Pump and Canister	PAVS	K180105	March 8, 2018
INDIGO® - LIGHTNING Aspiration Tubing	PAVS	K193244	March 13, 2020
INDIGO® - LIGHTNING Aspiration Tubing	PE	K200771	April 22, 2020
INDIGO® – Aspiration Catheter 12 and Separator 12	PAVS	K192981	May 28, 2020
INDIGO® – Aspiration Catheter 12 and Separator 12	PE	K202821	November 18, 2020

The applicant has applied for new technology add-on payments for INDIGO® with Lightning when used for the treatment of venous thromboembolism, arterial thromboembolism, and pulmonary thromboembolism.

As discussed previously, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, the applicant stated that INDIGO® with Lightning does not use the same or a similar mechanism of action when compared to an existing technology to achieve a therapeutic outcome. The applicant described differences between INDIGO® with Lightning and existing technologies based on the use of a mechanical pump to generate a vacuum for aspiration and the Lightning tubing, which the applicant stated limits blood loss and indicates clot versus patent flow. For pulmonary embolism and the peripheral system, the applicant identified Inari Flowtriever as an existing technology and noted that any aspiration provided using this system is provided via syringe as opposed to a vacuum pump. For the peripheral system, the applicant also identified Inari Flowtriever as using the same syringe method of aspiration. The applicant also identified two additional aspiration thrombectomy catheters, Angiojet® and Angiovac®, used in the peripheral system and suggested that Angiojet® also uses a syringe for aspiration and that Angiovac® utilizes an extracorporeal bypass circuit that is created outside the body consisting of an outflow line, a centrifugal pump, a filter and an inflow line.

With respect to the second criterion, whether a product is assigned to the same or a different MS–DRG, the applicant stated that services provided using this device would be captured under MS–DRGs 163–165 and 270–272. MS–DRGs 163–165 address major chest procedures and MS–DRGs 270–272 address other major cardiovascular procedures.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population when compared to an existing technology, the applicant did not address this criterion directly in the application, but stated that the new use of the INDIGO® System with Lighting is for the most recent FDA indication (April 2020) in PE. The applicant further states that PE is not the same disease as arterial and venous thromboembolism; the patient populations may overlap, but are not identical.

We have the following concerns regarding whether the technology meets the substantial similarity criteria and whether it should be considered new. While the applicant discussed the differences between INDIGO® with Lighting and products made by other manufacturers, the applicant does not provide enough information regarding how INDIGO® with Lightning differs in its components from the existing aspiration thrombectomy catheters on the market to determine whether the technology uses a unique mechanism of action. We question whether the mechanism of action of the pump is different than that of the existing aspiration thrombectomy systems that also use a pump rather than a syringe, and how the mechanism of action of the separator, which is part of the catheter portion of the device, is different from that of existing thrombectomy systems that deploy a device through the lumen of the catheter to break up the thrombus. It is also unclear what mechanism of action is used within the ''smart technology'' and how it may differ from other products which are intended to similarly reduce blood loss during the procedure. It is unclear if the ''smart technology'' resides within the pump, which was cleared by FDA 510(k) on March 8, 2018, or within the tubing, which was most recently cleared by FDA 510(k) on April 22, 2020. We note that while the applicant did not directly address the third criterion within the application, based on the clinical uses of the device described in the application, we believe the INDIGO® with Lightning is intended for a patient population that is similar to the patient population treated by existing thrombectomy devices, including patients who receive percutaneous interventions for PE and peripheral arterial thromboembolism.

We note that the predicate device for the vacuum pump, the Penumbra Engine Pump and Canister, received FDA 510(k) clearance for use in the peripheral arterial and venous systems on March 8, 2018 under FDA 510(k) number K180105 and therefore appears to no longer be considered new. We further note that the catheter and tubing, as described in the 510(k) applications, appear to only have minor differences from their predicate devices such as length of tubing and shelf life, as opposed to elements that would affect the mechanism of action. If we determine that the catheter and tubing are substantially similar to the predicate

devices cleared under FDA 510(k) numbers K142870 (May 26, 2015) and K180939 (May 3, 2018), respectively, the newness date of the INDIGO® with Lightning would correspond to the dates listed and therefore may no longer be considered new. We also note that it is unclear whether the components of the system may be substantially similar to the overall system and whether the applicable newness date for each indication would therefore be the date of the overall system clearance for each indication, specifically May 26, 2015 for peripheral arterial and venous systems and December 20, 2019 for pulmonary embolism.

We invite public comment on whether INDIGO® with Lightning is substantially similar to other technologies and whether INDIGO® with Lightning meets the newness criterion.

With regard to the cost criterion, the applicant searched the FY 2019 MedPAR claims data file with the FY 2019 Final Rule with Correction Notice IPPS Impact File to identify potential cases representing patients who may be eligible for treatment using the INDIGO® System. The applicant identified claims with any one of the following ICD–10–PCS codes for percutaneous mechanical thrombectomy:

Pulmonary Embolism	
02CP3ZZ	Extirpation of matter from pulmonary trunk, percutaneous approach
02CQ3ZZ	Extirpation of matter from right pulmonary artery, percutaneous approach
02CR3ZZ	Extirpation of matter from left pulmonary artery, percutaneous approach
02CS3ZZ	Extirpation of matter from right pulmonary vein, percutaneous approach
02CT3ZZ	Extirpation of matter from left pulmonary vein, percutaneous approach
Deep Vein Thrombosis/Vascular	
04CC3Z6	Extirpation of matter from right common iliac artery, bifurcation, percutaneous approach
04CC3ZZ	Extirpation of matter from right common iliac artery, percutaneous approach
04CD3Z6	Extirpation of matter from left common iliac artery, bifurcation, percutaneous approach
04CD3ZZ	Extirpation of matter from left common iliac artery, percutaneous approach
04CE3Z6	Extirpation of matter from right internal iliac artery, bifurcation, percutaneous approach
04CE3ZZ	Extirpation of matter from right internal iliac artery, percutaneous approach
04CF3Z6	Extirpation of matter from left internal iliac artery, bifurcation, percutaneous approach
04CF3ZZ	Extirpation of matter from left internal iliac artery, percutaneous approach
04CH3Z6	Extirpation of matter from right external iliac artery, bifurcation, percutaneous approach
04CH3ZZ	Extirpation of matter from right external iliac artery, percutaneous approach
04CJ3Z6	Extirpation of matter from left external iliac artery, bifurcation, percutaneous approach
04CJ3ZZ	Extirpation of matter from left external iliac artery, percutaneous approach
04CK3Z6	Extirpation of matter from right femoral artery, bifurcation, percutaneous approach
04CK3ZZ	Extirpation of matter from right femoral artery, percutaneous approach
04CL3Z6	Extirpation of matter from left femoral artery, bifurcation, percutaneous approach
04CL3ZZ	Extirpation of matter from left femoral artery, percutaneous approach
04CM3Z6	Extirpation of matter from right popliteal artery, bifurcation, percutaneous approach
04CM3ZZ	Extirpation of matter from right popliteal artery, percutaneous approach
04CN3Z6	Extirpation of matter from left popliteal artery, bifurcation, percutaneous approach
04CN3ZZ	Extirpation of matter from left popliteal artery, percutaneous approach
04CP3Z6	Extirpation of matter from right anterior tibial artery, bifurcation, percutaneous approach
04CP3ZZ	Extirpation of matter from right anterior tibial artery, percutaneous approach
04CQ3Z6	Extirpation of matter from left anterior tibial artery, bifurcation, percutaneous approach
04CQ3ZZ	Extirpation of matter from left anterior tibial artery, percutaneous approach
04CR3Z6	Extirpation of matter from right posterior tibial artery, bifurcation, percutaneous approach
04CR3ZZ	Extirpation of matter from right posterior tibial artery, percutaneous approach
04CS3Z6	Extirpation of matter from left posterior tibial artery, bifurcation, percutaneous approach
04CS3ZZ	Extirpation of matter from left posterior tibial artery, percutaneous approach
04CT3Z6	Extirpation of matter from right peroneal artery, bifurcation, percutaneous approach
04CT3ZZ	Extirpation of matter from right peroneal artery, percutaneous approach
04CU3Z6	Extirpation of matter from left peroneal artery, bifurcation, percutaneous approach
04CU3ZZ	Extirpation of matter from left peroneal artery, percutaneous approach
06CC3ZZ	Extirpation of matter from right common iliac vein, percutaneous approach
06CD3ZZ	Extirpation of matter from left common iliac vein, percutaneous approach
06CF3ZZ	Extirpation of matter from right external iliac vein, percutaneous approach
06CG3ZZ	Extirpation of matter from left external iliac vein, percutaneous approach
06CM3ZZ	Extirpation of matter from right femoral vein, percutaneous approach
06CN3ZZ	Extirpation of matter from left femoral vein, percutaneous approach

In its analysis, the applicant identified a primary cohort to assess whether this therapy met the cost criterion. The previously listed ICD–10–PCS procedure codes were used to identify claims involving percutaneous procedures. The claim search conducted by the applicant resulted in 15,580 claims mapping to six MS–DRGs: 270 (Other Major Cardiovascular Procedures with MCC), 271 (Other Major Cardiovascular Procedures with CC), 272 (Other Major Cardiovascular Procedures without CC/MCC), 163 (Major Chest Procedures with MCC), 164 (Major Chest Procedures with CC), and 165 (Major Chest Procedures without CC/MCC).

The applicant determined an average unstandardized case weighted charge per case of $126,211.

The applicant did not remove charges for prior technology. The applicant stated that no prior technology is being replaced. The applicant then standardized the charges using the FY 2019 Final Rule with Correction Notice Impact File. Next, the applicant applied the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges (1.13218). To calculate the charges for the new technology, the applicant used what it stated was the national average CCR for the Supplies and Equipment cost center of 0.299 from the FY 2021 IPPS final rule. However, we note that the actual value for this cost center for FY 2021 was 0.297. The applicant calculated a final inflated average case-weighted standardized charge per case of $180,036, which exceeded the average case-weighted threshold amount of $126,211 by $53,825. The applicant stated that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the therapy meets the cost criterion.

We invite public comment on whether INDIGO® with Lightning meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that the INDIGO® with Lightning represents a substantial clinical improvement over existing technologies because it results in lower rates of aspirated blood loss during the procedure, low major bleeding event rate, reduces blood loss, reduces ICU stays, and reduces procedure time. The applicant also suggested that the technology allows for revascularization without thrombolytics and no recurrence of pulmonary embolism after 30 days.

To support its application, the applicant submitted a reference to the EXTRACT–PE prospective, single-arm study across 22 sites comparing the use of INDIGO® without Lightning to systemic thrombolysis in 119 patients with PE who had not been previously treated with anti-thrombolytics or an adjunctive device within 48 hours. The applicant stated that this study was completed under FDA Investigational Device Exception (IDE) G170064. The applicant claimed that the EXTRACT–PE study showed the INDIGO® without Lightning led to a significant mean reduction of 0.43 in right ventricle/left ventricle (RV/LV) ratio (a measure associated with poor clinical outcomes when greater than 1) that corresponded to a 27.3 percent reduction at 48 hours after intervention. They also cited a low major adverse event composite rate of 1.7 percent within 48 hours, device usage of only 37 minutes and median ICU length of stay of 1 day. According to the applicant, rates of cardiac injury, pulmonary vascular injury, clinical deterioration, major bleeding, and device-related death at 48 hours were 0%, 1.7%, 1.7%, 1.7%, and 0.8%, respectively.

The applicant cited a poster of an unpublished retrospective case review study by Hastings [290] of 18 patients with DVT treated with INDIGO® followed by anticoagulation. Primary technical success (defined as restoration of blood flow with minimal residual thrombus (<10%) without the need for a second session of treatment) was achieved in 15 patients. Three patients required adjunctive methods for successful clearance of thrombus, undergoing two sessions of treatment. Two patients had recurrence of DVT following single-session treatment, both of whom were asymptomatic at time of diagnosis.

The applicant cited the PRISM study,[291] a single-arm, multicenter, retrospective analysis of 79 patients with arterial occlusion from 2018, to provide evidence that use of INDIGO® with Lightning has a low major bleeding event rate, can result in revascularization without thrombolytics, and causes no clinically significant distal embolization. The applicant also stated that the interim results of the INDIAN study, a prospective trial using INDIGO® without Lightning to treat patients with ALI showed no device-related adverse events or major bleeding complications.[292]

The applicant asserted that an unpublished laboratory bench test using water found that the 20.3 mL/sec average flow rate of catheter with Lightning generates 18-fold reduction in blood loss when compared to the use of the same catheter and Penumbra engine pump without the Lightning technology. The applicant asserted that a bench test showed that the Penumbra aspiration pump demonstrates continuous pressure, as evidenced by a sustained -29 inHg (inches of Mercury) through 60 seconds versus a 60-ml syringe which starts at -27 Hg and drops to 0 in Hg within 18 seconds.

The applicant also asserted that an abstract of a single-center retrospective case-control trial of 38 patients by Muck, P., et al. comparing two versions of INDIGO® catheters (12F and 8F) showed that median blood loss was 250mL in the larger Lightning 12F arm (n=9, larger catheter) and 375mL in the 8F arm without Lightning (n=27, smaller catheter). Technical success (defined as greater than 70 percent thrombus reduction) was achieved in 77 percent of patients in the Lightning 12F arm compared to 18.5 percent in the 8F arm without Lightning. The applicant also asserted that this study showed that none (0/9) of the patients in the INDIGO® with Lightning group required post-procedure transfusion, whereas 18.5 percent (5/27) of the INDIGO® without Lightning group required post-procedure transfusion.

We note that in its application, the applicant did not explicitly state what the comparator was for each of its claims in support of substantial clinical improvement; for example, whether INDIGO® is being compared to systemic thrombolysis, percutaneous catheter directed thrombolysis, or other aspiration thrombectomy catheters. Comparing INDIGO® to a medical treatment modality may not be appropriate since percutaneous interventions for PE and DVT have different clinical indications, risks, and benefits compared to medical or surgical interventions.

We also note that the applicant relies mostly on studies of INDIGO® without Lightning to substantiate its claims regarding INDIGO® with Lightning. Of all the studies provided by the applicant, only one small, unpublished study of DVT patients by Muck, P., et al. includes patients treated with INDIGO® with Lightning (which has the intelligent aspiration) versus earlier versions of the applicant's device. The applicant did not demonstrate superior outcomes using INDIGO® with Lightning compared to INDIGO® without Lightning.

We note that outcomes for INDIGO® for the rates of pulmonary vascular injury at 48 hours, clinical deterioration, major bleeding and device-related deaths were stated by the applicant as low compared to systemic thrombolysis, but were not compared to outcomes for existing aspiration thrombectomy devices which may be a more appropriate comparator. We further note that in the poster study, all patients were maintained on anticoagulation following thrombectomy with INDIGO®, so it is difficult to assess the DVT

[290] Hastings, L.H., Perkowski, P.E. Single Session Percutaneous Mechanical Aspiration Thrombectomy for Symptomatic Proximal Deep Vein Thrombosis. Poster.

[291] Saxon, R.R., Benenati, J.F., Teigen, C., Adams, G.K., Sewall, L.E., and Trialists, P. (2018). Utility of a power aspiration-based extraction technique as an initial and secondary approach in the treatment of peripheral arterial thromboembolism: Results of the multicenter prism trial. *J Vasc Interv Radiol.* 29(1): p. 92–100

[292] Donato, et al. Acute Lower Limb Malperfusion—(INDIAN) Registry: Protocol (as presented at VEITHsymposium 2019).

recurrence rate (using INDIGO® alone) to support the claim that INDIGO® can be used with patients with high risk of bleeding.

We also note that suction generated through a vacuum may not be superior to other mechanisms of generating negative pressure used in other existing aspiration catheters. A study comparing suction forces and vacuum pressure of Penumbra pump to a 60-mL syringe and pumps manufactured by several other manufacturers showed that all catheters transmit similar vacuum pressure regardless of pump or 60-mL syringe.[293]

Finally, we question whether there is enough evidence to support that ''intelligent aspiration'' associated with INDIGO with Lightning provides a substantial clinical improvement over existing aspiration catheters from INDIGO® and existing devices where the aspiration is controlled manually. No direct comparison of blood loss between INDIGO® with Lightning catheter and existing aspiration thrombectomy devices from other manufacturers was provided, specifically catheters that reduce blood loss by returning the aspirated blood back to the patient. The unpublished bench test included with the application may have demonstrated a reduction in average volume of water aspirated using the INDIGO® Catheter with Lightning fully functional compared to the INDIGO® catheter with Lightning deactivated (valve pin fixed to the open position). However, this study was not designed to compare blood loss during a thrombectomy procedure between aspiration controlled by a human versus by the Lightning ''intelligent aspiration.''

We invite public comment on whether INDIGO® with Lightning meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for INDIGO® with Lightning or at the New Technology Town Hall meeting.

j. Ischemia Care Respiratory and Stroke Test Kit or ISC–REST

Ischemia Care submitted an application for new technology add-on payment for Ischemia Care Respiratory and Stroke Test Kit (ISC–REST) for FY 2022. Per the applicant, ISC–REST is a test kit composed of three tests to stratify the cause of ischemic strokes by differentiating those that originate in the heart, called cardioembolic (CE) strokes, and those that originate in the arteries, called large artery atherosclerotic (LA) strokes, once it has been determined that a patient has not suffered a hemorrhagic stroke. According to the applicant, ISC–REST is made up of three tests: (1) ISCDx, (2) the QIAstat-Dx Respiratory SARS–CoV–2 Panel, and (3) the QIAGEN Access Anti-SARS–CoV–2 Total Test. According to the applicant, the three test results provide information related to the cause of ischemic stroke and coronavirus disease 2019 (COVID–19) status to prevent a recurrent stroke. Per the applicant, the first of the three tests, ISCDx, is a blood test that uses RNA expression from whole blood to differentiate between CE and LA stroke, two types of ischemic stroke. According to the applicant, once blood is drawn, the RNA expression in the blood sample is analyzed and matched to the gene expression signatures and patterns associated with CE stroke and LA stroke. Per the applicant, the second test, the QIAstat-DX respiratory SARS–CoV–2 Panel, is a multiplexed nucleic acid real-time polymerase chain reaction (PCR) test intended for the qualitative detection and differentiation of nucleic acid from 22 respiratory pathogens, including the SARS–CoV–2 virus, in nasopharyngeal swabs. According to the applicant, the third test is the QIAGEN Access Anti-SARS–CoV–2 Total Test, a rapid, digital lateral flow serological test to detect antibodies to SARS–CoV–2 in human serum and plasma.

According to the applicant, the ISC–REST kit is intended to be used when a patient presents at the hospital with an ischemic stroke, within 30 hours of symptom onset and with a National Institutes of Health Stroke Scale (NIHSS) score of ≥5. The NIHSS measures stroke-related neurologic deficit and has predictive validity for long-term stroke outcome.[294] Per the applicant, the ISC–REST kit is intended for use at the time of the standard evaluation, at the same time that normal blood samples are collected when a patient is admitted to the hospital for stroke. According to the applicant, to use the ISC–REST kit, blood is drawn into a PaxGene tube (for the ISCDx test), a nasal swab is obtained (for the QIAstat-Dx Respiratory SARS–CoV–2 Panel), and an additional blood sample is drawn (for the QIAGEN Access Anti-SARS-CoV–2 Total Test). Per the applicant, the hospital sends all three samples to a single laboratory, the Clinical Laboratory Improvement Amendments (CLIA) certified Ischemia Care laboratory, for processing and reporting. According to the applicant, three results are reported: (1) A result for whether the gene expression in the blood sample was consistent with CE stroke or LA stroke, (2) a result for respiratory screening that includes COVID–19, influenza, and other respiratory illnesses, and (3) a result for COVID–19 antibodies to determine whether the patient previously had COVID–19.

According to the applicant, the number of cryptogenic ischemic strokes, or ischemic strokes where the cause is unknown, is concerning. The applicant states that there are 695,000 ischemic strokes each year in the United States, with 185,000 of these events being recurrent strokes. Per the applicant, for up to 40% of ischemic strokes, or roughly 250,000 ischemic strokes, the cause is cryptogenic.[295] The applicant states that when the cause of stroke is identified, secondary stroke prevention protocols may be adapted to prevent a bigger, more costly, and severe recurrent stroke. The applicant explains that cryptogenic stroke leads to high recurrence risk in cases of undetected atrial fibrillation. The applicant also explains that typically the diagnosis of the causes of stroke is complex, inconsistent across hospitals, expensive, and inconclusive. Further, the applicant claims that the cryptogenic rate is higher for stroke patients with COVID–19 than stroke patients without COVID–19, citing a retrospective study of patients hospitalized at a major New York health system between March and April 2020 that found that the cryptogenic rate was 65% for COVID–19 positive patients.[296] In that study, out of 3,556 patients that were hospitalized and diagnosed with COVID–19 during that time, 32 patients or under 1% of the sample size experienced an ischemic stroke. The study found that the standard stroke diagnostic workup did not establish the ischemic stroke etiology for a significant proportion of patients in the study with concurrent

[296] Shadi Yaghi, et al. SARS–CoV–2 and Stroke in a New York Healthcare System, *Stroke.* 2020; 51:2002–2011. DOI: 10.1161/STROKEAHA.120.030335, available at: *https://www.ahajournals.org/doi/10.1161/STROKEAHA.120.030791.*

COVID–19 infection and ischemic stroke: cryptogenic stroke diagnosis was twice more prevalent in COVID–19-positive patients (65.6%), compared with both COVID–19-negative contemporary stroke patients (30.4%) and ischemic stroke patients hospitalized in the same hospital system during the same time period the year prior (25.0%).

While the applicant states in the application that there is no standard of care pathway to determine the cause of stroke, a stroke patient presenting at the hospital is typically evaluated using a standard evaluation that includes imaging and hematologic testing to determine if the patient is a candidate for intervention. Diagnosing the cause of stroke, per the applicant, often requires expensive testing, risk to the patient, and invasive procedures, without a guarantee of a definitive diagnosis. The applicant explains that each suspected cause requires a focused workup to confirm the suspicion. Additionally, the applicant points out, a negative result in one pathway does not mean a positive result in another pathway. The applicant claims that the inability to accurately stratify patients by cause of stroke often results in either limiting use of advanced patient testing or performing too many tests. The applicant further claims that diagnosing the cause of stroke and preventing recurrent stroke using a standard evaluation is even more challenging for ischemic stroke patients with COVID–19 because these patients are presenting at younger ages and without traditional comorbidities, eliminating many of the traditional causes of stroke.

While the applicant states that it is unclear to clinicians whether COVID–19 is a separate cause of stroke or aggravates comorbidities to cause a stroke, the applicant claims that the information that the ISC–REST kit would provide is important, as clinicians currently know very little about the vascular effects of COVID–19. The applicant states that the ISC–REST kit ties all of the clinical diagnosis pieces together: Respiratory viral and bacterial organism presence, COVID–19 antibody presence, and CE or LA stroke. Per the applicant, this combined testing is convenient for the clinician and also raises awareness about the COVID-stroke connection by providing real world evidence.[297] [298] Additionally, the applicant explains that traditional diagnosis of ischemic stroke cause is often complex, inconsistent, expensive, inconclusive and may require more invasive diagnosis procedures, such as implantable cardiac monitoring or transcranial doppler. Ultimately, according to the applicant, the traditional process to stratify the cause of stroke may require months or years of additional tests post event.

With respect to the newness criterion, each of the three tests in ISC–REST, as well as the ISC–REST test kit as a whole, have varying FDA authorization statuses and separate indications. The applicant stated in their application that they are seeking Emergency Use Authorization (EUA) from the FDA for the ISC–REST test kit. The applicant shared that the intended indication of ISC–REST is to provide three critical diagnostic tests in the same kit for convenience of the user during the COVID–19 public health emergency. For the ISCDx test, the applicant stated that the test had completed the requirements of the Clinical Laboratories Improvement Amendments (CLIA) analytical validations and is available as a Laboratory Developed Test. ISCDx's intended indication is to aid in the diagnosis of CE and LA stroke, when hemorrhagic stroke is ruled out, in conjunction with standard clinical evaluation and in the context of the patient's clinical history and other diagnostic test results. The test could also be used as part of the clinical evaluation and patient risk assessment. The QIAstat-Dx Respiratory SARS–CoV–2 Panel was granted an EUA on March 30, 2020 and is intended for patients suspected of COVID–19 by their healthcare provider for the detection and differentiation of nucleic acid from SARS–CoV–2 and the following organism types and subtypes: Adenovirus, Coronavirus 229E, Coronavirus HKU1, Coronavirus NL63, Coronavirus OC43, SARS–CoV–2, Human Metapneumovirus A+B, Influenza A, Influenza A H1, Influenza A H3, Influenza A H1N1/pdm09, Influenza B, Parainfluenza virus 1, Parainfluenza virus 2, Parainfluenza virus 3, Parainfluenza virus 4, Rhinovirus/Enterovirus, Respiratory Syncytial Virus A+B, Bordetella pertussis, Chlamydophila pneumoniae, and Mycoplasma pneumoniae. The applicant states that results are for the identification of SARS–CoV–2 RNA, however, negative results do not preclude SARS–CoV–2 infection and should not be used as the sole basis for patient management decisions. According to the applicant, there is no EUA request pending approval for the QIAGEN Access Anti-SARS–CoV–2 Total Test.

The applicant stated that there are currently no ICD–10–PCS procedure codes that uniquely identify the use of ISC–REST. The applicant submitted a request for approval of a unique ICD–10–PCS procedure code to identify use of the technology beginning FY 2022. The applicant provided 81 ICD–10–PCS codes that they stated could be used to identify cases involving the use of ISC–REST in the interim. These 81 ICD–10–CM diagnosis codes are associated with cerebral infarctions, occlusions, and other neurological conditions consistent with ischemic stroke presentations.

As previously discussed, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, according to the applicant, there are no blood tests for stroke or its causes. The applicant also stated that there is no blood testing for the cause of stroke combined with COVID–19 screening.

With respect to the second criterion, whether a product is assigned to the same or a different MS–DRG when compared to an existing technology, the applicant stated that the ISC–REST kit is not replacing an existing technology and reiterated that ISCDx is a blood test that stratifies ischemic stroke patients into CE and LA stroke causes The applicant stated that the technology would map to MS–DRGs 061,062, 063, 064, 065, 066, 067, 068 and that it is not requesting for ISC–REST to map to a new or different MS–DRG for FY 2022.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant stated that there are no existing technologies to stratify stroke populations by cause.

We note the following concerns regarding whether the applicant meets the newness criterion. Under the regulations at 42 CFR 412.87(e)(2), CMS only considers, for add-on payments for a particular fiscal year, an application for which the new technology has received FDA marketing authorization by July 1 prior to the particular fiscal year. While the applicant stated that ISCDx, one of the three tests in ISC–REST test kit, has completed the requirements of the Clinical Laboratories Improvement

[297] Patients with Coronavirus Disease 2019 (COVID–19) vs Patients With Influenza, JAMA Neurol. 2020;77(11):1366–1372.

[298] COVID–19 Is an Independent Risk Factor for Acute Ischemic Stroke, American Journal of Neuroradiology, August 2020, 41(8):1361–1364.

Amendments, we note that this is not considered FDA marketing authorization as required in our regulations for the new technology add-on payment.[299]

In the FY 2009 IPPS final rule (73 FR 48561 through 48563), we revised our regulations at § 412.87 to codify our longstanding practice of how CMS evaluates the eligibility criteria for new medical service or technology add-on payment applications. We stated that new technologies that have not received FDA approval do not meet the newness criterion. In addition, we stated we do not believe it is appropriate for CMS to determine whether a medical service or technology represents a substantial clinical improvement over existing technologies before the FDA makes a determination as to whether the medical service or technology is safe and effective. For these reasons, we first determine whether a new technology meets the newness criterion, and only if so, do we make a determination as to whether the technology meets the cost threshold and represents a substantial clinical improvement over existing medical services or technologies. We also finalized at 42 CFR 412.87(c) (subsequently redesignated as 412.87(e)) that all applicants for new technology add-on payments must have FDA approval or clearance by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered.

In the FY 2021 IPPS/LTCH PPS final rule, to more precisely describe the various types of FDA approvals, clearances, licensures, and classifications that we consider under our new technology add-on payment policy, we finalized a technical clarification to § 412.87(e)(2) to indicate that new technologies must receive FDA marketing authorization (for example, pre-market approval (PMA); 510(k) clearance; the granting of a De Novo classification request; approval of a New Drug Application (NDA); or Biologics License Application (BLA) licensure) by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. As noted in the FY 2021 IPPS/LTCH PPS final rule, this technical clarification did not change our longstanding policy for evaluating whether a technology is eligible for new technology add-on payment for a given fiscal year, and we continue to consider FDA marketing authorization as representing that a product has received FDA approval or clearance for purposes of eligibility for the new technology add-on payment under § 412.87(e)(2) (85 FR 58742).

As previously summarized, the applicant is seeking an EUA from the FDA for the ISC–REST test kit. An EUA by the FDA allows a product to be used for emergency use, but under our longstanding policy, we believe it would not be considered an FDA marketing authorization for the purpose of new technology add-on payments, as a product that is available only through an EUA is not considered to have an FDA approval or clearance. Therefore, under the current regulations at 42 CFR 412.87(e)(2) and consistent with our longstanding policy of not considering eligibility for new technology add-on payments prior to a product receiving FDA approval or clearance, we believe a product available only through an EUA would not be eligible for new technology add-on payments.

We also refer the reader to our comment solicitation in section II.F.7 of the preamble of this proposed rule regarding how data reflecting the costs of a product with an EUA, which may become available upon authorization of the product for emergency use (but prior to FDA approval or clearance), should be considered for purposes of the 2-year to 3-year period of newness for new technology add-on payments for a product with or expected to receive an EUA, including whether the newness period should begin with the date of the EUA.

Additionally, we are uncertain whether the mechanism of action of ISC–REST can be considered new. While the applicant claims that there is currently no other blood test available that identifies the cause of ischemic stroke through RNA biomarkers, we note that clinicians may order blood tests as part of the stroke consultation to gather information about stroke risk factors and other medical problems which may have caused the stroke.[300] In addition, we note that there are several types of RNA biomarker tests for stroke that have been developed and used in other settings, and we therefore note that this may not represent a new mechanism of action for ISC–REST. Similarly, we are not certain whether the QIAstat-Dx Respiratory SARS–CoV–2 Panel and QIAGEN Access Anti-SARS–CoV–2 Total Test components of ISC–REST have unique mechanisms of action, as they may be similar to other PCR nasal swabs and serology tests for COVID–19 that are currently in use during the COVID–19 public health emergency. We welcome public comment regarding whether ISC–REST has a unique mechanism of action even if some or all of its test components do not have unique mechanisms of action individually. Because ISC–REST delivers three separate test results through three separate tests, it is unclear whether the combination of the tests in one kit could be viewed as representing a unique mechanism of action over and above the mechanisms of action of the tests if they were to be performed separately.

With regard to whether the technology maps to the same or different MS–DRG as existing technologies, though the applicant did not state whether it believes the technology meets this criterion, we believe that under the proposed indication for ISCDx, ISC–REST would not be used until a patient had a confirmed ischemic stroke. Therefore, under the proposed indication, it seems that the technology would map to the same MS–DRGs as cases involving the standard of care for ischemic stroke and cerebral infarction. However, it appears that there may be scenarios where a patient has an occlusion or some other neurological condition that makes the patient present with stroke-like symptoms, without having had a stroke or infarction. We invite comments on whether, for this reason, cases involving the use of the technology may be assigned to the same or different MS–DRGs as cases not only involving the standard of care for ischemic stroke and cerebral infarction, but also nonspecific cerebrovascular accidents and pre-cerebral occlusions.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, we note the applicant's statement that there are no existing technologies to stratify stroke populations by cause does not address whether the technology meets this criterion. CMS requests comments on whether ISC–REST kit would be used as a diagnostic aid in the treatment of similar diseases and patient populations as the current standard-of-care ischemic stroke diagnosis evaluation.

We are inviting public comments on whether ISC–REST is substantially similar to other currently available therapies and/or technologies and whether this technology meets the newness criterion.

With regard to the cost criterion, the applicant provided the following analysis. The applicant used claims data from one hospital system, made up of

[299] 42 CFR 412.87(e)(2).

[300] Mayo Clinic Staff, Stroke Diagnosis, Feb. 9, 2021, *https://www.mayoclinic.org/diseases-conditions/stroke/diagnosis-treatment/drc-20350119*.

three hospitals with a total of 87 health care providers. The average percentage of patients across the three hospitals with Medicare or Medicare Advantage coverage was 69%, per the applicant. The applicant stated that raw data was provided from January 2020 through September 2020, then annualized for 2020. Per the applicant, the average standardized charges were calculated per MS–DRG by the hospital system that provided the data.

As mentioned previously, the applicant stated that the technology would map to the following MS–DRGs: MS–DRG 061 (Ischemic Stroke, Precerebral Occlusion or Transient Ischemia with Thrombolytic Agent with MCC), 062 (Ischemic Stroke, Precerebral Occlusion or Transient Ischemia with Thrombolytic Agent with CC), 063 (Ischemic Stroke, Precerebral Occlusion or Transient Ischemia with Thrombolytic Agent without CC/MCC), 064 (Intracranial Hemorrhage Or Cerebral Infarction with MCC), 065 (Intracranial Hemorrhage or Cerebral Infarction with CC or TPA in 24 Hours), 066 (Intracranial Hemorrhage or Cerebral Infarction without CC/MCC), 067 (Nonspecific CVA And Precerebral Occlusion without Infarction with MCC), and 068 (Nonspecific CVA And Precerebral Occlusion Without Infarction Without MCC). The applicant's data included a total of 385 cases mapping to those MS–DRGs. The applicant did not submit claims data for two of the listed MS–DRGs, MS–DRG 063 and 067, because the data source that the applicant used did not have any cases under those MS–DRGs for the time period that the sample data was collected. The applicant imputed 11 claims for two other MS–DRGs, 061 and 068, because there were fewer than 11 claims submitted for these MS–DRGs.

The applicant stated that it compared the distribution of MS–DRGs in the hospital data to the distribution of MS–DRGs in the FY 2022 New Technology Add-On Payment thresholds, which includes the number of cases per MS–DRG. The applicant asserted that because the MS–DRG distributions were highly similar, the data sample obtained from the hospital system was representative of the distribution of MS–DRGs nationally.

The applicant did not remove charges for a prior technology because, as the applicant noted, ISC–REST is not replacing any other technology. The applicant then applied the one-year charge inflation factor of 1.06353 included in the FY 2021 IPPS/LTCH PPS proposed rule (85 FR 59039) to inflate the charges from FY 2020 to FY 2021. To add charges for the new technology, the applicant multiplied the cost of ISC–REST by the cost-to-charge ratio for acute care hospitals found in the FY 2020 IPPS/LTCH PPS final rule. The applicant explained that the urban and rural hospital cost-to-charge ratios were combined to yield a national average of 0.3095. However, we note that the applicant appears to have used the cost-to-charge ratios in Table 8A, which lists the statewide average operating cost-to-charge ratios for acute care hospitals.

The applicant calculated a final inflated average case-weighted standardized charge per case of $87,842 which exceeds the average case-weighted threshold amount, $57,110. The applicant contended that ISC–REST meets the cost criterion based on these analyses.

We have the following concerns regarding the cost criterion. It is not clear whether the applicant's use of private data from three hospitals is representative of the Medicare population. While the applicant states that the average Medicare and Medicare Advantage percentage of patients across the 3 hospitals was 69%, CMS is unsure whether the claims under the MS–DRGs the applicant provided are for Medicare patients, or private insurance patients in those hospitals. Similarly, because the applicant annualized data from the months of January to September 2020, it is not clear whether the portion of time selected by the applicant is representative of the entire year. Additionally, while the applicant points to the fact that the sample of claims data from the 3 hospitals had similar MS–DRG distributions as the FY 2022 New Technology Add-on Payment Thresholds, it is not clear whether this would indicate that the charging practices of the hospitals or their patient costs are similar to Medicare claims data nationally. It is also not clear whether the applicant's cost analysis is representative of the cost of the technology as the applicant did not use the applicable cost-to-charge ratio of 0.107 for laboratory services as provided in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58601). Finally, we note that it is not possible for CMS to verify the claims data submitted, as the applicant used hospital claims data that is not publicly available and did not identify the source. We are inviting public comments on whether ISC–REST meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that ISC–REST represents a substantial clinical improvement over existing technologies for several reasons. First, the applicant asserts that ISC–REST has the ability to stratify ischemic stroke patients early in the diagnosis process to reduce the number of cryptogenic stroke diagnoses, which leads to appropriate medical management that can better reduce the risk of a recurrent stroke. Second, the applicant asserts that ISC–REST will lead to appropriate utilization of subsequent diagnostic testing, or decrease the necessary use of subsequent diagnostic testing, to determine stroke etiology, including: Implantable cardiac monitoring, hypercoagulation panels, magnetic resonance angiography, and other commonly used tests for ischemic stroke. Third, the applicant asserts that use of ISC–REST will lead to a reduction in at least one clinically significant adverse event, a recurrent stroke, including a reduction in mortality or a clinically significant complication. Fourth, the applicant further asserts that use of ISC–REST will result in a decreased use of, or more appropriate utilization of, therapeutic intervention, in cases where patients are medically managed for a comorbidity and a stroke occurs. Fifth, the applicant asserts that use of ISC–REST will result in a decreased number of future hospitalizations by reducing recurrent stroke risk and physician visits, as in some cases ISC–REST will result in a diagnosis pathway that will not require surgical or invasive procedures. Additionally, once ISC–REST identifies the cause of the stroke, the applicant asserts that the opportunity to manage a chronic population may include telemedicine approach, rather than in-person physician visits. Finally, the applicant asserts that ISC–REST will result in improved quality of life by helping avoid a recurrent stroke.

The applicant submitted five information sources to address the substantial clinical improvement criterion, as well as supplementary information in the application itself and additional narrative responses. First, the applicant submitted a poster presentation by Jauch E.C., on the results and methodology of a Biomarkers of Acute Stroke Etiology (BASE) study to determine whether RNA expression can accurately differentiate LA stroke from CE stroke in the acute setting.[301] Similarly, the applicant submitted an unpublished manuscript detailing another BASE study on stroke biomarkers to determine

[301] Jauch, Edward C., on behalf of BASE clinical trial principal investigators, ''RNA Expression for Diagnosis of Stroke Etiology Differentiating Large Artery and Cardioembolic Stroke: Analytical Validation of Testing From the BASE Clinical Trial,'' 2020 AHA International Stroke Conference.

if the etiology of acute ischemic stroke could be objectively determined by RNA expression using BASE blood samples.[302] Third, the applicant submitted a published study methodology paper by Jauch et al., on the methodology of an ongoing (at the time of publication) BASE study to identify serum markers defining the etiology of acute ischemic stroke.[303] The fourth information source, by Jickling et al., was a published article from 2010 on a study to design genetic probes for ischemic stroke. The fifth and final information source submitted was a 2016 journal article by Jeffrey L. Saver, with background information on etiologies of stroke.[304]

The first three information sources all describe the BASE trial (NCT02014896), a prospective, multicenter, observational, convenience, sample cohort study of patients presenting to the hospital within 24 hours of stroke onset, which looked to determine if the etiology of acute ischemic stroke can be objectively determined by RNA expression from patient blood samples.[305] [306] [307] The primary objective of the BASE study was to confirm the diagnostic accuracy of the ISCDx test to identify stroke subtypes in patients with acute ischemic stroke. According to the BASE Study Methodology paper by Jauch et al., while enrollment for this multisite study was ongoing at the time of publication, it was expected to hit 1000 patients by March 2017.[308] The Base Study Methodology paper explains that blood samples were first collected from patients presenting to the hospital within 24 hours of stroke onset, and then again collected 24 hours and 48 hours later.[309] The tubes were kept at room temperature for up to 24 hours and then frozen −20 °C until shipped to the Ischemia Care CLIA laboratory where the ISCDx testing was performed. From these blood samples, RNA gene expression was utilized to identify stroke etiology marker candidates. Patients who met the inclusion criteria: (1) Had experienced a suspected acute ischemic stroke within 24(+/−6) hours of symptom onset; (2) had a normal baseline CT, without hemorrhage or alternate explanation for symptoms; (3) were older than 18 years old; and (4) gave informed consent. Control samples consisted of 100 non-stroke Emergency Department patients matched on clinical risk factors of age, race, gender, smoking history, diabetes, hypertension, atrial fibrillation, and hyperlipidemia. We note that there are changes from the previously stated study methodology in the two sources the applicant included with BASE study results.[310] [311] For example, while the study methodology as described in the Jauch et al. paper stated that the blood samples were kept at room temperature for up to 24 hours and then frozen,[312] in the poster presentation by Jauch, E.C., the samples were frozen within 72 hours of collection.[313]

The applicant describes a set of study results, which are detailed in the unpublished manuscript by Peacock et al. and the poster presentation by Jauch, E.C.[314] [315] These analyses used adjudicated stroke diagnoses, classified as CE and LA, and determined by two board-certified neurologists blinded to each other's diagnosis and biomarker results. The 218 patients enrolled were randomly assigned to a derivation cohort (70%) or validation cohort (30%). Using the derivation set gene expression levels, a signature was created to distinguish between CE and LA ischemic stroke, with the derived model then applied to the validation cohort. 59% of the participants in the study were male with a median age of 70.7 years. The median time from symptom onset to blood collection was 1200 minutes (ranging from 448 to 1568 minutes). The applicant explains that, of the 218 patients enrolled with an NIHSS>5, 149 were adjudicated as CE and 69 were adjudicated as LA. Additionally, sample analysis of the derivation cohort resulted in 9,513 unique gene-level probe-sets for signature inclusion, with the best set containing 45 genes. The diagnostic gene signature results in the early validation cohort distinguished CE stroke from LA stroke with a C-statistic of 0.78 (0.50–1.0, 95% CI), sensitivity of 0.90 and specificity of 0.70. The study concluded that RNA expression accurately identifies stroke etiology.

The applicant also provided the following supplemental information to support that combining three tests in the ISC–REST kit improves patient outcomes over performing the lab tests separately. Though the applicant noted that there is no direct evidence currently available regarding the impact of using the ISC–REST kit, they explain that, in their experience, clinical supporters of the ISC–REST kit claim that they would order ISC–REST kit testing 100% of the time versus ordering three separate tests. The applicant claims that there is a convenience, cost effectiveness, and time savings associated with ISC–REST during a time when hospital resources are limited. Second, the applicant states that because the QIAstat-Dx Respiratory SARS–CoV–2 Panel tests for COVID–19 as well as 12 other common respiratory illnesses, in testing for several respiratory illnesses, ISC–REST may inform care decisions. Third, the applicant states that collecting the samples for each test together and testing them in the same laboratory will ensure high levels of quality control. The applicant also claims that using the ISC–REST test kit has investigative benefits, including the ability to help track and study how long the COVID–19 antibodies last in a chronic population based upon consistent measurement of the index events (stroke and COVID–19). Finally, the applicant states that the ISC–REST kit and adoption of guideline-directed appropriate care will result in prevention of recurrent strokes because it will impact clinician choice of therapeutics.

After a review of the information provided by the applicant, we have the

following concerns with regard to the substantial clinical improvement criterion.

We note that all of the BASE study results that the applicant submitted provide information on the ISCDx test on its own rather than the ISC–REST test kit, for which the applicant has submitted an application for new technology add-on payment consideration.[316] [317] As stated in the BASE Study methodology paper by Jauch, et al., the primary objective of the BASE study is to confirm the diagnostic accuracy of the ISCDx test to identify stroke subtypes in patients with acute ischemic stroke.[318] No data were provided with regard to the complete ISC–REST kit, the other components individually, or any combination. We are therefore unclear as to whether it is possible to draw conclusions about substantial clinical improvement for the ISC–REST kit using the limited data provided on the ISCDx test and without any data or studies on the ISC–REST kit. Specifically, the applicant did not submit data or studies on how treatment decisions are impacted after the ISC–REST kit is used or if there is any impact on patient outcomes as a result of using the technology. While the applicant has made claims regarding reducing downstream diagnostic tests and avoiding inappropriate medical intervention by using the ISC–REST kit, it did not provide any studies or data regarding these claims. The applicant also made claims as to how the individual parts of the test impact care decisions, but similarly did not provide data to demonstrate this. For example, the applicant claimed that, in testing for several respiratory illnesses, the QIAstat-Dx Respiratory SARS–CoV–2 Panel will inform care decisions, but did not submit any evidence that this is the case. We also note that, because the applicant has not submitted evidence to demonstrate the utility of the ISC–REST kit, it seems that the additional tests outside of the ISCDx test could result in clinical burden and additional cost without demonstrated benefits.

With regard to the studies submitted on ISCDx, we are unsure whether they demonstrate or examine the impacts of using the test on patient care and clinical outcomes. The applicant did not submit evidence to demonstrate that a recurrent stroke did not happen, that the use of more invasive investigational or further diagnostic tools was avoided, or that there was an increase in appropriate treatment and recurrent stroke prevention protocols after using the test. In the study methodology paper by Jauch et al., the applicant did not include full survey results because they were not available at the time the application was submitted. Additionally, we are unsure how to interpret the results from the small BASE study for ISCDx because there are variations between the study methodology as explained in the Jauch, E.C. et al. paper and the way the studies were actually conducted. For example, while the study methodology as described in the Jauch et al., paper stated that the blood samples were kept at room temperature for up to 24 hours and then frozen,[319] in the poster presentation by Jauch, E.C., the samples were frozen within 72 hours of collection.[320] We also have concerns regarding the testing accuracy of the ISCDx test. In the BASE study results that were submitted on the ISCDx test, the sensitivity was 0.90 and specificity was 0.70 for a sample size of 218 survey subjects.[321] Due to these figures, we question whether ISC–REST would alter the standard care ischemic stroke patients receive. Further, we note that the only trials submitted on the ISCDx test included patients whose cause of stroke was already determined. While the applicant claims that ISC–REST has the ability to stratify ischemic stroke patients early in the diagnosis process to reduce the number of cryptogenic stroke diagnoses and more appropriately manage stroke to reduce secondary recurrence, we question if there is sufficient evidence to evaluate this claim because the cause of stroke had already been determined in the study results the applicant submitted.

The applicant stated that there is no guideline standard of care pathway to determine cause of stroke, and uses this assertion as an underlying assumption for its claims in support of substantial clinical improvement. CMS notes that while there is room for clinicians to order certain additional tests over others depending on a patient's circumstances, there are algorithms developed by professional societies for the diagnosis and treatment of ischemic stroke.[322] These best practices are updated frequently to reflect current clinical research, and detail prehospital care, urgent and emergency evaluation and treatment, and in-hospital management, including early secondary prevention measures. CMS notes that by assuming that there is no guideline standard of care to determine the cause of stroke, the applicant has not presented information to compare the technology against a standard of care or other technology to allow for an assessment of whether the technology is a substantial clinical improvement over existing technologies to diagnose the cause of stroke.

We are also unsure whether the way the ISC–REST test kit is used will limit its ability to impact any care decisions and prevent hospital use. Specifically, we question if the extended 30-hour window for obtaining the patient samples, as well as the added element of shipping the ISC–REST kit to a single laboratory, is in line with stroke protocols, which focus on diagnosing a stroke as quickly as possible to maximize patient outcomes. There has been extensive research regarding the time-outcome relationship for stroke; because brain cells die rapidly after the event of the stroke, effective treatment must start as early as possible.[323] Since every minute matters in stroke treatment and secondary prevention, we believe that clinicians may order further diagnostic tests and begin a treatment plan before the ISC–REST kit results become available, which may limit the utility of the technology and its ability to impact care decisions. In other words, CMS questions whether ISC–REST would improve or alter the standard course of treatment for ischemic stroke due to the delay in receiving test results. We further note that sending the ISC–REST test kit to an external lab may cause a delay in COVID–19 test results as well. Therefore, we remain unclear as to the clinical benefit of combining these tests and are unsure how this potential for delay in results affects the technology's ability to impact care decisions.

The applicant also submitted various narrative responses claiming that testing for COVID–19 at the same time as testing for the cause of the ischemic stroke constitutes substantial clinical improvement over existing technologies. Regarding the applicant's claims that the ISC–REST test kit is convenient for clinicians, CMS is unsure whether there is currently a need to order testing for COVID–19 along with the ISCDx test because, during the COVID–19 public health emergency, many hospitals automatically test for COVID–19 upon hospital admission to ensure proper treatment and containment. Further, CMS is unsure whether convenience for clinicians is evidence of substantial clinical improvement. With regard to the applicant's claim that, in its experience, clinical supporters of the ISC–REST kit claim that they would order ISC–REST kit testing 100% of the time versus ordering three separate tests, it is unclear whether clinical supporters of the ISC–REST kit are representative of all providers, including those participating in Medicare. Similarly, the applicant did not provide evidence to support its claim that ISC–REST will help gather data on any connection between COVID–19 and stroke, including a tracking mechanism for how long COVID–19 antibodies last, such as how ISC–REST would be better at gathering data on COVID–19 and stroke than other COVID–19 diagnostics.

Regarding the applicant's claims that knowing the results of all three tests in the ISC–REST kit, including COVID–19 status, impacts clinicians' choice of therapeutics for secondary stroke prevention or other treatment decisions, we are not sure that this conclusion can be reached as the connection between COVID–19 and stroke has not been established. As evidence of the connection between COVID–19 and stroke, the applicant claims that the cryptogenic rate is higher for stroke patients with COVID–19 than stroke patients without COVID–19 and references a study of one hospital, where 32 patients hospitalized for COVID–19 or positive for COVID–19 experienced an ischemic stroke during a one-month period of time in the spring of 2020. Other studies have been conducted researching the possible link between COVID–19 and stroke, including one study with a larger sample size, analyzing over 27,000 participants across 54 health care facilities, that suggests that stroke in COVID–19 patients is infrequent, and is associated with typical stroke risk factors.[324] Another study, analyzing data from close to 25,000 discharges from a large New York-based health care system from January to April 2020, did not identify a positive association between ischemic stroke and COVID–19.[325] Based on the information that the applicant submitted, it is also unclear whether stroke treatment for an ischemic stroke patient, who is also COVID–19 positive, would be different than for an ischemic stroke patient who is COVID–19 negative. For example, it is unclear whether a stroke patient would not receive antiplatelet or anticoagulative treatment due to a COVID–19 diagnosis. Because the connection between stroke and COVID–19 is unclear and is still in the preliminary stages of research, we are unsure whether testing for the type of ischemic stroke as well as COVID–19 status is a substantial clinical improvement over existing technologies. As stated previously, the applicant did not submit studies or data on how using the ISC–REST kit has an impact on downstream treatment decisions or patient outcomes to determine whether knowing a patient's COVID–19 status and the type of ischemic stroke they experienced is a substantial clinical improvement over existing technologies. Furthermore, as there is research that casts doubt on the connection between COVID–19 and stroke,[326] [327] we question whether placing an emphasis on COVID–19 status and stroke may discourage a clinician from continuing to investigate the cause or treat an underlying predisposing condition for stroke, once the patient has recovered from COVID–19, and whether this could potentially lead to negative patient outcomes.

We are inviting public comments on whether ISC–REST meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for ISC–REST.

j. Lifileucel

Iovance Biotherapeutics submitted an application for new technology add-on payments for lifileucel for FY 2022. According to the applicant, lifileucel is a proprietary, one-time autologous Tumor Infiltrating Lymphocytes (TIL) cell-based therapy being studied for effectiveness in solid tumors. TIL cell therapy with lifileucel involves the adoptive cell transfer (ACT) of autologous T-cells directly isolated from the tumor tissue and expanded ex vivo without any prior selection or genetic modification. Tumor antigen-specific T-cells are located within tumor lesions, where a dysfunctional state and low numbers prevent them from effectively eradicating the tumor. By isolating autologous TIL from the tumor microenvironment and expanding them, the lifileucel manufacturing process produces large numbers of reinvigorated T-cells. Following the infusion of lifileucel, the TIL migrate back into the tumor, including metastases, where they trigger specific tumor cell killing upon recognition of tumor antigens.

According to the applicant, relapsed and refractory metastatic melanoma presents a high unmet medical need with low survival rates and limited durable treatment options.[328] Despite the advances in available treatments, responses in patients with metastatic melanoma are at times inadequate, with many patients either not responding (40% to 65%) [329] [330] or displaying primary or acquired resistance (>70%) and the disease progresses.[331] [332] [333] [334] [335] The applicant

[333] Gide TN, et al. Primary and acquired resistance to immune checkpoint inhibitors in

stated there are currently no approved agents for the treatment of patients with metastatic melanoma who fail available standard-of-care therapies, which include immune checkpoint inhibitors (ICI) and BRAF/MEK inhibitors. According to the applicant, the only commonly used available therapy for these patients post progression is chemotherapy. The applicant stated that as demonstrated in the literature referenced previously, retreatment with chemotherapy [336] [337] [338] or experimental combined ICIs [339] offers a poor Objective Response Rate (ORR) [340] of 4%–10%,[341] [342] a median PFS of 2.7–3.7 months [343] [344] [345] and a median OS of ~7–8 months.[346] [347]

With respect to the newness criterion, the applicant stated that they are currently awaiting FDA approval of the Biologics License Application (BLA) for lifileucel as an autologous TIL immunotherapy indicated for the treatment of patients with unresectable or metastatic melanoma who have been previously treated with at least one systemic therapy, including a PD–1 blocking antibody and, if BRAF V600 mutation positive, a BRAF inhibitor or BRAF inhibitor with MEK inhibitor. The applicant stated that currently, there are no ICD–10–PCS procedure codes to uniquely identify procedures involving lifileucel. We note that the applicant has submitted a request for approval for a unique ICD–10–PCS code for the administration of lifileucel beginning in FY 2022.

If a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, the applicant asserted that lifileucel is not the same or similar to the mechanism of action of currently available products used in the treatment of advanced melanoma. According to the applicant, prior to 2011, the most common first-line treatment for patients with Stage III unresectable or Stage IV unresectable metastatic melanoma was single-agent therapy using dacarbazine (DTIC) or another alkylating agent, or combination chemotherapy using DTIC together with a platinum-based drug such as carboplatin and/or a microtubule inhibitor such as paclitaxel.[348] [349] [350] IL–2 therapy has also been used as part of a biochemotherapy (BCT) antineoplastic regimen. The applicant asserted that since 2011, treatment options for advanced-stage melanoma have included kinase inhibitors such as BRAF and MEK inhibitors, cytotoxic T-lymphocyte-associated antigen 4 (CTLA–4) and programmed cell-death protein 1 (PD–1) blocking antibodies. According to the applicant, the currently available first and second line treatments for advanced melanoma include kinase inhibitors (BRAF and MEK inhibitors) and ICIs (anti-CTLA–4 antibody and anti-PD1 antibody).[351] The applicant asserts that there are no approved treatment options for patients with metastatic melanoma that have progressed after two lines of therapy.

According to the applicant, TIL cell therapy with lifileucel uses a novel and distinct mechanism of action which delivers a highly customized, personalized, and targeted treatment for unresectable or metastatic melanoma. Lifileucel TIL cell therapy involves the ACT of autologous T-cells directly isolated from the patient's tumor tissue and expanded ex vivo. Following the infusion of lifileucel, the TIL migrates back into the patient's tumor deposits, including metastases, where they trigger specific tumor cell killing upon recognition of tumor antigens. According to the applicant, after approval, lifileucel will be the only personalized, cellular therapy indicated for the treatment of unresectable or metastatic melanoma.

The applicant asserted TIL cell therapy with lifileucel is also highly differentiated from currently approved chimeric antigen receptor (CAR) T-cell therapies which treat liquid tumors: YESCARTA® (axicabtagene ciloleucel) and KYMRIAH® (tisagenlecleucel), both approved for the treatment of large B-cell lymphoma in adults, and recently approved TECARTUS™ (brexucabtagene autoleucel) indicated for the treatment of relapsed/refractory mantle cell lymphoma (MCL). According to the applicant, CAR T-cell therapies mainly target only single/surface tumor antigens, versus TIL cell therapy which targets multiple tumor antigens. The applicant stated that there are no examples of successful utility of CAR T-cell therapy in solid tumors. The applicant further stated that the TIL mechanism of action does not rely on genetically engineered receptors, but maintains some physiologic control and therefore avoids hyperactivation that may be responsible for complications from CAR T-cell therapy such as cytokine release syndrome (CRS) or neurotoxicity.[352] Per the applicant,

[352] Fardis M, et al. Current and future directions for tumor infiltrating lymphocyte therapy for the

Continued

there have been no off-tissue effects found to date following treatment with TIL cell therapy, and TIL therefore offers a differentiated safety profile compared to CAR T-cell products or ICIs and confirms the mechanism of action differentiation discussed previously.

With respect to the second criterion, whether a product is assigned to the same or different MS–DRG, the applicant stated that CMS has not yet determined the MS–DRG mapping for cellular therapies such as lifileucel. The applicant asserted that while TIL cell therapy is different from CAR T-cell therapy mechanistically, from tumor (solid vs. liquid) activity, and from a safety perspective, there are other similarities that support grouping the two technologies into a common MS–DRG for autologous T-cell immunotherapy. The applicant asserted that both CAR T-cell and TIL require collection of a patient's lymphocyte cells which are the core component of a complicated and lengthy manufacturing process to produce a patient-specific therapeutic dose. The applicant added that both are primarily administered in a hospital inpatient setting because of the risk of significant but treatable adverse events. Lastly, the applicant stated because of the complex process required to develop a personalized treatment and the total cost of caring for patients who have received TIL cell therapy that is similar to CAR T-cell therapy, these cases are expected to be comparably resource intensive.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant stated that with FDA approval, lifileucel will be the only FDA-approved cellular treatment for patients with unresectable or metastatic melanoma who have been previously treated with at least one systemic therapy.

Based on the information provided by the applicant, we have several questions with regard to the newness criterion. With respect to the first criterion for substantial similarity, we note that for FY 2019 (83 FR 41299), CMS approved two CD19 directed CAR T-cell therapies, YESCARTA® and KYMRIAH®, for new technology add-on payments. The applicant asserted that CAR T-cell therapies and TIL therapies can be differentiated by multiple criteria as listed previously. We are seeking public comment on whether the mechanism of action for lifileucel is different from existing therapies, in particular whether the distinguishing criteria identified by the applicant are sufficient to differentiate the mechanism of action of TIL from CAR T-cell therapies.

We are inviting public comments on whether lifileucel is substantially similar to other currently available therapies and/or technologies and whether this technology meets the newness criterion.

With regard to the cost criterion, the applicant provided the following analysis to demonstrate the technology meets the cost criterion. The applicant conducted multiple analyses to include a primary cohort, a cohort with a principle or admitting ICD–10 diagnosis of melanoma and metastasis and a cohort with any ICD–10 diagnosis of melanoma and metastasis. The ICD–10 codes and MS–DRGs identified by the applicant (for the primary cohort) are listed in the following tables.

MS-DRG Assignments for Primary Cohort	
MS-DRG	**Description**
838	Chemo w Acute Leukemia As Sdx w CC or High Dose Chemo Agent
847	Chemotherapy w/o Acute Leukemia as Secondary Diagnosis w CC
837	Chemo w Acute Leukemia as Sdx or w High Dose Chemo Agent w MCC
846	Chemotherapy w/o Acute Leukemia as Secondary Diagnosis w MCC
981	Extensive O.R. Procedure Unrelated To Principal Diagnosis w MCC
330	Major Small & Large Bowel Procedures w CC
829	Myeloproliferative Disorders Or Poorly Differentiated Neoplasms w Other Procedure w CC/MCC
939	O.R. Proc w Diagnoses of Other Contact w Health Services w MCC
029	Spinal Procedures w CC or Spinal Neurostimulators
641	Misc Disorders of Nutrition,Metabolism,Fluids/Electrolytes w/o MCC
596	Major Skin Disorders w/o MCC
542	Pathological Fractures & Musculoskelet & Conn Tiss Malig w MCC
181	Respiratory Neoplasms w CC

Interleukin-2 or Other Central or Peripheral Vein Chemotherapy ICD-10-PCS Codes	
ICD-10-PCS	**Description**
3E03002	Introduction of high-dose interleukin-2 into peripheral vein, open approach
3E03003	Introduction of low-dose interleukin-2 into peripheral vein, open approach
3E03005	Introduction of other antineoplastic into peripheral vein, open approach
3E03302	Introduction of high-dose interleukin-2 into peripheral vein, percutaneous approach
3E03303	Introduction of low-dose interleukin-2 into peripheral vein, percutaneous approach
3E03305	Introduction of other antineoplastic into peripheral vein, percutaneous approach
3E04002	Introduction of high-dose interleukin-2 into central vein, open approach
3E04003	Introduction of low-dose interleukin-2 into central vein, open approach
3E04005	Introduction of other antineoplastic into central vein, open approach
3E04302	Introduction of high-dose interleukin-2 into central vein, percutaneous approach
3E04303	Introduction of low-dose interleukin-2 into central vein, percutaneous approach
3E04305	Introduction of other antineoplastic into central vein, percutaneous approach

BILLING CODE 4120–01–C

The applicant used the FY 2019 MedPAR file dataset with the FY 2019 Final Rule with Correction Notice IPPS Impact File and the FY 2022 New Technology Thresholds to perform their cost analyses. Using the FY 2019 MedPAR file dataset, the applicant's search resulted in the identification of 20 MS–DRGs to which cases in the primary cohort mapped, as previously listed. The applicant provided two sensitivity cohorts: (1) A principal or admitting ICD–10 diagnosis of melanoma and metastasis; and (2) any ICD–10 diagnosis of melanoma and metastasis. The applicant stated that the analysis was limited to Medicare discharges from facilities paid under the IPPS by only including hospitals listed in the FY 2019 Final Rule IPPS Impact File. The previously discussed criteria resulted in 220 claims from 20 MS–DRGs in the primary cohort, 1,052 claims from 79 MS–DRGs in the sensitivity cohort 1, and 6,988 claims from 369 MS–DRGs in sensitivity cohort 2. The applicant imputed a case count of 11 for those MS–DRGs with fewer than 11 cases, which per the applicant resulted in a significantly higher case count than if it used the actual case counts. The applicant stated that imputing the cases did not change the results of the charge threshold analyses presented below, and the final inflated average case-weighted standardized charge per case exceeded the case-weighted threshold in all scenarios regardless of whether the actual case count or minimum case count of 11 is used. For each cohort, the applicant provided multiple analyses, by first using the threshold from each MS–DRG included, second using the MS–DRG 018 threshold for all included MS–DRGs and the national pharmacy CCR (0.187) to calculate charges, and lastly using the MS–DRG 018 threshold for all included MS–DRGs and the applicant-calculated CAR T-cell CCR (0.314) to calculate charges. For example, in the first analysis, the applicant used a threshold amount of $62,724 for MS–DRG 838 but in second and third analyses the applicant used a threshold of $1,251,126 for MS–DRG 838 (the same threshold for MS–DRG 018). The applicant first calculated a case weighted threshold of $70,220, $72,889, and $67,947 for the primary, sensitivity one, and sensitivity two cohorts respectively based on a case-weighted average of the threshold amounts for the MS–DRGs to which the cases identified based on the claims data search mapped. The applicant calculated a case weighted threshold of $1,251,126 for all secondary calculations where the MS–DRG 018 threshold was applied for all MS–DRGs identified. We note, in section II.D. of this proposed rule, we are proposing to assign other immunotherapies MS–DRG 018 (for example Introduction of lifileucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7), in addition to CAR T-cell therapies. Therefore, it seems the appropriate threshold for comparison is that of MS–DRG 018, with an average case-weighted threshold amount of $1,251,126.

For the analyses using the MS–DRG 018 thresholds, to calculate the average charge per case, the applicant used the cases identified based on the claims data search and mapped them to the MS–DRG 018 threshold. To determine the charges for lifileucel, the applicant converted cost to charges by dividing by the FY 2021 IPPS/LTCH PPS final rule national average pharmacy CCR of 0.187, and in secondary analyses, by a CAR T-cell CCR of 0.314 calculated by the applicant. To estimate the CAR T-cell CCR, the applicant obtained the MS–DRG 018 arithmetic mean charge in the AOR/BOR FY2021 Proposed Rule File released by CMS ($1,387,946). The applicant subtracted publicly reported non-drug charges for TECARTUS of $201,610 from the total arithmetic mean charge to estimate CAR T-cell charges (approximately $1,186,336). The applicant then divided a CAR T-cell wholesale acquisition cost of $373,000 (WAC for those CAR T-cell products approved as of FY 2019) by the estimated CAR T-cell charges, to estimate a CAR T-cell CCR of 0.314 (CCR = 373,000/1,186,336).

The applicant stated no charges were removed for the prior technology because previous treatments will continue to be reflected in cases where

lifileucel is administered. Next the applicant calculated the average standardized charge per case using the FY 2019 IPPS/LTCH PPS final rule Impact file. The 2-year inflation factor of 13.2% (1.13218) was obtained from the FY 2021 IPPS/LTCH PPS final rule and applied to the average standardized charge per case.

The applicant calculated the final inflated average case-weighted standardized charge per case by adding the estimated charges for the technology to the inflated average standardized charge per case. The applicant determined a final inflated average case-weighted standardized charge per case of $2,188,043 and $1,355,334 from the primary cohort, pharmacy and CAR T-cell CCR analyses with CAR T-cell thresholds respectively, which both exceed the average case-weighted threshold amount of $1,251,126.

The applicant determined a final inflated average case-weighted standardized charge per case of $2,134,830 and $1,302,121 from the sensitivity cohort one using the pharmacy and CAR T-cell CCR analyses with CAR T-cell thresholds respectively, which both exceed the average case-weighted threshold amount of $1,251,126.

The applicant determined a final inflated average case-weighted standardized charge per case of $2,131,524 and $1,298,815 from the sensitivity cohort two using the pharmacy and CAR T-cell CCR analyses with CAR T-cell thresholds respectively, which both exceed the average case-weighted threshold amount of $1,251,126. Because the final inflated average case-weighted standardized charge per case for all the analyses exceeded the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion.

Based on the information provided by the applicant, we have the following concerns regarding the cost analysis.

As noted in previous discussions, the submitted costs for CAR T-cell therapies vary widely due to differences in provider billing and charging practices for this therapy. Therefore, with regard to the use of this data for purposes of calculating a CAR T-cell CCR, we are uncertain how representative this data is for use in the applicant's cost analyses given this potential for variability.

The applicant also uses both ICD–10 diagnosis code categories and subcategories which are not valid diagnosis codes and therefore, not appropriate to include for purposes of the cost analysis. There is a potential that inappropriately including ICD–10 diagnosis code categories and subcategories may alter the number of cases identified for inclusion in the cost analysis. We are seeking public comment on whether this issue may affect the cost analysis.

We continue to be interested in public comments regarding the eligibility of CAR T-cell technologies for new technology add-on payments when assigned to MS–DRG 018. As we have noted in prior rulemaking with regard to the CAR T-cell therapies (83 FR 41172 and 85 FR 58603 through 58608), if a new MS–DRG were to be created, then consistent with section 1886(d)(5)(K)(ix) of the Act, there may no longer be a need for a new technology add-on payment under section 1886(d)(5)(K)(ii)(III) of the Act. We invite public comments on whether lifileucel meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that lifileucel represents a substantial clinical improvement over existing technologies. In support of this assertion, the applicant provided data from two cohorts of the C–144–01 study, an ongoing phase 2, multicenter study (NCT02360579) consisting of four cohorts:

- Cohort 1 (n=30 generation 1 non-cryopreserved TIL product), not included for review as part of the applicant's new technology add-on payment application.
- Cohort 2 (n=60 generation 2 cryopreserved TIL product), included for review as part of the applicant's new technology add-on payment application.
- Cohort 3 (a sub-sample of n=10 from cohorts 1, 2, and 4), not included for review as part of the applicant's new technology add-on payment application.
- Cohort 4 (n=75 generation 2 cryopreserved TIL product), included for review as part of the applicant's new technology add-on payment application and also provided to the FDA as part of the applicant's BLA application.

The applicant stated that C–144–01 (NCT02360579) is a multi-cohort, Phase 2 clinical trial evaluating the safety and efficacy of lifileucel in patients that have been diagnosed with unresectable or metastatic Stage IIIc or IV melanoma. In addition to what the applicant previously described, the authors stated that in a sub-group analysis of 42 patients who were primary refractory to anti-PD–1, the ORR was 40.5% comparable to the overall cohort.

According to the applicant, the primary objective of this study was to evaluate the efficacy of lifileucel in patients with unresectable or metastatic melanoma using the objective response rate (ORR), as assessed by the independent review committee (IRC) per Response Evaluation Criteria in Solid Tumors (RECIST) version 1.1.[353] The applicant added that secondary objectives were to: (1) Evaluate the efficacy endpoints of duration of response (DOR), disease control rate (DCR), and progression free survival (PFS); (2) further evaluate the efficacy of lifileucel in patients with unresectable or metatstatic melanoma by assessing ORR, DOR, DCR, and PFS; (3) to evaluate overall survival (OS); and (4) to characterize the safety profile of lifileucel. For cohort 2, 60 patients were determined to allow estimation of the ORR using the maximum half width of the two-sided 95% confidence limit of less than 13.2% when ORR is expected to range from 20–50%. For cohort 4, approximately 75 patients were planned to be infused based on the null hypothesis of 10% ORR (based on historical control) which resulted in over 90% power to demonstrate superiority to this control. Patients included in this study were 18 years or older, had an ECOG (Eastern Cooperative Oncology Group) performance status of 0 or 1 upon entry, an estimated life expectancy of less than or equal to 3 months, and had unresectable or metastatic melanoma (stage IIIC or IV) treated with at least one prior systemic therapy including an anti-PD–1 antibody and a BRAF/MEK inhibitor. Patients were required to have a washout period of at least 28 days from prior anticancer therapy(ies) to the start of the planned nonmyeloablative lymphodeletion (NMA–LD) preconditioning regimen. The applicant explained that prior to the infusion of lifileucel, the patient receives NMA–LD with cyclophosphamide (60 mg/kg) intravenously daily for 2 days followed by fludarabine (25 mg/m^2) intravenously for 5 days to eliminate potentially suppressive immune cells which support the tumor and to maximize engraftment and potency of the lifileucel therapy through homeostatic proliferation.[354]

The applicant stated that the patients in this study had a high tumor burden at baseline and had received a mean of 3.3 lines (range, 1–9) of prior therapies. Twenty-eight patients (42%) had liver and/or brain lesions at baseline. Each prior line of therapy was defined as any

[353] Eisenhauer EA, et al. New response evaluation criteria in solid tumours: Revised RECIST guideline (version 1.1). European Journal of Cancer. 45 (2009) 228–247.

concomitant therapy given to the patient even if more than one target for each treatment was involved.[355] The applicant added that 77% of patients had progressed on prior anti-CTLA–4 blockade therapy, 99% had progressed on prior anti-PD–1/PD–L1 therapy, and 23% had received BRAF/MEK inhibitors. All patients had received PD on their prior therapy before study entry.

As justification for the null hypothesis of ORR less than or equal to 10%, the applicant stated that according to the NCCN guideline for metastatic melanoma, the only approved treatment is dacarbazine (DTIC) whereas other agents such as carboplatin, paclitaxel, docetaxel, nab-paclitaxel, and temozolomide are not approved by the FDA and are not appropriate as comparators. The applicant next presented the results from four studies which had at least one treatment arm receiving DTIC: (1) An abstract of a sample with metastatic melanoma previously treated with post-anti-PD–1 (no prior BRAF/MEK, metastatic melanoma) which resulted in a 10% ORR in the DTIC arm; [356] (2) a sample with advanced melanoma previously treated with post-ipilimumab (+/− BRAF inhibitor) which resulted in a 10.6% ORR in the DTIC arm, (3) a sample of treatment-naïve patients with unresectable stage IIIc or IV melanoma which resulted in a 9.8% ORR in the DTIC arm,[357] and (4) a sample of chemo-naïve patients with metastatic melanoma of which 9% had received prior therapy for metastatic disease which resulted in an 11% ORR in the DTIC arm.[358] The applicant stated that the historical control ORR of 10% for advanced melanoma was used for two reasons. First, the results from the first study (post-anti-PD–1) [359] most closely represent patients in the C–144–01 study because they received prior anti-PD–1 treatment while the other studies did not. Second, the applicant stated that response rates to chemotherapy, including DTIC, in recent phase 3 melanoma trials ranged from 4% to 10%.[360] [361] Also included in the application is a summary of results from six studies in patients treated with a DTIC monotherapy in advanced or metastatic melanoma prior to checkpoint inhibitor FDA approval which showed ORRs ranging from 5%–20%.

Next, the applicant discussed the efficacy results from the C–144–01 study. The applicant stated that regardless of location of tumor resected and BRAF mutational status, and across ages (20–79), patients responded to lifileucel therapy. Among patients in cohort 2 (n=66) there was an ORR of 36% (95% CI 25, 49) and a DCR of 80% (95% CI 69, 89). When considering best overall response, two patients (3%) achieved complete response (CR), 22 patients (33%) achieved partial response (PR), 29 patients (44%) achieved stable disease, 9 patients (14%) had progressive disease, and 4 patients (6%) were non-evaluable. The applicant highlighted that the ORR (36.5% for those less than 65 years and 35.7% for those 65 and older) and DCR (71.2% for those less than 65 years and 78.6% for those 65 and older) were consistent across age groups. The applicant contends that these results following the one-time, single infusion of lifileucel represent a substantial improvement over chemotherapy which offers poor ORR of 4%–10%.[362] [363]

Next, the applicant asserted that, because the median duration of response (DOR) had not been reached at a median follow-up of 18.7 months, the treatment effect will be durable and provide long-term benefit to those treated with lifileucel. The applicant stated that at the median follow-up, 50% (n=12) of responders showed ongoing response to lifileucel. The applicant added that the median DOR for treatment with DTIC is 5 to 6 months [364] [365] and that retreatment with an immune checkpoint inhibitor or chemotherapy has demonstrated a median overall survival of around 7–8 months.[366] [367]

Lastly, the applicant stated that the safety profile of lifileucel was consistent with the underlying advanced disease and the known toxicities associated with the single course of lymphodepleting preconditioning regimen and IL–2. The applicant stated that all patients experienced at least one treatment-emergent adverse event (TAEA) during the course of the study with the most common adverse event of any grade being hematologic along with chills, pyrexia, fatigue, tachycardia, and hypotension.[368] The applicant added that the most common grade ¾ TEAEs included thrombocytopenia (82%), anemia (56%), febrile neutropenia (55%), neutropenia (39%), hypophosphatemia (35%), leukopenia (35%), and lymphopenia (32%),[369] which were consistent with the lymphodepletion regimen and known profile of IL–2.[370] [371] [372] One patient died due to intra-abdominal hemorrhage reported as possibly related to TIL and one due to acute respiratory failure

[372] Dudley ME, et al. Adoptive cell therapy for patients with metastatic melanoma: Evaluation of intensive myeloablative chemoradiation preparative regimens. J Clin Oncol. 2008; 26(32): 5233–5239.

assessed as not related to TIL.[373] The applicant stated that there was no difference in the incidence of TEAEs (for example any grade, among grades 3 to 4, and among grade 5) in patients 65 or older as compared to those younger than 65. Furthermore, the applicant stated that AEs occurred and generally resolved within the first 14 days following TIL infusion and IL–2 administration, during which time patients typically remained in the inpatient setting.

In support of its claims regarding substantial clinical improvement, the applicant submitted four additional pieces of evidence.[374] [375] [376] [377] First is an article which describes the tumor-infiltrating lymphocytes (TIL) manufacturing process, the mechanism of action of these products, what the authors identify as clear advantages of TIL in the treatment of solid tumors, and lastly the results of C–144–01.[378] The authors stated that this onetime autologous treatment involves a product individually derived for each patient, is not selected for the recognition of shared antigens that would be expressed in normal tissues, and is specific to the tumor neoantigens, reducing the risk for autoimmune toxicity. The authors also stated that the TIL mechanism of action does not rely on engineered receptors but maintains some physiologic control and avoids hyperactivation, which therefore suggests that TIL offers a different safety profile compared to CAR T-cell products or ICIs.

The second piece of evidence provided by the applicant is a presentation given at the 2020 ASCO annual meeting [379] which, per the applicant, focused on the C–144–01 study design, overview, patient procedures, TIL manufacturing, and patient characteristics of cohort 2. The presentation asserts, as the applicant has previously, that there are currently no approved agents for patients with metastatic melanoma whose disease progressed after ICIs and BRAF/MEK inhibitors. The presentation repeats study design, patient characteristics of cohort 2, safety outcomes, and efficacy outcomes, as previously described by the applicant. The presentation states that the adverse event profile was consistent with the underlying advanced disease and the safety profile of the lymphodepletion and IL–2 regimens and adds that the median number of IL–2 doses administered was six. The author concluded that lifileucel had demonstrated potential efficacy and durability of response for patients with metastatic melanoma and that it represented a viable therapeutic option warranting further investigation (that is, pivotal Cohort 4).

The applicant next submitted an abstract from a poster presentation [380] that discusses the TIL manufacturing process and the previously discussed study C–144–01. The presentation adds that tumors resected at local institutions were processed in central Good Manufacturing Practice (GMP) facilities for TIL production in a 22-day process. Final TIL infusion product was cryopreserved and shipped to sites. Patients received one week of cyclophosphamide/fludarabine preconditioning lymphodepletion, a single lifileucel infusion, followed by up to 6 doses of IL–2. The authors conclude by stating that response per IRC assessment and concordance between investigator read ORR and IRC will be reported.

Lastly, the applicant submitted a peer-reviewed and published post summary presented at the Society for Melanoma Research 2019 annual meeting [381] that discusses the results of the C–144–01 study as previously discussed by the applicant and other presentations. The author added that TIL therapy uses a patient's own immune cells to attack cancer. Tumor-infiltrating lymphocyte cells are extracted from a patient's own tumor tissue, expanded through a proprietary process, and infused back into the patient. After infusion, tumor-infiltrating lymphocytes reach tumor tissue, where they attack tumor cells. Lastly the author concluded that lifileucel treatment resulted in a 36.4% overall response rate with a median duration of response having not been reached after a median of one year in patients with heavily pretreated metastatic melanoma with high baseline disease burden who received prior anti-PD–1 and BRAF/MEK inhibitors.

After review of the information provided by the applicant, we have the following concerns concerning the substantial clinical improvement criterion. We note that results provided by the applicant are based on an ongoing phase two trial, C–144–01, and that these are potentially partial results from which we may not be able to draw end conclusions. We also note the potential for overestimating treatment effects when trials stop early or report interim results.[382] [383] [384]

We question the selection of ORR as the primary outcome, which combines the results of complete and partial responders. Specifically, we question if the results experienced by those who are complete responders may substantially differ from those who are partial responders. We also question the appropriateness of combining these two groups together. Further, we note that the applicant used a surrogate endpoint (ORR) rather than overall survival or other measure. We believe that this measure may not be the most appropriate measure with which to evaluate substantial clinical improvement in this patient population because it may not capture patients' clinical experience as fully as a measure of overall survival at some later time point. We are seeking public comment on whether the ORR is an appropriate measure of efficacy of this and other treatments when considering substantial clinical improvement.

Lastly, we note that a historical control is used for all of the studies provided and that the analyses using this historical control do not account for baseline differences between the groups being compared. This makes it difficult to determine if the results seen are due to the treatment, random occurrences, or bias. Further, we note that the patient sample or samples used to construct the historical control may not be representative of the C–144–01 cohort. We are unable to verify the appropriateness of this historical control because the evidence describing the historical control takes the form of abstracts or was not provided.

We are inviting public comments on whether lifileucel meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for lifileucel.

k. Narsoplimab

The Omeros Corporation submitted an application for new technology add-on payments for narsoplimab for FY 2022. Narsoplimab is a fully human monoclonal antibody for the treatment of HSCT–TMA, also known as transplant-associated thrombotic microangiopathy (TA–TMA), for which the applicant has submitted a Biologics License Application (BLA). According to the applicant, narsoplimab inhibits mannan-binding lectin serine protease 2 (MASP–2), the effector enzyme of the lectin pathway of the complement system, and activation of the lectin pathway that prevents complement-mediated inflammation and exhibits anticoagulant effects while leaving intact the respective functions of the classical and alternative pathways of innate immunity. According to the applicant, there are currently no FDA-approved products indicated for the treatment of hematopoietic stem cell transplantation-associated thrombotic microangiopathy (HSCT–TMA).

According to the applicant, HSCT–TMA is a lethal complication of hematopoietic stem cell transplantation (HSCT) that results in thrombosis in the small blood vessels, leading to organ failure.[385] [386] [387] According to the applicant, clinical guidelines for the treatment of HSCT–TMA are being developed by members of the American Society for Transplant and Cellular Therapy (ASTCT) and are expected to be published in 2021. The applicant stated that current management of HSCT–TMA includes modification or cessation of any immune-suppressive regimen, appropriate treatment of infections and/or graft-versus-host disease (GvHD) if present, aggressive control of hypertension, and other supportive therapy as deemed appropriate by the treating physician.[388] However, according to the applicant, the withdrawal of immunosuppressive therapies and ongoing monitoring for resolution of TMA symptoms has been determined to be ineffective.[389] The applicant stated that there are multiple off-label treatments for HSCT–TMA which have either not been reviewed by the FDA or have been reviewed and not deemed adequate for registration purposes; these unapproved treatments include therapeutic plasma exchange (TPE), eculizumab, defibrotide sodium, rituximab, and vincristine sulfate. The applicant asserted that available evidence for agents used off-label to treat HSCT–TMA is derived from observational studies and case series with mixed results, and none of the agents have been evaluated for efficacy or safety in a robust clinical trial in patients with HSCT–TMA.[390] In summary, the applicant stated with regard to these unapproved therapies that: (1) The use of TPE is based on the extrapolation of its effectiveness for thrombocytopenic purpura with poor outcomes leading the Blood and Marrow Transplant Clinical Trials Network Toxicity Committee in 2005 to recommend that TPE not be considered as a standard of care for HSCT–TMA; [391] (2) eculizumab is a C5 inhibitor that blocks activation of the terminal cascade of complement [392] of which the use is constrained by lack of efficacy and safety evaluations by the FDA [393] and associated increased susceptibility to infections; [394] [395] (3) defibrotide (Defitelio®), an oligonucleotide mixture with profibrinolytic properties whose mechanism of action has not been fully elucidated [396] is not approved by the FDA for the treatment of HSCT–TMA nor considered a standard of care; (4) rituximab (Rituxan®), a monoclonal antibody that targets the CD20 antigen expressed on the surface of pre-B and mature B-lymphocytes,[397] is not approved by the FDA for the treatment of HSCT–TMA; and (5) Vincristine sulfate, a vinca alkaloid isolated as a 1:1 sulfate salt from the periwinkle plant is not approved by the FDA for the treatment of HSCT–TMA.[398]

With respect to the newness criterion, the applicant stated in its application that it is in the process of completing a rolling submission of a Biologics License Application (BLA) to the FDA for narsoplimab for the treatment of HSCT–TMA. According to the applicant, narsoplimab has received Orphan Drug designation and Breakthrough Therapy Designation from FDA for the treatment of patients with HSCT–TMA who have persistent thrombotic microangiopathy despite modification of immunosuppressive therapy. The applicant submitted a request for approval for a unique ICD–10–CM code for HSCT–TMA and an

ICD–10–PCS code for the administration of narsoplimab; there are currently no ICD–10–CM codes that describe HSCT–TMA or ICD–10–PCS codes that describe narsoplimab.

If a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, the applicant asserted that narsoplimab has a unique mechanism of action as it is the first therapeutic to target mannan-binding lectin serine protease 2 (MASP–2) and the first to inhibit the lectin pathway of the complement system. The applicant stated that MASP–2 inhibition specifically blocks the lectin pathway of complement but does not inhibit the classical and alternative pathways, leaving the complement system's effector function in adaptive immunity intact, which is important for fighting infection.[399] [400] According to the applicant, the mechanism of action of narsoplimab not only results in inhibition of lectin pathway-mediated activation of complement, but also blocks the MASP–2 mediated procoagulant activities in the coagulation cascade. The procoagulant effects of MASP–2, independent of its role in the complement system, include the conversion of prothrombin to thrombin as well as the activation of Factor XII to XIIa.[401] [402] [403] In addition, MASP–2 is activated by fibrin and activated platelets, further augmenting a procoagulant state.[404] The applicant asserted that by inhibiting these procoagulant activities of MASP–2, narsoplimab provides important anticoagulant benefits, without affecting bleeding parameters (that is, prothrombin time, activated partial thromboplastin time, international normalized ratio, or bleeding time). According to the applicant, narsoplimab is the only drug that addresses all the components of HSCT–TMA and is the only product that inhibits complement activation and has anticoagulant activity. Therefore, the applicant asserts that the mechanism of action of narsoplimab differs from that of the products occasionally used off label: eculizumab, defibrotide sodium, rituximab, and vincristine.

With respect to the second criterion, whether a product is assigned to the same or different MS–DRG, the applicant stated that patients who receive narsoplimab will be assigned to the same DRGs as patients who are diagnosed with HSCT–TMA/transplant-associated thrombotic microangiopathy (TA–TMA) regardless of the treatment.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant stated that narsoplimab treats a different disease than existing technologies. According to the applicant, when treating HSCT–TMA, clinicians may rely on approaches that have limited efficacy [405] such as to reduce or discontinue anti-GVHD therapies (for example, calcineurin inhibitors), initiate therapeutic plasma exchange (TPE), and/or administer anti-CD20 antibody therapies, terminal complement inhibitors and/or oligonucleotide therapies.[406] [407] [408] The applicant stated that narsoplimab will be the first technology specifically indicated to treat HSCT–TMA.

According to the applicant, existing products that are currently used off-label to treat HSCT–TMA patients are indicated for the treatment of other distinct diseases. Eculizumab is indicated for: (1) The treatment of patients with paroxysmal nocturnal hemoglobinuria (PNH) to reduce hemolysis; (2) the treatment of patients with atypical hemolytic uremic syndrome (aHUS) to inhibit complement-mediated thrombotic microangiopathy; (3) the treatment of anti-acetylcholine antibody-positive generalized myasthenia gravis; and (4) the treatment of anti-aquaporin-4 (AQP4) antibody-positive neuromyelitis optica spectrum disorder (NMOSD).[409] Defibrotide sodium is indicated for the treatment of adult and pediatric patients with hepatic veno-occlusive disease (VOD) with renal or pulmonary dysfunction following HSCT.[410] The applicant further asserted that HSCT–TMA is different from aHUS due to varying underlying causes (that is, Shiga toxin infection, genetic mutation),[411] its association with receipt of a stem cell transplant and associated endothelial cell injury,[412] and aHUS resulting from mutations and/or polymorphisms in complement genes rather than having received an HSCT.[413] [414] In regard to VOD, the applicant asserts that while this patient population is similar to HSCT–TMA patients with regard to both having received HSCT, VOD is a separate disease affecting only the liver whereas HSCT–TMA is a multi-factorial disease impacting many organ systems, such as the kidneys, the lungs, the CNS and the gastrointestinal tract.[415]

Furthermore, the applicant summarized key distinctions between HSCT–TMA and the diseases for which

the other off-label therapeutics are indicated (eculizumab, defibrotide sodium, plasmapheresis with fresh frozen plasma and rituximab). According to the applicant, HSCT–TMA is associated with HSCT endothelial cell injury, has unique triggers such as immune dysregulation caused by infection, chemotherapy, and GVHD, and involves the initiation of the complement system including the lectin pathway. Atypical hemolytic uremic syndrome (aHUS), treated by eculizumab, is associated with unchecked abnormal activation of alternative complement system due to genetic mutations in complement factors or inhibitory autoantibodies to factor H and I and has an onset that is idiopathic or secondary to triggers such as infection, fever, pregnancy, malignant hypertension, transplant, and diarrheal illnesses. Veno-occlusive disease (VOD), treated by defibrotide sodium, is a complication observed after HSCT where sinusoidal endothelial cells and hepatocytes in zone 3 of the hepatic acinus are damaged by toxic metabolites generated during the conditioning regimen. Thrombocytopenic purpura (TTP), treated by plasmapheresis with fresh frozen plasma and rituximab, is characterized by an ADAMTS–13 deficiency that is not commonly seen in HSCT–TMA with decreased ADAMTS activity due to genetic alterations to the gene or presence of inhibitory autoantibodies.

In summary, the applicant believes that narsoplimab is not substantially similar to other currently available therapies and/or technologies and meets the ''newness'' criterion. We note that the applicant asserts that there are no FDA-approved products indicated for the treatment of HSCT–TMA and we are inviting public comment on whether narsoplimab therefore has a unique mechanism of action. In addition, we note that although the cause or triggers of thrombotic microangiopathy may be different between HSCT and for example HUS or TTP, the resulting disease may be similar. We welcome public comments on whether HSCT–TMA is a similar disease to other forms of TMA.

We are inviting public comments on whether narsoplimab is substantially similar to other currently available therapies and/or technologies and whether this technology meets the newness criterion.

With regard to the cost criterion, the applicant provided the following analysis to demonstrate the technology meets the cost criterion. The applicant stated that due to what it described as a lack of sufficient coding in the HSCT–TMA space, the applicant provided multiple scenarios to show that narsoplimab meets the cost criterion. The applicant stated they are not requesting that narsoplimab map to a new or different MS–DRG.

The applicant used the full calendar year 2019 National Medicare 100% inpatient Limited Dataset to identify patients with a combined diagnosis of history of stem cell transplantation (SCT, ICD–10 code Z94.84) OR complications of stem cell transplant (ICD–10 code T86.5) AND thrombotic microangiopathy (TMA, ICD–10 code M31.1) OR hemolytic-uremic syndrome (HUS, ICD–10 code D59.3). Claims from PPS-exempt hospitals were excluded. In the base case analysis where all MS–DRGs were included, a total of 83 cases across 38 MS–DRGs were identified. The applicant imputed a case count of 11 for those MS–DRGs with fewer than 11 cases, which increased the number of claims from 83 to 396 because all MS–DRGs had fewer than 11 claims. The applicant then varied this initial analysis in two ways. First, sensitivity analyses one and two varied the reduction for the charges related to the prior technology to 25 percent and 50 percent of prior related therapy charges, respectively, which are possibly tied to decreased length of stay and/or decreased ICU utilization. Second, the applicant provided four scenarios which varied the price of narsoplimab from zero to three greater values.

The applicant first calculated a case weighted threshold of $96,810 for all scenarios based upon the dollar threshold for each MS–DRG grouping and the proportion of cases in each MS–DRG. The applicant then calculated the average charge per case. The applicant stated that because narsoplimab is an adjunctive therapy, no charges for a prior technology or a technology being replaced were removed. In the base case analysis, no charges related to the prior technology were removed because narsoplimab is not anticipated to offset standard of care costs. However, according to the applicant, because of a reduction in complications leading to mortality and other clinically significant complications, narsoplimab is anticipated to decrease the rate of hospitalization and length of stay. Therefore, two sensitivity analyses were included which removed 25 percent and 50 percent of prior related therapy charges which could potentially be related to a decrease in length of stay and/or decrease in ICU utilization in sensitivity analyses one and two, respectively. The applicant stated the 50% charge reduction analysis was performed as an extreme analysis to examine the unlikely possibility that narsoplimab offsets a considerable amount of costs associated with treating TMA. Because of the reduction in complications leading to mortality and other clinically significant complications, the applicant asserted that for many with long-term sequelae, narsoplimab is anticipated to decrease the rate of hospitalization and length of stay. Next the applicant calculated the average standardized charge per case using the FY 2021 IPPS/LTCH PPS final rule Impact file. The 2-year inflation factor of 13.2% (1.13218) was obtained from the FY 2021 IPPS/LTCH PPS final rule and applied to the average standardized charge per case.

To determine the charges for narsoplimab, the applicant converted cost to charges by dividing by the FY 2021 IPPS/LTCH PPS final rule national average drug CCR of 0.187. No charges related to the use of the technology were added by the applicant because utilization of narsoplimab is not anticipated to result in incremental costs. The applicant calculated the final inflated average case-weighted standardized charge per case by adding the charges for the technology to the inflated average standardized charge per case. In the base analysis where a technology related price of $0 was used, the applicant determined a final inflated average case-weighted standardized charge per case of $363,815, which exceeds the average case-weighted threshold amount of $96,810. In the same base analysis, the applicant determined a final inflated average case-weighted standardized charge per case of $272,861 in scenario one of the sensitivity analyses, which exceeds the average case-weighted threshold amount of $96,810. Lastly, in the same base analysis, the applicant determined a final inflated average case-weighted standardized charge per case of $181,908 in scenario two of the sensitivity analyses, which exceeds the average case-weighted threshold amount of $96,810. The applicant then provided a secondary cost analysis where the price of narsoplimab was the average of the three greater values used as the charges for the technology, and identified a final inflated average case-weighted standardized charge per case of $898,574, $807,621, and $716,667 in the base, 25 percent sensitivity, and 50 percent sensitivity analyses respectively.

We note that in its application, the applicant only provided, in Excel format, the primary base analysis without sensitivity scenarios. We are therefore unable to verify all other analyses, to include the sensitivity

analyses, discussed in this section and in the application. The applicant includes many MS–DRGs which are defined by other factors which may or may not be related to the intended indication for narsoplimab. For instance, the applicant identified MS–DRG 193 (Simple Pneumonia and Pleurisy with MCC) for inclusion in the cost analysis. Therefore, we are uncertain if the cases identified in the preceding cost analysis adequately identify potential cases eligible for narsoplimab. We are seeking public comment with regard to whether the MS–DRGs used in these cost analyses are appropriately representative of the cases that would be eligible for use of the technology. We invite public comments on whether narsoplimab meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that narsoplimab represents a substantial clinical improvement over existing technologies. According to the applicant, compared to the current recommendation of cessation of immunosuppressive therapies, narsoplimab demonstrates a substantial clinical improvement for the treatment of HSCT–TMA because it fulfills an unmet need for patients, demonstrated a statistically significant complete response rate in the pivotal clinical trial, provides a reduction in clinically significant adverse events, resulted in higher 100-day survival rates, decreases the rate of subsequent therapeutic interventions, and is anticipated to decrease the rate of hospitalizations and length of stay.

The applicant asserts that narsoplimab offers a treatment option for a patient population unresponsive to current available treatments. According to the applicant, the FDA awarded narsoplimab Breakthrough Therapy designation after reviewing literature for patients similar to those in the applicant's pivotal trial. The applicant states that if approved by the FDA, narsoplimab will be the only drug or biological approved for the treatment of HSCT–TMA.

In support of the assertion that narsoplimab offers a treatment option for patients unresponsive to currently available treatments, the applicant provided an abstract of their pivotal trial, a single-arm trial of 28 adult HSCT–TMA patients.[416] The abstract states that patients who had not responded to immunosuppression modification and who had thrombocytopenia, evidence of microangiopathic hemolytic anemia, and increased creatinine were included in the study. The applicant adds that patients with mild disease were excluded from the study. Patients received narsoplimab intravenously once weekly for four or eight weeks with a 6-week follow up period. The primary endpoint was a response-based composite measure requiring improvement both in laboratory TMA markers (platelet count and Lactate Dehydrogenase (LDH)) and in clinical status (that is organ function). Secondary endpoints were surivival and changes in laboratory TMA markers. The applicant asserts that a complete response rate of 15% was identified in conjunction with the FDA as the threshold to demonstrate efficacy for narsoplimab. The applicant states that narsoplimab resulted in a 61% complete response rate (CRR) in patients with HSCT–TMA who received at least one dose of the drug; the per protocol analysis (that is, patients who received at least the per-protocol-specified 4 weeks of treatment) resulted in a 74% complete response rate. The applicant states that these complete response rates are higher than the expected response of 10% to 15% in the absence of narsoplimab.

In applying for Breakthrough Therapy designation, the applicant states that a literature review was conducted to identify studies in a patient population similar to that in the pivotal trial. Searching in PubMed using pre-identified search terms (transplant-associated thrombotic microangiopathy; thrombotic microangiopathy stem cell; and cancer-associated thrombotic microangiopathy), the applicant identified nine references that met inclusion criteria and excluded an unknown number of articles because the patient data was not included in the publication. Studies were included if they were published in the year 2000 or later and included: (1) Survival data for patients; (2) documentation that immunosuppression was modified; and (3) documentation of patient response to immunosuppression modification.[417]

Of the nine studies included, there was a mean sample size of 7.4 ranging from 1–17 totaling 67 participants. The applicant identified a median overall survival of 21 days (95% CI 15–29) which ranged from 7 to 43 days. The applicant compared these results to those of the pivotal trial, where 16 of 28 patients died with a median overall survival of 274 days ($p < 0.0001$) compared via a log-rank test to that identified in the literature review. The applicant stated that a one-hundred-day survival post HSCT–TMA diagnosis was observed in 68% (n=28) of the full analysis set, 83% (n=23) in the patients treated per the protocol, and 94% (n=17) of complete responders.

The applicant asserted that in a high-risk study population, narsoplimab demonstrated substantial clinical improvement compared to current treatment approaches, meaningfully decreasing the rates of clinically significant complications, including mortality, and reducing the need for subsequent interventions; as a result, narsoplimab is anticipated to decrease the rate of hospitalization and length of stay. The applicant stated that the primary objectives in the pivotal study for narsoplimab were to evaluate safety, tolerability, and response-based efficacy requiring improvement in TMA laboratory markers of platelet count and LDH and improvement in clinical status on the basis of transfusions, renal, pulmonary, gastrointestinal, and neurological symptoms. The applicant stated that platelet count on average increased from baseline over time, LDH decreased from baseline, haptoglobin steadily increased from baseline, and hemoglobin increased over time with the use of narsoplimab. The applicant reported that overall 48% and 55% of patients had freedom from red blood cell and platelet transfusions, respectively. The applicant asserted that due to the decreased rate of complications, narsoplimab has the potential to lead to decreased hospital length of stay as well as decreased intensive care usage.

Lastly, the applicant asserted that narsoplimab is well tolerated with no treatment related complications. The applicant stated that the most common adverse events in the pivotal trial were nausea, vomiting, diarrhea, hypokalemia, neutropenia, and fever, which are comparable to those typically seen in the post-transplant population. Six deaths (21%) occurred, collectively, from sepsis, AML progression, and graft-versus host disease, which according to the applicant are causes of death common in patients with HSCT.

In addition to the previously discussed pivotal trial abstract, the applicant submitted four additional citations (three case studies and one case series) in support of the substantial clinical improvement of narsoplimab. The first citation is described by the

[416] Rambaldi, A et al. Narsoplimab for the treatment of Adult Hematopoietic Stem Cell Transplant-Associated Thrombotic Microangiopathy European Hematology Society. Abstract S262. 2020.

[417] Rambaldi, A et al. Improved survival following OMS721 treatment following hematopoietic stem cell transplant-associated thrombotic microangiopathy (HCTTMA). European Hematology Society. Stockholm, June 15, 2018. Abstract PF724.

applicant as a case study of an 18-year-old patient with biopsy-proven HSCT–TMA of the gastrointestinal tract which required transfusions. The applicant states that the patient received narsoplimab which led to the resolution of TMA and all transfusions were discontinued. The applicant submitted an educational agenda in support of this citation which does not provide any additional information.[418]

The second citation concerns the results of a case study of a 14 year-old patient who did not tolerate eculizumab for the treatment of HSCT–TMA and was treated successfully with OMS721 (*i.e.,* narsoplimab). The applicant submitted the abstract which states that after receiving allogeneic HSCT, the patient began to show progressive deterioration.[419] The patient was treated twice with eculizumab at months seven and eleven both resulting in pulmonary edema. The patient next received narsoplimab after which he began to improve and did not experience any adverse events.

The third citation is a presentation given at the European Society for Blood and Marrow Transplantation in 2017 [420] which discusses a 46-year-old patient with T-acute lymphoblastic leukemia who received HSCT. The applicant states this case study is about a patient with HSCT–TMA and late-onset acute GI GVHD who was treated with narsoplimab which resulted in the resolution of melena and hemolysis, increased platelets, and neurologic improvements over 354 days.

Lastly, the applicant submitted a presentation which discusses the results of a case series.[421] The applicant states that laboratory marker and clinical improvement were seen following narsoplimab treatment in severely ill, complex patients with HSCT–TMA. The case series included results from 2 patients (age 19 and age 48), both of whom underwent HSCT, the latter of which was HIV positive. The 19-year-old patient received 18 doses of narsoplimab showing favorable response with resolution of gastrointestinal bleeding and microangiopathic hemolytic anemia. The 48-year-old patient received eight doses of narsoplimab, but despite partial improvement remained on transfusions and dialysis until sudden death on day 31.

After review of the provided information and citations we have concerns with regard to the substantial clinical improvement criterion. Firstly, the sample from which the applicant draws conclusions is small (sample size of pivotal trial 28, plus five case studies). Furthermore, we are unable to verify the methods, results, and conclusions of these studies as the applicant only provided evidence in the form of abstracts and presentations. For example, one citation provided by the applicant in the form of a non-peer-reviewed conference poster details interim results from what appear to be the pivotal trial.

With regard to methodological concerns, first, we note the potential for overestimating treatment effects when trials stop early or report interim results.[422] [423] [424] Second, the authors pool data from an historical cohort of patients drawn from published literature to calculate survival rates in patients with HSCT–TMA and then retrospectively compare these rates to the survival in their treated cohort. We are unable to evaluate the appropriateness of this historical comparison cohort based on the evidence provided in the form of two citations, an abstract [425] and a poster.[426] This analysis may not adequately account for baseline differences between the patients treated with narsoplimab and the patients across the articles from which a historical control was developed. In addition, we note that we may lack the ability to evaluate whether this literature review to obtain the historical control effectively identified the historical control, as the applicant only provided general details on how the search was performed.

We further note that the study design described in the pivotal trial, upon which the applicant bases its claims for substantial clinical improvement, was not appropriately designed to test for comparisons with another treatment such as an historical control. Furthermore, the methods utilized in the pivotal trial do not lend themselves to making statistical inferences based on the provided protocol (for example, no power assessment performed, no assessment for multiple comparisons, no pre-identified alpha).

We are inviting public comments on whether narsoplimab meets the substantial clinical improvement criterion.

We received one written comment in response to the New Technology Town Hall meeting notice published in the **Federal Register**. The commenter stated that they are enthusiastic about the results of the single arm open-label trial OMS721–TMA–001 evaluating narsoplimab for the treatment of HSCT–TMA. The commenter added that narsoplimab offers a treatment option for these high-risk patients that appears to markedly increase complete response rates with a substantial reduction in clinically significant complications including mortality. The commenter stated that the approval of the application for new technology add-on payments will help ensure appropriate patients will get the benefit of narsoplimab for treatment of HSCT–TMA.

Response: We appreciate the commenter's input and will take this comment into consideration when deciding whether to approve new technology add-on payments for narsoplimab for FY 2022.

l. NexoBrid™

Vericel Corporation submitted an application for NexoBrid™ for new technology add-on payments for FY 2022. According to the applicant, NexoBrid™ is a novel, non-surgical option for eschar removal (debridement). Eschar is the dead tissue and dried secretions from a skin wound following a burn, and removal is essential for wound healing. According to the applicant, NexoBrid™ is a mixture of proteolytic enzymes (enriched in bromelain) and has been developed for patients with deep partial thickness (DPT) and/or full thickness

(FT) thermal burns. According to the applicant, NexoBrid™ has not yet received approval from FDA. The applicant further noted that NexoBrid™ was approved by the European Medicines Agency (EMA) in 2012 and is currently commercially available in many countries.

The applicant stated that timely, rapid debridement of eschar in burn patients is necessary for assessing the burn injury, initiating the wound healing process, and preventing further complications, such as local infection, sepsis and extension of the burn injury.[427] [428] [429] The applicant stated that NexoBrid™ has been identified by the Biomedical Advanced Research and Development Authority (BARDA) as a critical medical countermeasure to address the public health emergency need for a debridement product for the treatment of burns in adults, especially for mass casualty events, where surgical capacity is limited, and rapid assessment of burn severity and intervention are imperative.[430]

The applicant stated that the current standard of care for burn debridement includes surgical and non-surgical approaches. The applicant stated that the surgical approach relies primarily on surgical tangential excision through use of sharp instruments such as scalpels and dermatomes.[431] [432] The applicant stated that surgical procedures include minor excision, avulsion, hydrosurgery (for example, VERSAJET™), scraping, brushing, dermabrasion, and excisions.[433] The applicant stated that non-surgical standard of care treatments include enzymatic debridement such as clostridial collagenase ointment (example, SANTYL®), antimicrobial agents such as silver sulfadiazine (example, SILVADENE®), or various hydrogels.[434] [435] [436] [437] [438] [439]

According to the applicant, NexoBrid™ is a botanical and biologic product for topical use and is comprised of two components: The NexoBrid™ powder that contains the active pharmaceutical ingredient (API) and a Gel Vehicle. The NexoBrid™ API is a concentrate of proteolytic enzymes enriched in bromelain extracted from pineapple stems. The applicant stated that the mechanism of action of NexoBrid™ is mediated by the proteolytic activity of its enzymes and is associated with selective debridement of eschar and denatured collagen while sparing healthy tissue.

The applicant stated that according to the American Hospital Association (AHA) Coding Clinic, ''Non-excisional debridement is coded with root operation 'extraction' ''.[440] The applicant added that NexoBrid™ could be identified with ICD–10–PCS code series 0HD Extraction of Skin or 0JD Extraction of subcutaneous tissue and fascia. The applicant stated that it has not requested that its technology map to a new or different MS–DRG.

With respect to the newness criterion, the applicant stated they have not yet received FDA approval. The applicant submitted a Biologic License Application (BLA) for NexoBrid™ for FDA approval on June 30, 2020 on the basis of two pivotal Phase 3 clinical trials. In September 2020, the FDA accepted the application and communicated a PDUFA date of June 29, 2021.

The applicant indicated that the ICD–10–PCS code series for non-excisional debridement, 0HD (Extraction of Skin) or 0JD (Extraction of subcutaneous tissue and fascia) could be used to identify NexoBrid™ use. The applicant indicated that NexoBrid™ is not separately identified with a unique ICD–10–PCS code. The applicant submitted a request for an ICD–10–PCS code to uniquely identify the use of NexoBrid™ beginning in FY 2022.

As discussed previously, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would, therefore, not be considered ''new'' for purposes of new technology add-on payments.

With respect to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, the applicant stated that NexoBrid™ is unique due to the bromelain active ingredient, which is extracted from pineapple stems. The applicant claimed that a search of the FDA website for the key words ''bromelain'' and ''pineapple'' did not yield any approved applications under section 505(b)(1) of the Federal Food, Drug, and Cosmetic (FD&C Act) or section 351(a) of the Public Health Service (PHS) Act.

With respect to the second criterion, whether a product is assigned to the same or a different MS–DRG, the applicant did not address the question directly, but stated that no existing technology used now or previously is similar to NexoBrid™ that would be captured under burn MS–DRGs as identified in the following table.

Current MS-DRG for Burns	MS-DRG Description
003	ECMO or Tracheostomy w MV >96 Hours or Principal Diagnosis Except Face, Mouth, and Neck w Major O.R. Procedures.
927	Extensive Burns or Full Thickness Burns w MV >96 Hours w Skin Graft.
928	Full Thickness Burn w Skin Graft or Inhalation Injury w CC/MCC.
929	Full Thickness Burn w Skin Graft or Inhalation Injury w/o CC/MCC.
934	Full Thickness Burn w/o Skin Graft or Inhalation Injury.
935	Non-Extensive Burns.

[440] American Hospital Association (AHA) Coding Clinic, Volume 2, number 1, 2015, pg 23

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease, and the same or similar patient population when compared to an existing technology, the applicant stated that NexoBrid™ does treat the same patient population as existing approaches to eschar removal. The applicant further stated that the ability to use NexoBrid™ at the bedside offers an effective option for rapid eschar removal that avoids the operating room, and that the ability to use NexoBrid™ in delicate areas offers particular value in burn treatment.

We have the following concerns regarding whether the technology meets the substantial similarity criteria and whether it should be considered new. While the applicant discussed the differences between NexoBrid™ and products made by other manufacturers, we note the applicant does not provide enough information regarding the composition of the proteolytic enzymes used within the NexoBrid™ active pharmaceutical ingredient, its mechanism of action, and how the ingredient(s) differs from other enzymatic debridement products on the market. Specifically, it is not clear whether the proteolytic enzyme is a type of collagenase similar to existing collagenase based enzymatic debridement products, since the applicant claimed that NexoBrid™ debrides denatured collagen in the wound. In addition, the applicant states that NexoBrid™ uses a new ingredient but does not explain how this represents a new mechanism of action. We also note that, while the applicant did not state so directly, we believe that patients treated using NexoBrid™ would be assigned to the same MS–DRGs as those patients who were treated with competitive products or services used for burns. We further note that the applicant did not suggest that NexoBrid™ was used to treat a different population from existing treatments.

We are inviting public comments on whether NexoBrid™ is substantially similar to other currently available therapies and/or technologies, and whether NexoBrid™ meets the newness criterion.

With regard to the cost criterion, the applicant provided two scenarios: Scenario 1: without grafting, which excluded cases with an ICD–10–PCS code for replacement of skin, and Scenario 2: with grafting, which required at least one ICD–10–PCS code for replacement of skin. Under the first scenario, the applicant searched the FY 2019 MedPAR dataset for cases reporting ICD–10–CM diagnosis codes for second- or third-degree burns as a primary diagnosis, and an ICD–10–PCS code(s) for excision or extraction of skin or subcutaneous tissue and fascia; these criteria resulted in the identification of 347 cases mapping to three unique MS–DRGs. Under the second scenario, the applicant again searched the FY 2019 MedPAR dataset for the same ICD–10 codes but with an additional ICD–10–PCS code for replacement of skin. Under the second scenario, the applicant identified 1,283 cases mapping to five unique MS–DRGs. In the following tables the applicant lists the MS–DRGs to which cases are assigned in each scenario:

Scenario 1 Burn with Excision or Extraction without Grafting	
MS-DRG	**Description**
935	Non-Extensive Burns
934	Full Thickness Burn w/o Skin Graft or Inhalation Injury
928	Full Thickness Burn w Skin Graft or Inhalation Injury w CC/MCC

Scenario 2 Burn with Excision or Extraction and Grafting	
MS-DRG	**Description**
928	Full Thickness Burn w Skin Graft or Inhalation Injury w CC/MCC
929	Full Thickness Burn w Skin Graft or Inhalation Injury w/o CC/MCC
935	Non-Extensive Burns
927	Extensive Burns or Full Thickness Burns w MV >96 Hours w Skin Graft
003	ECMO or Tracheostomy w MV >96 Hours or Principal Diagnosis Except Face, Mouth and Neck w Major O.R. Procedures

With respect to the MS–DRGs identified based on the claims search and included in the cost analysis, particularly MS–DRG 003, the applicant confirmed that this MS–DRG was appropriately representative of potential NexoBrid™ patients.

The applicant used the FY 2019 MedPAR LDS file with the FY 2022 New Technology thresholds to calculate the case-weighted thresholds, and the FY 2019 FR IPPS/LTCH PPS standardizing file to standardize charges. The applicant then removed 100 percent of the operating room charges and 24.5 percent of the blood charges from the identified cases to conservatively estimate the charges that potentially may be avoided through the use of NexoBrid™. After standardizing the charges, the applicant applied what it indicated was the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges of 13.1 percent. We note that the inflation factor was 13.2 percent (1.13218) for FY 2021 (85 FR 59039), which would have resulted in higher inflated charges. To calculate the charges for the technology, the applicant divided the cost of the technology by the national average CCR for the Drugs cost center of 0.187 from the FY 2021 IPPS/LTCH PPS final rule.

Under scenario one, the applicant calculated a final inflated case-weighted average standardized charge per case of $95,828, which exceeded the average case-weighted threshold amount of $55,536. Under scenario two, the final inflated average case-weighted standardized charge per case of $334,405 exceeded the average case-weighted threshold amount of $168,985. The applicant stated that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount for both scenarios, the technology meets the cost criterion.

According to the applicant, NexoBrid™ is indicated for the treatment of thermal burns. The cost analysis performed by the applicant includes MS–DRG 003 (ECMO or Tracheostomy w MV >96 Hours or Principal Diagnosis Except Face, Mouth and Neck w Major O.R. Procedures), which per the applicant is appropriately representative of potential NexoBrid™ patients. However, MS–DRG 003 does not appear to be representative of the target patient population for NexoBrid™. We are seeking public comment on whether the use of this MS–DRG and others for the cost analysis appropriately reflects the potential cases treated by the technology.

We are inviting public comment on whether NexoBrid® meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that NexoBrid™ can be used in a patient population that is unresponsive to, or ineligible for currently available treatments because NexoBrid™ can be used at the bedside and is therefore an effective eschar removal option for patients for whom surgery or general anesthesia may be contraindicated. The applicant asserted that NexoBrid™ allows for the diagnosis of a medical condition in a manner different from existing technology because it allows for depth-of-burn diagnoses of indeterminant depth and/or mixed depth wounds. The applicant also asserted that NexoBrid™ represents a substantial clinical improvement due to significantly improved clinical outcomes in the following ways: (1) Reduction in clinically significant adverse events by reducing the surgical burden associated with surgical excision, reducing donor site morbidity due to reduced autografting, reducing blood loss due to adoption of a non-surgical approach, and reduced usage of surgical escharotomies; (2) decreased rate in a subsequent diagnostic or therapeutic intervention by reducing the need for surgical excision and reducing the need for autografts; (3) improved quality of life due to reduced scarring associated with reduction in autografting; and (4) NexoBrid™ is aligned with key benefits to elderly burn patients who may be too unwell for surgical excision.

The applicant asserted that because NexoBrid™ can be used at the bedside, it provides a unique non-surgical option for rapid, consistent eschar removal in patients for whom surgery or general anesthesia may be contraindicated. The applicant claimed that currently available non-surgical eschar removal procedures are generally considered inefficient, can result in a lengthy sloughing period, and have the potential for development of granulation tissue and increased infection and scarring.[441] [442] [443]

The applicant submitted two pivotal Phase 3 clinical trials to primarily support its claims of substantial clinical improvement. The DETECT study (NCT02148705) is a multi-center, multi-national, assessor blinded, randomized, 3:3:1 controlled, three-arm study from which data is not yet publicly available. Per the applicant, this study aimed to demonstrate superiority of NexoBrid™ treatment over Gel Vehicle (placebo) control and standard of care treatment, in hospitalized adult subjects with DPT and/or FT thermal burn of 3–30% total body surface area (TBSA) and total burn wounds of no more than 30% TBSA. A total of 175 subjects were randomized in to the DETECT study with 169 subjects being treated with NexoBrid, SOC consisting of surgical and/or nonsurgical treatment as per the investigators' discretion, or placebo.[444] NCT00324311 is an earlier multi-center, open-label, randomized, controlled clinical trial including 156 patients aged 4–55 years with deep partial and full thickness burns covering 5–30% TBSA. Patients were randomly assigned to burn debridement with NexoBrid™ or standard of care, which included surgical excisional or non-surgical debridement.[445]

The applicant asserted that in patients with indeterminant partial-thickness and/or mixed depth burns, NexoBrid™ debridement allows for a more accurate assessment of burn depth. The applicant stated, ''each additional non-autografted NexoBrid™-treated patient (relative to standard of care eschar removal) has an indeterminate superficial partial thickness wound that would otherwise have been incorrectly diagnosed as a deep partial thickness wound.'' The applicant suggested that deep partial thickness wounds require autografting. The applicant noted that the Phase 3 clinical trial NCT00324311 of patients with DPT and FT thickness had burns ranging from 5–30%TBSA.[446] The applicant claimed that it can be estimated that approximately 16.2% of NexoBrid™ treated wounds (34.1% autograft rate in standard of care group minus 17.9% autograft rate in the NexoBrid™ treated group) would have been autografted had other standard of care methods for burn debridement been used.

The applicant asserted that the use of NexoBrid™ as a non-surgical option for treatment reduces potential adverse events that may be associated with surgery or general anesthesia such as blood loss. The applicant noted that in the DETECT trial, median blood loss during eschar removal was significantly higher in the standard of care arm compared with NexoBrid™. It also noted that the NCT00324311 trial demonstrated smaller reductions in hemoglobin and hematocrit values before and after treatment in the NexoBrid™ arm compared to the standard of care arm.

The applicant asserted that the use of NexoBrid™ may reduce instances of surgical escharotomies which may be needed when a circumferential eschar produces a tourniquet effect that compromises circulation or movement.[447] [448] [449] According to the applicant, this requires an emergency escharotomy involving incising through areas of burnt skin to release the eschar and its constrictive effects, restore distal circulation, and allow adequate ventilation. The applicant claimed that reducing the need for an escharotomy also reduces the need for subsequent surgical reconstruction of the escharotomy wound, and potential complications, including uncontrolled bleeding, incomplete release, damage to deep structures, functional deficits, and scarring.

To support the claim that NexoBrid™ reduces the time to eschar removal, the applicant asserted that NexoBrid™ has been shown in the two phase 3 multi-center, randomized-controlled trials to have a lower average time of eschar removal compared to the standard of

care, with the DETECT study demonstrating 1.0 day eschar removal versus 3.8 days and NCT00324311 demonstrating 2.2 days versus 8.7 days (p<0.0001) for treated and control groups respectively.[450]

The applicant also included a systematic review and meta-analysis of clostridial collagenase ointment (CCO) studies by Pham, C. H., et al. to support its claim of decreased eschar removal time as compared to existing non-surgical therapies.[451] Per the study, the reported average time to clean wound bed (complete eschar removal) for CCO ranged from 6 days to 9.3 days with daily dressing changes among the prospective studies included in the systematic review. We note that the literature review was limited to the efficacy and use of CCO in burn patients and did not discuss other standard of care therapies.

The applicant asserted that the use of NexoBrid™ can lead to decreased need for surgical excision. The applicant stated that in a pooled analysis of both Phase 3 clinical trials, NexoBrid™ exhibited lower incidence of surgical excision to complete eschar removal (26.9% vs 70.6%), lower mean percent wound area surgically excised (11.5% vs 55.1%), and a higher rate of complete eschar removal without rescue surgical excision (90.5% vs 70.1%) compared to standard of care. The applicant cited these results as proof of the tissue-sparing effects compared with standard of care. The applicant further stated that the NCT00324311 study [452] showed that among patients with wounds comprised entirely of deep partial thickness (DPT) burns in this study, the incidence of excision or dermabrasion after debridement was statistically significantly lower with NexoBrid™ compared with standard of care (15.1% vs 65.5%, p<0.0001), and that the mean percent wound area excised was also statistically significantly lower with NexoBrid™, 14.6% versus 44.5% in standard of care group (p <0.0001). The applicant stated that in the DETECT study, the incidence of complete eschar removal in the NexoBrid™ group was 93.35% (70 of 75 patients) versus 100% in the standard of care group (which included both surgical and non-surgical debridement) versus 4.0% in the gel vehicle placebo group. The applicant stated that the incidence of excision to complete eschar removal was statistically significantly lower with NexoBrid™, 4.0% versus 72% for the standard of care group (p<0.0001).

The applicant asserted that the shorter time to complete eschar removal for patients treated with NexoBrid™ has been shown to be associated with effective prevention of the subsequent need for autografting. The applicant stated that in the first published Phase 3 pivotal clinical trial NCT00324311,[453] the autograft rate was 17.9% in the NexoBrid™ treated arm vs. 34.1% in the standard of care treated group (p=0.009), and the percentage of wound autografted was lower in the NexoBrid™ group, 8.4% vs. 21.5% in the standard of care group (p=0.0054). The applicant further stated that among patients with at least one wound that was entirely a DPT burn, significantly fewer wound autografts were performed in the NexoBrid™ group, 17.9% (19/106 wounds) versus 34% (30/88 wounds) in the standard of care group (p=0.0099), and the percent treated wound area autografted was also significantly lower in the NexoBrid™ group, 8.4% versus 21.5% in the standard of care group (p=0.0054).

The applicant also stated that a prospective single-arm study of NexoBrid™ showed that 25 patients with partial thickness burns who were treated with NexoBrid™ experienced a reduction in the need for autografting compared to patients treated with standard of care.[454]

The applicant also cited studies comparing NexoBrid™ to surgical debridement in hand and facial burns. The applicant stated that a single center controlled study of 40 hand burns demonstrated a reduced need for autografting with NexoBrid™, with 15% of patients receiving NexoBrid™ compared to 95% of patients treated with the standard of care (excisional surgical debridement) requiring autografting (p=0.034).[455] The single center controlled study of 26 face burns demonstrated a reduced need for autografting with NexoBrid®, with 15% of patients receiving NexoBrid™ compared to 77% of patients treated with the standard of care requiring autografting (p=−0.002).[456]

The applicant asserted that because the use of NexoBrid™ reduces areas that require autografting, this results in decreased donor site morbidity, which is particularly useful for patients with limited donor site area (example, high total body surface area burns), or risk factors for delayed wound healing (example, advanced age).[457] [458]

Per the applicant, by selectively debriding only non-viable tissue, NexoBrid™ reduces the area of burn that requires autografting compared to surgical excision and other non-surgical approaches of eschar debridement. Per the applicant, NexoBrid™'s selective debridement of non-viable tissue is especially useful in delicate areas such as face,[459] hands,[460] [461] feet, and genitals which are difficult areas to excise eschar surgically.[462] [463] The applicant also claimed that the use of NexoBrid™ results in decreased scarring from the reduced need for autografting.

The applicant asserted that the two single-center controlled trials discussed in this section, one of patients with hand burns[464] and one of patients with

facial burns,[465] demonstrated that cosmesis of the healed wound using NexoBrid™ was comparable if not better than traditional surgical debridement (standard of care arm). In addition, per the applicant, a single arm prospective study of 36 patients showed that only 11.1% of patients treated with NexoBrid™ developed hypertrophic scars.[466]

In further support of their statements suggesting that the use of NexoBrid™ results in reduced time to complete debridement, reduced need for surgery, and reduced need for autografting, the applicant submitted a literature review that identified studies published between 2012 and 2017 involving the use of NexoBrid™ in deep partial and full thickness burns.[467] In this article, studies were evaluated for proposed benefits of NexoBrid™ and categorized under supporting evidence, contradicting evidence, and anecdotal opinions. Seven prospective studies met the inclusion criteria including four randomized controlled trials. Six proposed benefits associated with the use of NexoBrid™ were extracted from the studies including reduced time to complete debridement, need for surgery, area of burns excised, need for autograft, time to wound closure, and improved scar quality. The authors of the literature review stated that most of the proposed benefits had strong supporting evidence from controlled trials as well as some anecdotal data. The authors further stated that for the proposed benefits of scar quality improvement and reduced time to wound healing, three sources and one anecdotal study provided refuting evidence. Incidence of pain was also evaluated and was mainly anecdotal, lacking formal objective assessment or cohort study.[468]

Regarding the substantial clinical improvement criterion, we have the following concerns. We note that the applicant's claims of superiority of NexoBrid™ to standard of care debridement methods are non-specific because the studies cited were not designed to compare NexoBrid™ to a specific non-surgical method or an enzymatic debridement product. In addition, we are unclear whether comparing NexoBrid™ to a surgical treatment modality is the most appropriate comparator since mechanical means of debridement have different clinical indications, risks, and benefits compared to enzymatic debridement. We note that studies also did not demonstrate that NexoBrid™ selectively debrides eschar and does not injure viable skin. In addition, it may be difficult to generalize across studies of NexoBrid™ because the wound care and timing of the debridement and subsequent autografting varies across different burn centers and studies. We note that we are unable to verify the results of the DETECT study as it does not appear that this data has been published or provided by the applicant. Finally, we note that a review of seven studies of NexoBrid™ [469] observed that when compared to the standard of care, there were variable reports of the cosmetic outcome of NexoBrid™, prolonged wound closure, longer lengths of stay, and significant pain associated with NexoBrid™ eschar debridement.

We invite public comment on whether NexoBrid™ meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for the NexoBrid™.

m. Olumiant® (baricitinib)

Eli Lilly and Company submitted an application for new technology add-on payments for Olumiant® (baricitinib) for FY 2022. Olumiant® is a Janus kinase (JAK) 1 and 2 inhibitor used in combination with remdesivir as a treatment option for coronavirus disease 2019 (COVID–19), a respiratory disease caused by severe acute respiratory syndrome coronavirus 2 (SARS–CoV–2). Olumiant® has not yet received marketing approval from FDA to treat COVID–19, but has received an emergency use authorization (EUA) by the FDA. Olumiant® has been previously approved by FDA for the treatment of adult patients with moderately to severely active rheumatoid arthritis, who have had inadequate response to one or more tumor necrosis factor (TNF) antagonist therapies.[470]

The applicant stated that patients diagnosed with COVID–19 are at an elevated risk for excess morbidity and mortality due to the underlying SARS-CoV–2 infection and subsequent cytokine activation. The applicant stated that the cause of respiratory failure in COVID–19 is a hyperinflammatory state characterized by upregulation of multiple cytokines and that Olumiant® may be a viable treatment in patients with COVID–19 requiring supplemental oxygen, invasive mechanical ventilation, or extracorporeal membrane oxygenation (ECMO) because of its anti-inflammatory activity and ability to reverse dysregulated inflammatory markers in patients with COVID–19.[471] The applicant noted treatment with baricitinib 4 mg resulted in reduced plasma levels of the cytokine IL–6 in hospitalized patients with COVID–19, a finding that was replicated after being observed in patients with rheumatoid arthritis.[472] [473] [474] The applicant also claimed that Olumiant® potentially has anti-viral activity in inhibiting SARS-CoV–2 from entering and infecting lung cells due to its affinity for adaptor-associated kinase-1 (AAK1).[475] The applicant noted that there are ongoing

studies to evaluate the impact of the antiviral host activity of Olumiant®.

With respect to the newness criterion, Olumiant® received Emergency Use Authorization (EUA) from FDA on November 19, 2020 for the emergency use of Olumiant®, indicated for use in combination with remdesivir for the treatment of suspected or laboratory confirmed COVID–19 in certain hospitalized patients requiring supplemental oxygen, invasive mechanical ventilation, or extracorporeal membrane oxygenation (ECMO). The applicant stated that it intends to submit a supplemental new drug application (sNDA) for Olumiant®.

In the FY 2009 IPPS final rule (73 FR 48561 through 48563), we revised our regulations at § 412.87 to codify our longstanding practice of how CMS evaluates the eligibility criteria for new medical service or technology add-on payment applications. We stated that new technologies that have not received FDA approval do not meet the newness criterion. In addition, we stated we do not believe it is appropriate for CMS to determine whether a medical service or technology represents a substantial clinical improvement over existing technologies before the FDA makes a determination as to whether the medical service or technology is safe and effective. For these reasons, we first determine whether a new technology meets the newness criterion, and only if so, do we make a determination as to whether the technology meets the cost threshold and represents a substantial clinical improvement over existing medical services or technologies. We also finalized at 42 CFR 412.87(c) (subsequently redesignated as 412.87(e)) that all applicants for new technology add-on payments must have FDA approval or clearance by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered.

In the FY 2021 IPPS/LTCH PPS final rule, to more precisely describe the various types of FDA approvals, clearances, licensures, and classifications that we consider under our new technology add-on payment policy, we finalized a technical clarification to § 412.87(e)(2) to indicate that new technologies must receive FDA marketing authorization (for example, pre-market approval (PMA); 510(k) clearance; the granting of a De Novo classification request; approval of a New Drug Application (NDA); or Biologics License Application (BLA) licensure) by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. As noted in the FY 2021 IPPS/LTCH PPS final rule, this technical clarification did not change our longstanding policy for evaluating whether a technology is eligible for new technology add-on payment for a given fiscal year, and we continue to consider FDA marketing authorization as representing that a product has received FDA approval or clearance for purposes of eligibility for the new technology add-on payment under § 412.87(e)(2) (85 FR 58742).

An EUA by the FDA allows a product to be used for emergency use, but under our longstanding policy, we believe it would not be considered an FDA marketing authorization for the purpose of new technology add-on payments, as a product that is available only through an EUA is not considered to have FDA approval or clearance. Therefore, under the current regulations at 42 CFR 412.87(e)(2) and consistent with our longstanding policy of not considering eligibility for new technology add-on payments prior to a product receiving FDA approval or clearance, we believe a product available only through an EUA would not be eligible for new technology add-on payments.

We also refer the reader to our comment solicitation in section II.F.7 of the preamble of this proposed rule regarding how data reflecting the costs of a product with an EUA, which may become available upon authorization of the product for emergency use (but prior to FDA approval or clearance), should be considered for purposes of the 2-year to 3-year period of newness for new technology add-on payments for a product with or expected to receive an EUA, including whether the newness period should begin with the date of the EUA. With respect to Olumiant®, we are specifically requesting comment on whether the newness period for this technology would begin on November 19, 2020, the date of its EUA, when the product became available on the market.

In response to the COVID–19 public health emergency (PHE), we established the New COVID–19 Treatments Add-on Payment (NCTAP) under the IPPS for COVID–19 cases that meet certain criteria (85 FR 71155). We believe that as drugs and biological products become available and are authorized for emergency use or approved by FDA for the treatment of COVID–19 in the inpatient setting, it is appropriate to increase the current IPPS payment amounts to mitigate any potential financial disincentives for hospitals to provide new COVID–19 treatments during the PHE. Therefore, effective for discharges occurring on or after November 2, 2020 and until the end of the PHE for COVID–19, we established the NCTAP to pay hospitals the lesser of (1) 65 percent of the operating outlier threshold for the claim or (2) 65 percent of the amount by which the costs of the case exceed the standard DRG payment, including the adjustment to the relative weight under section 3710 of the Coronavirus Aid, Relief, and Economic Security (CARES) Act, for certain cases that include the use of a drug or biological product currently authorized for emergency use or approved for treating COVID–19.[476] Qualifying inpatient cases involving the use of Olumiant®, in combination with VEKLURY®, are currently eligible for NCTAP beginning November 19, 2020, the date Olumiant® received EUA, through the end of the PHE.

We anticipate that there might be inpatient cases of COVID–19, beyond the end of the PHE, for which payment based on the assigned MS–DRG may not adequately reflect the additional cost of new COVID–19 treatments. In order to continue to mitigate potential financial disincentives for hospitals to provide new treatments, and to minimize any potential payment disruption immediately following the end of the PHE, we believe that the NCTAP should remain available for cases involving eligible treatments, including Olumiant®, in combination with VEKLURY®, for the remainder of the fiscal year in which the PHE ends (for example, until September 30, 2022). We refer the reader to our proposal in section II.F.8. of the preamble of this proposed rule to extend the NCTAP through the end of the fiscal year in which the PHE ends for certain products and discontinue the NCTAP for products approved for new technology add-on payments in FY 2022.

The applicant indicated that Olumiant® could be reported using the ICD–10–PCS codes 3E0DXGC (Introduction of other therapeutic substance into mouth and pharynx, external approach) or 3E0G7GC (Introduction of other therapeutic substance into upper GI, via natural or artificial opening) but stated that these codes do not uniquely identify the administration of Olumiant®. We note that ICD–10–PCS codes XW0DXF5 (Introduction of other new technology therapeutic substance into mouth and pharynx, external approach, new technology group 5) and 3E0H7GC (Introduction of other therapeutic

[476] Additional Policy and Regulatory Revisions in Response to the COVID–19 Public Health Emergency, 85 FR 71142, 71155 (November 6, 2020). *https://www.govinfo.gov/content/pkg/FR-2020-11-06/pdf/2020-24332.pdf.*; For more information on NCTAP, refer to CMS' provider toolkit at *https://www.cms.gov/medicare/covid-19/new-covid-19-treatments-add-payment-nctap.*

substance into lower G.I. via natural or artificial opening) could also be used to report use of Olumiant®. We note that as of January 1, 2021, Olumiant® is uniquely identified by ICD–10–PCS codes XW0DXM6 (Introduction of baricitinib into mouth and pharynx, external approach, new technology group 6), XW0G7M6 (Introduction of baricitinib into upper GI, via natural or artificial opening, new technology group 6), and XW0H7M6 (Introduction of baricitinib into lower GI, via natural or artificial opening, new technology group 6).

As discussed previously, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With respect to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, according to the applicant, Olumiant® does not use the same or a similar mechanism of action when compared to an existing technology to achieve a therapeutic outcome, as there are no JAK inhibitor therapies that have received an EUA or an approval from FDA to treat COVID–19.

The applicant notes that currently there is one therapy approved by FDA to treat COVID–19 in hospital inpatients, remdesivir, and one therapy, besides Olumiant®, that has received EUA for the treatment of COVID–19, convalescent plasma.[477] The applicant claims that the mechanism of action for both of these treatments differs from Olumiant®, which works as a JAK inhibitor.

With respect to the second criterion, whether a product is assigned to the same or a different MS–DRG, the applicant stated that there are no JAK inhibitor therapies that have received an EUA or an approval from FDA for the treatment of patients with COVID–19 and that Olumiant® could therefore not be assigned to the same MS–DRG as existing technologies.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, according to the applicant, Olumiant® represents a potential new treatment option for adult and pediatric patients 2 years or older with suspected or laboratory-confirmed COVID–19 requiring supplemental oxygen, invasive mechanical ventilation, or extracorporeal membrane oxygenation (ECMO). The applicant also stated that COVID–19 is an entirely distinct disease from those caused by other coronaviruses including severe acute respiratory syndrome (SARS) and the Middle East respiratory syndrome coronavirus (MERS–CoV).

In summary, the applicant asserted that Olumiant® is not substantially similar to other available therapies because, as a JAK inhibitor, it has a unique mechanism of action; there are no other products assigned to the same MS–DRG; and it treats a different patient population and disease—COVID–19. However, although there may not be any other JAK inhibitors for the treatment of COVID–19 assigned to the same MS–DRG as Olumiant®, we note that Olumiant® may map to the same MS–DRG as other existing COVID–19 treatments. We also note that Olumiant® involves the treatment of the same patient population and disease as other treatments for COVID–19, as Olumiant® is given to the same patients as remdesivir due to the EUA indication.

As discussed in section II.F.7 of the preamble, we are requesting comment regarding how data reflecting the costs of a product with an EUA, which may become available upon authorization of the product for emergency use (but prior to FDA approval or clearance), should be considered for purposes of the 2-year to 3-year period of newness for new technology add-on payments for a product with or expected to receive an EUA, including whether the newness period should begin with the date of the EUA. We are also specifically requesting comment on whether the newness period for Olumiant® would begin on November 19, 2020, the date of its EUA, when the product became available on the market.

As previously discussed, under the regulations at 42 CFR 412.87(e)(2) and consistent with our longstanding policy of not considering eligibility for new technology add-on payments prior to a product receiving FDA approval or clearance, we believe a product available only through an EUA would not be eligible for new technology add-on payments.

We are inviting public comment on whether Olumiant® meets the newness criterion.

With respect to the cost criterion, the applicant performed four analyses. Two of these analyses were based on proxy COVID–19 cases using ICD–10–CM B97.29 with additional coding to identify manifestation. The applicant stated that these cases were then differentiated into proxy COVID–19 cases with supplemental oxygen and all proxy COVID–19 cases. The applicant stated that they also conducted two supplemental analyses to confirm that actual COVID–19 cases using Olumiant® would meet the cost threshold using linked 837 and 835 inpatient Electronic Data Interchange (EDI) transaction sets that were processed during February through June of 2020. The applicant then identified COVID–19 cases with supplemental oxygen and all COVID–19 cases.

For the first analysis, the applicant searched the FY 2019 MedPAR LDS claims data file for potential cases representing patients who may be eligible for treatment using Olumiant®. The applicant identified proxy COVID–19 cases with supplemental oxygen by using ICD–10–CM diagnosis code B97.29 with one of the following ICD–10–CM codes: J12.89, J20.8, J40, J22, J98.8, and J80. The applicant excluded ICD–10–CM codes B34.2 and Z03.818. The applicant stated that this coding methodology was based on CDC guidance for coding COVID–19 cases prior to April 1, 2020. The applicant then limited the group to those cases that had ICD–10–PCS codes for supplemental oxygen. The ICD–10–PCS codes included ventilation (5A1935Z, 5A1945Z, 5A1955Z, 5A09357, 5A09358, 5A09359, 5A0935B, 5A0935Z, 5A09457, 5A09458, 5A09459, 5A0945B, 5A0945Z, 5A09557, 5A09558, 5A09559, 5A0955B, and 5A0955Z), extracorporeal membrane oxygenation (5A15223, 5A1522F, 5A1522G, 5A1522H, 5A15A2F, 5A15A2G, and 5A15A2H), and ICD–10–CM code Z99.81. This resulted in 473 cases mapping to the 11 MS–DRGs listed below.

[477] The Federal Drug and Food Administration. Emergency Use Authorizations: Drug and Biological Products. 2020. *https://www.fda.gov/emergency-preparedness-andresponse/mcm-legal-regulatory-and-policy-framework/emergency-useauthorization#coviddrugs.*

MSDRGs - Proxy COVID-19 with Supplemental Oxygen	
MS-DRG	**Description**
871	Septicemia or Severe Sepsis w/o Mv >96 Hours w MCC
189	Pulmonary Edema & Respiratory Failure
193	Simple Pneumonia & Pleurisy w MCC
190	Chronic Obstructive Pulmonary Disease w MCC
208	Respiratory System Diagnosis w Ventilator Support <=96 Hours
870	Septicemia or Severe Sepsis w MV >96 Hours or Peripheral Extracorporea
291	Heart Failure & Shock w MCC or Peripheral Extracorporeal Membrane Oxyg
207	Respiratory System Diagnosis w Ventilator Support >96 Hours or Periphe
202	Bronchitis & Asthma w CC/MCC
177	Respiratory Infections & Inflammations w MCC
194	Simple Pneumonia & Pleurisy w CC

For the second analysis, the applicant identified all proxy COVID–19 cases using the same ICD–10–CM codes that were previously described; however, the applicant did not include or exclude any cases based on the ICD–10–PCS codes listed in claims. This resulted in 1,726 cases mapping to the following 25 MS–DRGs.

MSDRGs - All Proxy COVID-19	
MS-DRG	**Description**
871	Septicemia or Severe Sepsis w/o Mv >96 Hours w MCC
193	Simple Pneumonia & Pleurisy w MCC
202	Bronchitis & Asthma w CC/MCC
189	Pulmonary Edema & Respiratory Failure
190	Chronic Obstructive Pulmonary Disease w MCC
291	Heart Failure & Shock w MCC or Peripheral Extracorporeal Membrane Oxygen
194	Simple Pneumonia & Pleurisy w CC
191	Chronic Obstructive Pulmonary Disease w CC
208	Respiratory System Diagnosis w Ventilator Support <=96 Hours
870	Septicemia or Severe Sepsis w MV >96 Hours or Peripheral Extracorporea
177	Respiratory Infections & Inflammations w MCC
872	Septicemia or Severe Sepsis w/o MV >96 Hours w/o MCC
853	Infectious & Parasitic Diseases w O.R. Procedure w MCC
195	Simple Pneumonia & Pleurisy w/o CC/MCC
207	Respiratory System Diagnosis w Ventilator Support >96 Hours or Periphe
166	Other Resp System O.R. Procedures w MCC
203	Bronchitis & Asthma w/o CC/MCC
205	Other Respiratory System Diagnoses w MCC
682	Renal Failure w MCC
308	Cardiac Arrhythmia & Conduction Disorders w MCC
192	Chronic Obstructive Pulmonary Disease w/o CC/MCC
292	Heart Failure & Shock w CC
178	Respiratory Infections & Inflammations w CC
698	Other Kidney & Urinary Tract Diagnoses w MCC
280	Acute Myocardial Infarction, Discharged Alive w MCC

For the third analysis, the applicant used Inovalon provider-sourced pre- and post-adjudicated claims data to identify CY 2020 claims for COVID–19 cases that may be eligible for treatment involving Olumiant®. Specifically, the applicant used linked 837 and 835 inpatient Electronic Data Interchange (EDI) transaction sets that were processed between February and June of 2020. For discharges prior to April 1, 2020, the applicant identified cases using ICD–10–CM diagnosis code B97.29 with one of the following ICD–10–CM codes: J12.89, J20.8, J40, J22, J98.8, and J80. The applicant excluded ICD–10–CM codes B34.2 and Z03.818. For cases discharged on or after April 1, 2020, the applicant identified cases using ICD–10–CM code U07.1 and excluded codes B34.2 and Z03.818. The applicant then limited the group to those cases that had ICD–10–PCS codes for supplemental oxygen. The ICD–10–PCS codes included ventilation (5A1935Z, 5A1945Z, 5A1955Z, 5A09357, 5A09358, 5A09359, 5A0935B, 5A0935Z, 5A09457, 5A09458, 5A09459, 5A0945B, 5A0945Z, 5A09557, 5A09558, 5A09559, 5A0955B, and 5A0955Z) and extracorporeal membrane oxygenation (5A15223, 5A1522F, 5A1522G, 5A1522H, 5A15A2F, 5A15A2G, and 5A15A2H), and ICD–10–CM code Z99.81 Dependence on supplemental oxygen. This resulted in 966 cases, which were mapped to the following 7 MS–DRGs:

MSDRGs - COVID-19 with Supplemental Oxygen	
MS-DRG	**Description**
870	Septicemia or Severe Sepsis W MV >96 Hours or Peripheral Extracorporea
871	Septicemia or Severe Sepsis w/o MV >96 Hours w MCC
207	Respiratory System Diagnosis w Ventilator Support >96 Hours or Periphe
177	Respiratory Infections & Inflammations w MCC
208	Respiratory System Diagnosis w Ventilator Support <=96 Hours
004	Tracheostomy w MV >96 Hours or Principal Diagnosis Except Face, Mouth and Neck w/o Major O.R
853	Infectious & Parasitic Diseases w O.R. Procedure w MCC

For the fourth analysis, the applicant identified all COVID–19 cases using the same ICD–10–CM diagnosis codes as previously described. For discharges prior to April 1, 2020, the applicant identified cases using ICD–10–CM diagnosis code B97.29 with one of the following ICD–10–CM codes: J12.89, J20.8, J40, J22, J98.8, and J80. The applicant excluded ICD–10–CM codes B34.2 and Z03.818. For cases discharged on or after April 1, 2020, the applicant identified cases using ICD–10–CM code U07.1 and excluded codes B34.2 and Z03.818. The applicant did not include or exclude any cases based on the ICD–10–PCS codes listed in claims. Based on this analysis, the applicant found 3,826 cases, which map to 21 MS–DRGs listed below.

MSDRGs – All COVID-19	
MS-DRG	**Description**
177	Respiratory Infections & Inflammations w MCC
871	Septicemia or Severe Sepsis w/o MVv >96 hours w MCC
870	Septicemia or Severe Sepsis w MV >96 Hours or Peripheral Extracorporea
207	Respiratory System Diagnosis w Ventilator Support >96 Hours or Periphe
178	Respiratory Infections & Inflammations w CC
208	Respiratory System Diagnosis w Ventilator Support <=96 Hours
193	Simple Pneumonia & Pleurisy w MCC
179	Respiratory Infections And Inflammations w/o CC/MCC
004	Tracheostomy w MV >96 Hours or Principal Diagnosis Except Face, Mouth And Neck w/o Major O.R
194	Simple Pneumonia & Pleurisy w CC
853	Infectious & Parasitic Diseases w O.R. Procedure w MCC
377	Gastrointestinal Hemorrhage w MCC
640	Miscellaneous Disorders Of Nutrition, Metabolism, Fluids and Electrolytes w MCC
682	Renal Failure w MCC
981	Extensive O.R. Procedure Unrelated to Principal Diagnosis w MCC
291	Heart Failure & Shock w MCC or Peripheral Extracorporeal Membrane Oxyg
480	Hip And Femur Procedures Except Major Joint w MCC
637	Diabetes w MCC
689	Kidney And Urinary Tract Infections w MCC
195	Simple Pneumonia & Pleurisy w/o CC/MCC
698	Other Kidney & Urinary Tract Diagnoses w MCC

For each analysis, the applicant then removed 12.5 percent of the length of stay charges from the relevant cases to estimate the reduction in charges due to decrease in number of hospitalization days that may be avoided through use of baricitinib. The applicant determined this percentage based on findings from the ACTT–2 trial,[478] sponsored by the National Institute of Allergy and Infection Diseases (NIAID), which found an improved median time to recovery from 8 to 7 days (that is, a 12.5 percent improvement).

For the first two analyses, the applicant then standardized the charges and applied a 2-year inflation factor of 1.131096 that the applicant stated was used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges. We note that the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges is 1.13218, which would have increased the inflated charges figure. For analysis three and four, the applicant standardized the charges and applied a one-year inflation factor of 6.4 percent, the one-year inflation factor published in the FY 2021 IPPS/LTCH PPS final rule.

For each analysis, the applicant then calculated and added the charges for Olumiant® by taking the estimated per patient cost of the drug, and converting it to a charge by dividing the costs by the national average CCR (cost-to-charge ratio) of 0.187 for drugs from the FY 2021 IPPS/LTCH PPS final rule (85 FR 58601).

In the first analysis, which included proxy COVID–19 with supplemental oxygen cases, the applicant computed a final inflated average case-weighted standardized charge per case of $88,728, which exceeded the average case-weighted threshold amount of $69,276.

In the second analysis, which included all proxy COVID–19 cases, the applicant computed a final inflated average case-weighted standardized charge per case of $68,562, which exceeded the average case-weighted threshold amount of $56,643.

In the third analysis, which included COVID–19 with supplemental oxygen cases, the applicant computed a final inflated average case-weighted

[478] Kalil, A.C., Patterson, T.F., Mehta, A.K., et al. Baricitinib plus remdesivir for adults with Covid-19. (2020). *New England Journal of Medicine.* DOI: 10.1056/NEJMoa2031994

standardized charge per case of $198,114, which exceeded the average case-weighted threshold amount of $123,238.

In the fourth analysis, which included all COVID–19 cases, the applicant computed a final inflated average case-weighted standardized charge per case of $99,870, which exceeded the average case-weighted threshold amount of $75,891.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount under both analyses described previously, the applicant asserted that the technology meets the cost criterion.

We invite public comments on whether Olumiant® meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that Olumiant® in combination with remdesivir represents a substantial clinical improvement over existing technologies because it improves time to recovery, improves the odds of improvement in clinical status at Day 15 after enrollment, and reduces mortality in the treatment of COVID–19 compared to remdesivir alone.[479] The applicant also stated that the combination of Olumiant® and remdesivir has a favorable risk/benefit profile in comparison to remdesivir alone. The applicant also claimed that Olumiant® improves respiratory function in patients treated with corticosteroids for SARS-CoV–2 pneumonia when compared with corticosteroids alone.

In support of these claims, the applicant submitted the results of the Adaptive COVID–19 Treatment Trial (ACTT–2)[480] which was a randomized, double-blind, placebo-controlled clinical trial sponsored by the National Institute of Allergy and Infectious Diseases (NIAID), part of the National Institutes of Health (NIH). The ACTT–2 trial included 1,033 hospitalized patients with COVID–19 and assessed whether the combination of Olumiant® plus remdesivir was superior to remdesivir + placebo. There were 515 patients randomized to the treatment group and 518 to the control group. Of those in the treatment group, 507 (98.4 percent) received treatment as assigned. Of those in the control group, 509 (98.3 percent) received treatment as assigned. A total of 498 patients in the treatment group and 495 in the control group completed the trial through day 29, recovered, or died. The mean age of the patients was 55.4 years, and 63.1 percent were male. An ordinal scale was used in the study that identified the patient's baseline disease severity at enrollment and ranged from 1 (not hospitalized, no limitations on activities) to 8 (death). This scale is displayed in the table below. The intention-to-treat population included 706 patients with moderate disease (ordinal score of 4 [hospitalized, not requiring supplemental oxygen—requiring ongoing medical care] or 5 [hospitalized, requiring supplemental oxygen]) and 327 with severe disease (ordinal score of 6 [hospitalized, on non-invasive ventilation or high flow oxygen devices] or 7 [hospitalized, on mechanical ventilation or ECMO]). Patients received remdesivir intravenously as a 200-mg loading dose on day 1, followed by a 100-mg maintenance dose administered daily on days 2 through 10 or until hospital discharge or death. Baricitinib was administered as a 4-mg daily dose (either orally [two 2-mg tablets] or through a nasogastric tube) for 14 days or until hospital discharge.

Baseline Disease Severity Ordinal Scale	
1	Not hospitalized, no limitations on activities
2	Not hospitalized, limitation on activities and/or requiring home oxygen
3	Hospitalized, not requiring supplemental oxygen – no longer requires ongoing medical care
4	Hospitalized, not requiring supplemental oxygen – requiring ongoing medical care
5	Hospitalized, requiring supplemental oxygen
6	Hospitalized, on non-invasive ventilation or high flow oxygen devices
7	Hospitalized, on mechanical ventilation or ECMO
8	Death

In support of its claim that Olumiant® in combination with remdesivir improves time to recovery from COVID–19 compared to remdesivir alone, the applicant cited the primary outcome of the ACTT–2 study, which showed that the median time to recovery for the Olumiant® plus remdesivir (treatment) group was 7 days and the median time to recovery for remdesivir plus placebo (control) group was 8 days (rate ratio for recovery, 1.16 (1.01–1.32); p=0.03). Recovery was defined as the participant being well enough for hospital discharge, meaning the participant either no longer required supplemental oxygen or ongoing medical care in the hospital, or was no longer hospitalized at Day 29.

The applicant also stated that the median time to recovery among patients receiving noninvasive ventilation or high-flow oxygen (baseline ordinal score of 6) was 10 days for the treatment group and 18 days in the control group (rate ratio for recovery, 1.51; 95 percent CI, 1.10–2.08). The applicant stated that the median time to recovery was one day shorter among patients receiving supplemental oxygen (baseline ordinal score of 5) in the Olumiant® and remdesivir group (5 days vs. 6 days) rate ratio 1.17; CI, 0.98–1.39). The applicant noted that for those receiving mechanical ventilation or ECMO at enrollment (baseline ordinal score of 7), the rate ratio for recovery was 1.08 (95 percent CI, 0.59 to 1.97).

The applicant asserted that the secondary outcome of the ACTT–2 study supports its claim of improved odds of improvement in clinical status at Day 15 based on the eight-category ordinal scale. The applicant summarized the results of the study which showed that the odds of improvement in clinical status at Day 15 were greater in the Olumiant® group compared to the placebo group (odds ratio 1.3; 95 percent CI, 1.0–1.6). The applicant also stated that the odds of

[479] Kalil, A.C., Patterson, T.F., Mehta, A.K., et al. Baricitinib plus remdesivir for adults with Covid–19. (2020). *New England Journal of Medicine.* DOI: 10.1056/NEJMoa2031994.

[480] Ibid.

improvement in clinical status at Day 15 were greater for patients receiving noninvasive ventilation or high-flow oxygen (baseline ordinal score of 6) in the Olumiant® group versus the control group (odds ratio 2.2; 95 percent CI, 1.4–3.6).

The applicant asserted that the study conducted by Kalil et al. (2020) supports its claim of reduced mortality in the Olumiant® and remdesivir group compared to the control group because the Kaplan-Meier estimates of mortality at day 28 after randomization were 5.1 percent (95 percent CI, 3.5–7.6) in the combination (Olumiant® and remdesivir) group and 7.8 percent (95 percent CI, 5.7 to 10.6) in the control group (hazard ratio for death, 0.65; 95 percent CI, 0.39 to 1.09). The applicant also stated that the greatest numerical differences in mortality between patients in the combination group and those in the control group were observed among those with a baseline ordinal score of 5 (1.9 percent vs. 4.7 percent; hazard ratio, 0.40; 95 percent CI, 0.14 to 1.14) or 6 (7.5 percent vs. 12.9 percent; hazard ratio, 0.55; 95 percent CI, 0.22 to 1.38). The applicant also cited the Kaplan–Meier estimates of mortality at 14 days after randomization, which were 1.6 percent in the combination group and 3.0 percent in the control group (hazard ratio, 0.54; 95 percent CI, 0.23 to 1.28).

The applicant also asserted that the incidence of new use of oxygen was lower in patients treated with Olumiant® in combination with remdesivir compared to remdesivir alone (22.9 percent vs. 40.3 percent respectively; difference, −17.4 percentage points; 95 percent CI, −31.6 to −2.1) and that the incidence of new use of mechanical ventilation or ECMO was lower in the combination group (10.0 percent vs. 15.2 percent; difference, −5.2 percentage points; 95 percent CI, −9.5 to −0.9) based on Kalil et al. (2020). The applicant also stated that there were fewer median days of receipt of mechanical ventilation or ECMO among the 128 patients for which these interventions were started after enrollment or who died with no observed new use in the Olumiant® in combination with remdesivir group compared to the remdesivir group (16 median days in the combination group and 27 median days in the control group (difference, −11.0; 95 percent CI, −18.3 to −3.7)). The applicant also stated that the incidence of progression to death or noninvasive or invasive ventilation was lower in the combination group than in the control group (22.5 percent vs. 28.4 percent; rate ratio, 0.77; 95 percent CI, 0.60 to 0.98) and that the incidence of progression to death or invasive ventilation was also lower (12.2 percent vs. 17.2 percent; rate ratio, 0.69; 95 percent CI, 0.50 to 0.95).

The applicant asserted that the study conducted by Kalil et al. (2020) supports its claim that the combination of Olumiant® in combination with remdesivir has a favorable benefit/risk profile compared to remdesivir alone. The applicant states that serious adverse events occurred in 81 patients (16.0 percent) in the combination group (six of these were thought to be related to the trial product) and in 107 patients (21.0 percent) in the control group (five of these were thought to be related to the trial product) and the between-group difference was −5.0 percentage points (95 percent CI, −9.8 to −0.3; P = 0.03). The applicant also states that Grade 3 or 4 adverse events occurred in 207 patients (40.7 percent) in the combination group and 238 (46.8 percent) in the control group.

The applicant also cited an observational study [481] to support the claim that there was greater improvement in pulmonary function in patients receiving lopinavir/ritonavir and hydroxychloroquine with Olumiant® and corticosteroids when compared to patients receiving lopinavir/ritonavir and hydroxychloroquine with corticosteroids alone. In this study, the primary end point was the change in oxygen saturation as measured by pulse oximetry (SpO2)/FiO2 from hospitalization to discharge. The applicant stated that there was a greater improvement in SpO2/FiO2 from hospitalization to discharge observed in the Olumiant® in combination with corticosteriods versus the corticosteroids alone group (mean differences adjusted for IPSW, 49; 95 percent CI: 22, 77; p<0.001).

In our assessment of the applicant's claims in support of substantial clinical improvement, we have the following concerns. With regard to the ACTT–2 trial, we note that there were no statistically significant differences in time to recovery or odds of improvement in clinical status at Day 15 between the Olumiant®+remdesivir group compared to the remdesivir+placebo group for patients with a baseline ordinal score of 4, 5, or 7. We further note that although the applicant asserted that Olumiant®+remdesivir reduces mortality compared to remdesivir alone, the difference between the treatment and control groups was not statistically significant. We also note that the ACTT–2 study protocol prohibited the use of systemic corticosteroids for the treatment of COVID–19 but allowed systemic steroids for standard indications such as asthma exacerbation, acute respiratory distress syndrome (ARDS), chronic obstructive pulmonary disease (COPD), laryngeal edema, adrenal insufficiency and shock [482] and we are therefore unsure if the use of corticosteroids among the patient population may be a confounding factor. With regard to the Rodriguez-Garcia (2020) study, we note that this study did not involve the treatment of patients with Olumiant® in combination with remdesivir, which is the authorized use per its EUA, and the use of multiple treatments in this trial may make the effect of Olumiant® on greater improvement in pulmonary function unclear. Finally, we note that the current clinical guidelines from the Infectious Diseases Society of America (IDSA) recommend the use of Olumiant® with remdesivir rather than remdesivir alone among hospitalized patients with severe COVID–19 who cannot receive corticosteroids because of a contraindication.[483] In addition, guidelines from the National Institutes of Health (NIH) state that there are insufficient data to recommend for or against the use of Olumiant® in combination with remdesivir, where corticosteroids can be used instead, and there is insufficient data to recommend for or against the use of Olumiant®, in combination with corticosteroids.[484] We are therefore interested in data regarding the use of Olumiant® in combination with remdesivir over corticosteroids.

We welcome public comment on whether Olumiant® meets the substantial clinical improvement criterion.

In this section, we summarize and respond to written public comments

received in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for Olumiant®.

Comment: The applicant responded to questions elicited by its presentation at the New Technology Town Hall Meeting held in December 2020.

The applicant was asked to elaborate on the efficacy of Olumiant® and remdesivir as monotherapies versus in combination and how to think about appropriate use. The applicant stated that the evidence generated in randomized controlled clinical trials designed to evaluate remdesivir, Olumiant®, and the combination of Olumiant® and remdesivir has come primarily from the Adaptive Covid–19 Treatment Trial (ACTT) trials sponsored by NIAID. The applicant also stated that ACTT–1 was the first trial of the ACTT program and showed that remdesivir, when compared to placebo, is an effective treatment for hospitalized adult patients with coronavirus disease 2019 (Covid–19) pneumonia who were receiving standard of care as background treatment. The applicant stated that to address unmet medical needs still identified after the completion of ACTT–1 (namely morbidity and mortality due to Covid–19), ACTT–2 was designed to evaluate the combination of Olumiant® and remdesivir versus remdesivir in hospitalized adult patients with Covid–19 pneumonia who were receiving standard of care as background treatment. The applicant stated that the study did not evaluate Olumiant® alone; therefore, they do not have results generated by a RCT on the efficacy and safety profile of Olumiant® alone for the treatment of Covid–19 patients. The applicant stated that the ACTT–2 trial results show that the combination of Olumiant® was superior to remdesivir and placebo in reducing recovery time and accelerating improvement in clinical status among hospitalized patients with Covid–19, notably among those receiving high-flow oxygen or noninvasive ventilation.

The applicant was asked what the mechanism of action is for baricinitib's antiviral activity. The applicant stated that patients diagnosed with COVID–19 are at an elevated risk for excess morbidity and mortality due to the underlying severe acute respiratory syndrome coronavirus 2 (SARS–CoV–2) infection and subsequent cytokine activation. Management of COVID–19 is supportive; and respiratory failure from acute respiratory distress syndrome (ARDS) is the leading cause of mortality. The cause of respiratory failure in COVID–19 is a hyperinflammatory state characterized by upregulation of multiple cytokines. The applicant stated that in Wuhan, China, COVID–19-infected patients admitted to the ICU exhibited increased plasma concentrations of IL–2, IL–7, IL–10, GM–CSF, IP–10, MCP–1, MIP1-α, and TNF-α, compared with the non-ICU patients. Elevated IL–6 and hyperferritinemia were predictors of death in these patients with COVID–19.[485] [486] [487]

The applicant stated that Olumiant® may be a viable treatment in patients with COVID–19 requiring supplemental oxygen, invasive mechanical ventilation, or ECMO because of its anti-inflammatory activity and ability to reverse dysregulated inflammatory markers in patients with COVID–19.[488] [489] Relevant to COVID–19 and the potential role played by IL–6, the applicant stated that it is notable that treatment with Olumiant® 4 mg resulted in reduced plasma levels of IL–6 in hospitalized patients with COVID–19, a finding that was replicated after being observed in patients with RA.[490] [491] [492]

The applicant stated that the biochemical inhibitory effects of Olumiant® on human numb-associated kinase (NAK) members, responsible for SARS–CoV–2 viral propagation, measuring nanomolar affinities for AAK1, BIKE, and GAK were recently confirmed.[493] In addition, the applicant noted that some plasma markers that were dysregulated in moderate to severe hospitalized patients with COVID–19, that represent myeloid dysregulation, endothelial and cardiovascular inflammation, along with reduced antigen presenting plasmacytoid dendritic cells, were normalized over time with Olumiant® treatment.[494] The applicant stated that the impact of this antiviral host activity in patients with COVID–19 is being evaluated through collection of nasopharyngeal swabs, serum and whole blood for RNA, epigenetic analysis, and cellular phenotyping in the ongoing randomized Study KHAA.

The applicant stated that previous studies of corticosteroids in other viral pneumonias, especially SARS and Middle East respiratory syndrome (MERS), found an association with delayed viral clearance, and reinforced concerns that corticosteroids may impair host response to SARS–CoV–2.[495] [496] In contrast, treatment with Olumiant® from 2 distinct clinical case series indicate that the adaptive immune response responsible to generate IgG antibodies against SARS–CoV–2-specific spike proteins remains intact after treatment with Olumiant®.[497] [498] The applicant stated that the effects of corticosteroid treatment on adaptive immunity are

believed to occur through the non-canonical signaling pathways. The applicant asserted that the immunomodulatory pathway targeted by Olumiant®, JAK1/JAK2 signaling, opposed to NFKB (nuclear factor kappa-B cells) signaling targeted by corticosteroids, may offer an explanation to these effects.

The applicant also noted differences between Olumiant® and dexamethasone. The applicant stated that drugs acting on glucocorticoid receptors, such as dexamethasone, have a broad pathway approach to reduce inflammation that is known to be associated with profound immunosuppression, secondary hospital-acquired infections, gastrointestinal bleeding, hyperglycemia, and post-hospital neuromuscular weakness. JAK inhibitors, such as Olumiant®, act on several critical pathways to reduce inflammation while minimizing biological redundancy and have favorable PK properties and less immunosuppression.[499]

The applicant stated that the anti-inflammatory effects of Olumiant® have also been demonstrated by the reduction of serum levels of IFN-γ, IP–10, GM–CSF, and MCP–1 in pediatric patients with steroid-dependent chronic inflammation, resulting in control of disease activity and the ability to wean or taper steroids.[500] The applicant went on to state that, furthermore, dose-dependent decreases in IFN biomarkers confirmed an in vivo effect of Olumiant® on type-1 IFN signaling in pediatric patients suffering from CANDLE and SAVI.[501]

The applicant was asked if the adverse events were higher or unchanged among at risk subgroup populations over 65 years with comorbidities such as diabetes or chronic lung or renal disease in patients with COVID–19 and treated with Olumiant®. The applicant responded that there were 71 and 78 patients in the remdesivir+placebo groups and Olumiant®+remdesivir groups, respectively, who were over 65 years of age and had diabetes, chronic lung disease or renal disease in ACTT–2. The applicant stated that treatment emergent adverse events were reported in 62.0 percent of remdesivir+placebo and 57.7 percent of Olumiant®+remdesivir patients. Serious adverse events were reported in 33.8 percent of remdesivir+placebo and 28.2 percent of Olumiant®+remdesivir patients. The applicant stated that these findings are consistent with that in the overall population; fewer events in the Olumiant®+remdesivir group compared to remdesivir and placebo group.

Lastly, the applicant was asked to explain the difference in median time to recovery between patients who did not receive oxygen, which was 5 days in the Olumiant® and remdesivir group, and 4 days in the remdesivir and placebo group. For patients that did receive supplemental O2 and other respiratory interventions, the median time to recovery was shorter in those patients who received Olumiant® and remdesivir compared to the remdesivir and placebo group. The applicant replied that across all outcome measures, a more pronounced treatment effect was observed in patients with more severe disease at baseline. These data did not show additional benefit of adding Olumiant® to remdesivir for patients in the milder disease status. The applicant also stated that the ACTT–2 trial was not designed or powered to evaluate efficacy in each subgroup of patients per baseline ordinal scale. The applicant stated that these data led the applicant to request Emergency Use Authorization for Olumiant® and FDA authorized the use of Olumiant® in combination with remdesivir, for treatment of suspected or laboratory confirmed COVID–19 in hospitalized adults and pediatric patients 2 years of age or older, requiring supplemental oxygen, invasive mechanical ventilation, or extracorporeal membrane oxygenation (ECMO).

Response: We appreciate the applicant's comment. We will take the responses into consideration when deciding whether to approve new technology add-on payments for Olumiant®.

n. Pure-Vu® System

Motus GI holdings, Inc. submitted an application for new technology add-on payments for the Pure-Vu® System for FY 2022. The Pure-Vu® System is an FDA cleared system designed to connect to currently marketed colonoscopes to provide high intensity, intra-procedural cleansing of the colon during a colonoscopy. According to the applicant, the Pure-Vu® System is indicated for use in patients requiring therapeutic or diagnostic colonoscopies where the bowel has not been adequately prepared. The applicant asserted that the Pure-Vu® System would be used in situations such as a lower gastrointestinal bleed (LGIB), as LGIB does not allow for adequate bowel preparation.

The applicant asserted that the Pure-Vu® System device helps to avoid aborted and delayed colonoscopy procedures due to poor visualization of the colon mucosa by creating a unique High Intensity, Pulsed Vortex Irrigation Jet that consists of a mixture of air and water to break-up fecal matter, blood clots, and other debris, and scrub the walls of the colon while simultaneously removing the debris through two suction channels. The applicant stated that the suction channels have a sensor to detect the formation of a clog in the channels, triggering the system to automatically purge and then revert to suction mode once the channel is clear. According to the applicant, this combination of the agitation of the fluid in the colon via the pulsed vortex irrigation and simultaneous removal of the debris allows the physician to visualize the colon and achieve a successful colonoscopy or other advanced procedure through the colonoscope even if the patient is not properly prepped and has debris either blocking the ability to navigate the colon or covering the colon wall obscuring the mucosa and any pathology that may be present. The applicant asserted that the constant volume suction pumps do not cause the colon to collapse, which allows the physician to continue to navigate the colon while cleansing and avoids the need to constantly insufflate the colon, which may be required with other colonoscopy irrigation systems.

The applicant stated that the Pure-Vu® System is comprised of a workstation that controls the function of the system, a disposable oversleeve that is mounted on a colonoscope and inserted into the patient, and a disposable connector with tubing (umbilical tubing with main connector) that provides the interface between the workstation, the oversleeve, and off the shelf waste containers.

The applicant explained that the workstation has two main functions: Cleansing via irrigation and evacuation, and acting as the user interface of the system. The applicant explained that the irrigation into the colon is achieved by an electrical pump that supplies pressurized gas (air) and a peristaltic

[499] Stebbing J, Krishnan V, de Bono S, et al; Sacco Baricitinib Study Group. Mechanism of baricitinib supports artificial intelligence-predicted testing in COVID–19 patients. EMBO Mol Med. 2020; 12(8):e12697. *https://doi.org/10.15252/emmm.202012697.*

[500] Sanchez GAM, Reinhardt A, Ramsey S, et al. JAK1/2 inhibition with baricitinib in the treatment of autoinflammatory interferonopathies. J Clin Invest. 2018; 128(7):3041–3052. *https://doi.org/10.1172/JCI98814.*

[501] Kim H, Brooks KM, Tang CC, et al. Pharmacokinetics, pharmacodynamics, and proposed dosing of the oral JAK1 and JAK2 inhibitor baricitinib in pediatric and young adult CANDLE and SAVI patients. Clin Pharmacol Ther. 2018; 104(2):364–373. *https://doi.org/10.1002/cpt.936.*

pump that supplies the liquid (water or saline). According to the applicant, the pressurized gas and liquid flow through the ''main connector'' and are mixed upon entry into the umbilical tubing that connects to the oversleeve. The applicant explained that the gas pressure and flow are controlled via regulators and the flow is adjusted up or down depending on the cleansing mode selected. The applicant stated that a foot pedal connected to the user interface activates the main functions of the system so that the user's hands are free to perform the colonoscope procedure in a standard fashion.

The applicant stated that the evacuation mode (also referred to as suction) removes fecal matter and fluids out of the colon. The applicant noted that the evacuation function is active during cleansing so that fluid is inserted and removed from the colon simultaneously. The applicant explained that the evacuation pumps are designed in a manner that prevents the colon from collapsing when suctioning, which facilitates the ability to simultaneously irrigate and evacuate the colon. According to the applicant, during evacuation, the system continuously monitors the pressure in the evacuation channels of the oversleeve and if the pressure drops below pre-set limits the pumps will automatically reverse the flow. The applicant explained that the clog sensor triggers the system to automatically purge the material out of the channel and back into the colon where it can be further emulsified by the Pulsed Vortex Irrigation Jet, and then automatically reverts back into evacuation mode once the channel is cleared. The applicant stated that the evacuation (suction) that drains fecal matter and fluids out of the colon is generated by peristaltic pumps that can rotate in both directions, either to evacuate fluids and fecal matter from the colon through the evacuation tubes and into a waste container, or while in the reverse direction, to purge the evacuation tubes. The applicant claimed the suction created by this type of pump creates a constant volume draw of material from the colon and therefore prevents the colon from collapsing rapidly. According to the applicant, purging of evacuation tubes may be activated in two ways: The purging cycle is automatically activated when low pressure is noted by the evacuation-line sensor (it is also activated for the first 0.5 seconds when evacuation is activated to make sure the line is clear from the start); or a manual purge may be activated by the user by pushing the ''manual purge'' button on the foot pedal. The applicant claimed the pressure-sensing channel is kept patent by using an air perfusion mechanism where an electrical pump is used to perfuse air through the main connector and into the oversleeve, while the sensor located in the workstation calculates the pressure via sensing of the channel.

The applicant explained the Pure-Vu® System is loaded over a colonoscope and that the colonoscope with the Pure-Vu® Oversleeve is advanced through the colon in the same manner as a standard colonoscopy. The applicant stated that the body of the oversleeve consists of inner and outer sleeves with tubes intended for providing fluid path for the cleansing irrigation (2X), the evacuation of fluids (2X), the evacuation sensor (1X) and that the flexible head is at the distal end of the oversleeve and is designed to align with the colonoscope's distal end in a consistent orientation. The applicant explained that the distal cleansing and evacuation head contains the irrigation ports, evacuation openings, and a sensing port. According to the applicant, the system gives the physician the control to cleanse the colon as needed based on visual feedback from the colonoscope to make sure they have an unobstructed view of the colon mucosa to detect and treat any pathology. The applicant noted that since the Pure-Vu® System does not interfere with the working channel of the colonoscope, the physician is able to perform all diagnostic or therapeutic interventions in a standard fashion with an unobstructed field of view.

According to the applicant, multiple studies have shown that inadequate bowel visualization leads to missed pathology, delayed diagnosis, extended hospital stay, and in some cases, additional therapy being administered, especially in the acute LGIB population, which is the most common indication for inpatients that require colonoscopy.[502] [503] Unknown abdominal pain, infection, and foreign body removal were also cited by the applicant as being common indications for an inpatient colonoscopy.

The applicant explained that when a patient with LGIB is admitted to the hospital, they are stabilized and then started on bowel preparation for the colonoscopy procedure. The applicant claimed that the patient typically is placed on a liquid-only diet while consuming 4–6 liters of polyethylene glycol (PEG) based solution until the rectal effluent is clear. If the rectal effluent is not clear, additional bowel preparation is prescribed. The applicant stated that for severe LGIB cases, a patient is prescribed to consume a rapid purge of 1 liter every 30–45 minutes with a total volume of 4–14 liters, which could lead to purgative intolerance or vomiting. The applicant claimed that even in situations where bowel preparation has been completed, and clear rectal effluent while on a clear liquid diet has been confirmed, there are no guarantees that a patient's bowel is clean for a successful colonoscopy. The applicant submitted data from a study by the Cleveland Clinic showing 51 percent of 8,819 patients observed over a 4-year period were inadequately prepared for colonoscopies, leading to one extra day in the hospital compared to patients that were adequately prepared.[504] The applicant cited another study, by Northwestern University, demonstrating an association between inadequate bowel preparation and increased length of stay (LOS) in hospitals, with inadequately prepared patients staying two more days than adequately prepared patients on average.[505] The applicant claimed additional time spent in hospitals increases the patient's exposure to risks of hospital-acquired infections. The applicant claimed this risk is especially impactful to patients who are admitted for LGIB, which is seen at a higher prevalence in the elderly population.[506] [507] The applicant stated in the elderly population, continuous bowel preparation also poses increased risk due to their higher comorbidities and potential for electrolyte imbalances such as hyperphosphatemia, hypocalcemia, and hypokalemia.[508]

[504] Garber A, Sarvepalli S, Burke CA, Bhatt A, Ibrahim M, McMichael J, et al. Modifiable Factors Associated with Quality of Bowel Preparation Among Hospitalized Patients Undergoing Colonoscopy. J Hosp Med. 2019; 14(5):278–83.

[505] Yadlapati R, Johnston ER, Gregory DL, Ciolino JD, Cooper A, Keswani RN. Predictors of Inadequate Inpatient Colonoscopy Preparation and Its Association with Hospital Length of Stay and Costs. Dig Dis Sci. 2015; 60(11):3482–90.

[506] Parra-Blanco A, Ruiz A, Alvarez-Lobos M, Amoros A, Gana JC, Ibanez P, et al. Achieving the best bowel preparation for colonoscopy. World J Gastroenterol. 2014; 20(47):17709–26.

[507] Hauck K, Zhao X. How dangerous is a day in hospital? A model of adverse events and length of stay for medical inpatients. Med Care. 2011; 49(12):1068–75.

[508] Parra-Blanco A, Ruiz A, Alvarez-Lobos M, Amoros A, Gana JC, Ibanez P, et al. Achieving the best bowel preparation for colonoscopy. World J Gastroenterol. 2014; 20(47):17709–26.

The applicant cited a practical guide authored by Kim B., et al., to assert that poor visualization of the colon mucosa has a direct effect on the ability to detect the presence of a GI bleed or the aftermath stigmata and administer treatment successfully.[509] The applicant used the Boston Bowel Preparation Scale (BBPS), developed by Lai E. et al,[510] as a reliable method to measure bowel preparation. The applicant stated that the scale is a range (0–9) of dirtiest to cleanest for the whole colon and 0 to 3 for each of the 3 segments of the colon; the right colon (including the cecum and ascending colon), the transverse colon (including the hepatic and splenic flexures), and the left colon (including the descending colon, sigmoid colon, and rectum). Therefore, the maximum BBPS score for a perfectly clean colon without any residual liquid is nine and the minimum BBPS score for an unprepared colon is zero. The points are assigned as follows: Zero = Unprepared colon segment with mucosa not seen due to solid stool that cannot be cleared; one = Portion of mucosa of the colon segment seen, but other areas of the colon segment not well seen due to staining, residual stool and/or opaque liquid; two = Minor amount of residual staining, small fragments of stool and/or opaque liquid, but mucosa of colon segment seen well; three = Entire mucosa of colon segment seen well with no residual staining, small fragments of stool or opaque liquid.

The applicant stated that evidence-based guidelines and clinical reviews in high impact biomedical journals recommend colonoscopy as the preferred initial modality for the diagnosis and treatment of acute lower gastrointestinal bleeding.[511] [512] The applicant stated that colonoscopy has been less frequently utilized than might otherwise be indicated because it suffers from the significant disadvantage of requiring the need for a large volume bowel preparation.[513] The applicant states that even with a bowel preparation, poor visualization often occurs because of a poorly prepared colon. Based on these assertions, the applicant inferred that colonoscopy for acute lower gastrointestinal bleeding would be much more utilized and lead to more diagnoses and interventions with intraprocedural bowel preparation, which puts the control of the visualization (cleanliness) of the colon mucosa in the hands of the endoscopist. The applicant further stated it is important to appreciate that alternatives to colonoscopy, including angiography and vascular embolization treatments to create hemostasis, have risks of ischemic vascular injury, retroperitoneal bleeding and acute renal injury.[514] The applicant stated that aside from the colonoscopy, other modalities such as tagged red blood cell scans, computed tomography (CT) angiograms, and mesenteric angiographies all require an active source of bleed in order to achieve a successful diagnostic yield. The applicant claimed that even when diagnosis is achieved using these modalities, a colonoscopy may still be ordered to treat the source of the bleed via epinephrine injections and clipping and thermal therapies, to prevent potential surgical interventions.

With respect to the newness criterion, the Pure-Vu® System first received FDA 510(k) clearance on September 22, 2016 under 510(k) number K60015. Per the applicant, this initial device was very cumbersome to set up and required direct support from the company and therefore was not viable for a small company with limited resources to market the device. The applicant noted that the initial device could have been sold starting on January 27, 2017 when the first device came off the manufacturing line. Per the applicant, the device was allocated for clinical evaluations but 10 institutions throughout the country purchased the device outside of a clinical study, primarily to allow physicians to try the product prior to committing to a clinical trial. The applicant further noted that minor modifications were made to the Pure-Vu System in additional 510(k) clearances dated December 12, 2017 and June 21, 2018. The current marketed Pure-Vu System was then granted 510(k) clearance on June 6, 2019 under 510(k) number K191220. Per the applicant, this clearance changed the entire set-up of the device, redesigned the user interface, and reduced the size, among other changes. According to the applicant, this updated version was commercially available as of September 19, 2019.

Currently, there are no ICD–10–PCS procedure codes to uniquely identify procedures involving the Pure-Vu® System. We note that the applicant has submitted a request for approval for a unique ICD–10–PCS code for the use of the Pure-Vu® System beginning FY 2022.

If a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and therefore would not be considered ''new'' for purposes of new technology add-on payments.

With respect to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, the applicant asserted that the Pure-Vu® System has a different mechanism of action than existing technologies due to its ability to break up and remove a high volume of debris from the colon and dislodge adherent films from the colon wall in a safe manner that cannot be achieved with irrigation done through the working channel of a colonoscope. The applicant also asserted that due to the controlled simultaneous removal of the debris and fluid by the evacuation pumps in the system, the Pure-Vu® System eliminates the likelihood of creating a fluid load in the colon, which cannot be achieved with any other device on the market. The applicant further asserted a differing mechanism of action via the ability to sense and automatically clear a blockage versus manual suction through the working channel of a colonoscope, which can clog quickly if there is any appreciable debris. Lastly, the applicant explained that the Pure-Vu® System is an oversleeve device that allows use of the working channel of the colonoscope to be open and allows therapy to be administered in tandem with cleansing, unlike existing technologies on the market.

The applicant noted that the ClearPath system, a colonoscopy system by the company Easy Glide, received FDA clearance, but according to the applicant, was never fully brought to the US market. ClearPath was listed as the predicate device for the initial version of the Pure-Vu System® approved on September 22, 2016 (FDA 510(K) number K160015), in which both

[512] Gralnek IM, Neeman Z, Strate LL. Acute Lower Gastrointestinal Bleeding. N Engl J Med. 2017 Mar 16;376(11):1054–1063. doi: 10.1056/NEJMcp1603455. PMID: 28296600.

[513] Carney BW, Khatri G, Shenoy-Bhangle AS. The role of imaging in gastrointestinal bleed. Cardiovasc Diagn Ther. 2019 Aug;9(Suppl 1):S88–S96. doi: 10.21037/cdt.2018.12.07. PMID: 31559156; PMCID: PMC6732104.

[514] Ibid. Carney BW, Khatri G, Shenoy-Bhangle AS. The role of imaging in gastrointestinal bleed. Cardiovasc Diagn Ther. 2019 Aug;9(Suppl 1):S88–S96. doi: 10.21037/cdt.2018.12.07. PMID: 31559156; PMCID: PMC6732104.

devices are described as able to irrigate and suction at any time during the procedure without any tools needing to be removed from the colonoscope working channel.[515] The applicant claimed that this system did not have the High Intensity Pulsed Vortex Irrigation Jet and controlled suction capabilities with the sensing and auto purge technology that is critical to get the desired clinical outcome.

With respect to the second criterion, whether a product is assigned to the same or a different MS–DRG, the applicant stated that the Pure-Vu System is assigned to the same MS–DRGs as existing technologies. The applicant lists 21 MS–DRGs as being applicable, with MS–DRG 378 (gastrointestinal hemorrhage with complication or comorbidity (CC)) accounting for 37.1 percent of cases, and MS–DRG 377 (gastrointestinal hemorrhage with major complication or comorbidity (MCC)) accounting for 18.9 percent of total cases.

With respect to the third criterion, whether the new use of technology involves the treatment of the same or similar type of disease and the same or similar patient population when compared to an existing technology, the applicant stated that the Pure-Vu System® does involve treatment of the same or similar type of disease and patient population as existing technology.

After reviewing the information submitted by the applicant, we are unclear whether the Pure-Vu® System's mechanism of action is similar to that of the version of the product that received initial 510(k) clearance that was approved on September 22, 2016 or other versions of the system. In addition, with regard to the previous versions of Pure-Vu, we are unsure if the limited availability noted by the applicant would allow the technology to be considered commercially available. We are also unclear what the applicant means regarding the ClearPath system being not fully brought to the U.S. market. If the ClearPath system and/or earlier versions of the Pure-Vu System were considered to be available on the U.S. market, then we are concerned that the current version of Pure-Vu® would no longer be considered new, as we believe it may be substantially similar to ClearPath and/or earlier versions of the Pure-Vu® System because they also allow for irrigation and suction of the colon without utilizing the working channel. If the current version of Pure-Vu is substantially similar to ClearPath and/or previous versions, then it appears that the current Pure-Vu system may no longer be within the newness period. We further note that though the applicant states the Pure-Vu® System features a high intensity pulsed vortex irrigation jet and controlled suction capabilities with sensing and auto purge technology, the Pure-Vu® System irrigates the colon using water and gas like other existing irrigation methods. We are therefore uncertain as to whether these features of the Pure-Vu® System result in a new mechanism of action. We invite public comment on whether the Pure-Vu® System has a new mechanism of action compared to these predicate devices.

We are inviting public comments on whether the Pure-Vu® System is substantially similar to existing technologies and whether it meets the newness criterion.

With regard to the cost criterion, the applicant searched the FY 2019 MedPAR claims data file with the FY 2019 Final Rule with Correction Notice IPPS Impact File to identify potential cases representing patients who may be eligible for treatment using the Pure-Vu® System. The applicant identified claims that reported an ICD–10–CM diagnosis code of ICD–10–CM Z12.11 (Encounter for screening for malignant neoplasm of colon), K92.2 (Gastrointestinal hemorrhage, unspecified), D50.0 (Iron deficiency anemia secondary to blood loss (chronic)), and C18._[516] (malignant neoplasm of colon). The ICD–10–PCS procedure codes listed in the following table were used to identify claims involving colonoscopy procedures.

ICD-10-PCS Code	Description
0DJD8ZZ	Inspection of lower intestinal tract, via natural or artificial opening endoscopic
0D5M8ZZ	Destruction of descending colon, via natural or artificial opening endoscopic
0D5N8ZZ	Destruction of sigmoid colon, via natural or artificial opening endoscopic
0D5L8ZZ	Destruction of transverse colon, via natural or artificial opening endoscopic
0D5K8ZZ	Destruction of ascending colon, via natural or artificial opening endoscopic
0W3P8ZZ	Control bleeding in gastrointestinal tract, via natural or artificial opening endoscopic

The claim search conducted by the applicant resulted in 163,236 claims mapping to 633 MS–DRGs. The applicant stated that MS–DRGs 377 (G.I. Hemorrhage W MCC), 378 (G.I. Hemorrhage W CC), and 379 (G.I. Hemorrhage W/O CC/MCC) were the most common MS–DRGs to which cases reporting the listed ICD–10–PCS codes were assigned. The applicant stated that the large number of DRGs to which these cases were assigned suggests that patients were admitted to the hospital for a wide variety of reasons, but during the course of their hospital stay the patients received a colonoscopy. According to the applicant, since GI bleeding is among the most common reasons for a patient needing an urgent colonoscopy, MS–DRGs 377–379 would be expected to be the most common MS–DRGs to which cases involving the Pure-Vu technology would be assigned. Lastly, the applicant did not have any data available to suggest any specific reasons why potential patients who would be eligible for the Pure-Vu technology would map to specific MS–DRGs identified based on the claims search, such as MS–DRG 291 (Heart Failure and Stroke).

The applicant determined an average unstandardized case weighted charge per case of $63,265.

The applicant did not remove charges for prior technology. The applicant stated that no prior technology is being replaced. The applicant then standardized the charges using the FY 2019 Final Rule with Correction Notice Impact File. Next, the applicant applied the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges (1.13218). To calculate the charges for the new technology, the applicant used the national average CCR for the

[515] FDA. 2016, September. Pure Vu System 510(k) premarket notification. Deparment of Health and Human Services. Accessed at *https://www.accessdata.fda.gov/cdrh_docs/pdf16/K160015.pdf.*

[516] Fourth character is required to describe specific location of neoplasm.

Supplies and Equipment cost center of 0.297 from the FY 2021 Final IPPS rule. The applicant calculated a final inflated average case-weighted standardized charge per case of $93,914, which exceeded the average case-weighted threshold amount of $63,265 by $30,649. The applicant stated that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the therapy meets the cost criterion.

After reviewing the information submitted by the applicant as part of its FY 2022 new technology add-on payment application for the Pure-Vu® System, we note that the MS–DRGs used in the cost analysis were not limited to those describing conditions likely to require a colonoscopy. For example, the applicant included cases assigned to MS–DRG 291 (Heart Failure and Shock with MCC). When included in the cost analysis, the assumption made is that all 1,948 cases for heart failure also had a colonoscopy performed where the technology could have potentially been utilized. We question whether all cases identified by the applicant appropriately represent potential cases eligible for the Pure-Vu® System. We invite public comment on whether the Pure-Vu® System meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that the Pure-Vu® System offers the ability to achieve rapid beneficial resolution of the disease process treatment by achieving rapid and full visualization of the colon, which will improve diagnostic yield and the effectiveness of treatment of diseases of the bowel. The applicant claimed that due to the Pure-Vu® System's ability to cleanse the colon during the colonoscopy procedure in conjunction with a standard bowel preparation, or with an enema (to allow entry into the rectum) and without any purgative based preparation, the technology allows for earlier intervention. The applicant stated that in the case of an LGIB, this will reduce bleeding by achieving more rapid hemostasis and reduce the overall length of stay in the hospital for a portion of this population. The applicant also asserted the technology reduces the subsequent diagnostic and, in some instances, therapeutic interventions by minimizing aborted and early repeat procedures due to poor visualization caused by inadequate preparation. The applicant stated that the system can provide cleansing and removal of fecal matter, blood and other debris while maintaining the visibility of the colonoscope's camera and availability of the working channel to apply critical therapies.

In support of its claims, the applicant submitted a self-sponsored, U.S.-based, multicenter, prospective, single arm study in the inpatient setting, analyzing 94 patients, 65 of which (68 percent) had a GI bleed.[517] Of the 94 patients (41 percent females/59 percent males), the mean age was 62 years. According to the applicant, the study's primary endpoint was the rate of improved bowel cleansing level from baseline to after use of the Pure-Vu® System per colon segment using the Boston Bowel Preparation Scale (BBPS). The BBPS score was recorded for each colorectal segment (left colon, transverse colon, and right colon segments) both prior to (baseline) and after colon cleansing with the Pure-Vu® System. An adequate cleansing level was *a priori* defined as a BBPS ≥2 in all evaluated colon segments. The study found that in 79 of the 94 patients (84 percent), the physician was able to successfully diagnose or rule out a GI bleed in the colon per the patients' colonoscopy indication using only the Pure-Vu® System. The analysis showed statistically significant visualization improvement in each colon segment after Pure-Vu® use with a mean BBPS score in the descending colon, sigmoid, and rectum of 1.74 pre-Pure-Vu® use and 2.89 post-Pure-Vu® use ($P<0.001$); in the transverse colon of 1.74 pre-Pure-Vu® use and 2.91 post Pure-Vu® use ($P<0.001$); and the ascending colon and cecum of 1.50 pre-Pure-Vu® use and 2.86 post Pure-Vu® use ($P<0.001$). The study found only 2 percent of cases where the diagnosis could not be achieved due to inadequate preparation. Overall, the 84 (89.4 percent) patients that received the Pure-Vu® System within the study improved BBPS scores from 38 percent (95 percent CI 28, 49) to 96 percent (95 percent CI 90, 99) in segments evaluated. The study noted one procedure related perforation which required surgical repair, and the patient was discharged 48 hours post operatively and recovered fully.

The applicant also provided three outpatient clinical studies to demonstrate the Pure-Vu® System's capability to convert patients to adequate preparation where preparation was previously inadequate, and the visualization was poor based on the BBPS. In the first study, Perez J., et al. conducted an outpatient prospective pilot study using the Pure-Vu® System.[518] The study observed 50 patients with poorly prepared colons undergoing colonoscopy at two outpatient clinical sites in Spain and Israel, respectively. The applicant claimed study patients underwent a reduced bowel preparation consisting of the following: No dried fruits, seeds, or nuts starting 2 days before the colonoscopy, a clear liquid diet starting 18 to 24 hours before colonoscopy, and a split dose of 20mg oral bisacodyl. The study found the number of patients with an adequate cleansing level (BBPS≥2 in each colon segment) increased significantly from 31 percent (15/49) prior to use of the Pure-Vu System (baseline) to 98 percent (48/49) after use of the Pure-Vu® System ($P<0.001$), with no serious adverse events reported.

In the second study provided by the applicant, van Keulen, et al. also conducted a single-arm, prospective study on 47 patients with a median age of 61 years in the outpatient setting in the Netherlands using the Pure-Vu® System.[519] Within the study, cecal intubation was achieved in 46/47 patients. This multicenter feasibility study found that the Pure-Vu® System significantly improved the proportion of patients with adequate bowel cleansing from 19.1 percent prior to the use of the Pure-Vu® System to 97.9 percent after its use ($P<0.001$) and median BBPS score (from 3.0 [IQR 0.0–5.0] to 9.0 [IQR 8.0–9.0]).

In the third study provided by the applicant that directly evaluated the Pure-Vu® System in a clinical setting, Bertiger G., et al. performed a United States-based single center, prospective, outpatient study investigating regimes of reduced outpatient bowel preparations, which included low doses of over-the-counter laxatives, and eliminating the typical 24 hour clear liquid diet restriction, which was replaced by a low residue diet the day before the procedure. In this study, 46 of a possible 49 patients received a colonoscopy, 8 of which took the over-the-counter laxative (''MiraLAX arm''), 21 patients ingested two doses of 7.5 oz Magnesium Citrate (MgC) each taken with 19.5 oz of clear liquid (''Mag Citrate 15 oz arm''), and 18 patients

[517] Helmut Neumann ML, Tim Zimmermann, Gabriel Lang, Jason B. Samarasena, Seth A. Gross, Bhaumik Brahmbhatt, Haleh Pazwash, Vladimir Kushnir. Evaluation of bowel cleansing efficacy in hospitalized patient population using the pure-vu system. Gastrointestinal Endoscopy. 2019;89(6).

[518] Perez Jimenez J, Diego Bermudez L, Gralnek IM, Martin Herrera L, Libes M. An Intraprocedural Endoscopic Cleansing Device for Achieving Adequate Colon Preparation in Poorly Prepped Patients. J Clin Gastroenterol. 2019;53(7):530–4.

[519] Van Keulen KE, Neumann H, Schattenberg JM, Van Esch AAJ, Kievit W, Spaander MCW, Siersema PD. A novel device for intracolonoscopy cleansing of inadequately prepared colonoscopy patients: A feasibility study. Endoscopy. 2019 Jan;51(1):85–92. doi: 10.1055/a–0632–1927. Epub 2018 Jul 11.

ingested 2 doses of 5 oz MgC taken with 16 oz of clear liquid (''Mag Citrate 10 oz arm''). Of the 46 subjects, 59 percent were males and there was a mean age of 61±9.48 years. The study found that each of the 3 study arms revealed significant differences in BBPS score between the baseline preparation and post-cleansing via Pure-Vu. All the preparation regimens resulted in inadequately prepped colons. Comparing the mean BBPS rating for both pre- and post- Pure-Vu® use, the MiraLAX arm was inferior (P <0.05) to both Mag Citrate arms. For the MiraLAX arm, the mean BBPS Score improved from 1.50 to 8.63. For the Mag Citrate 15 oz arm, the mean BBPS score improved from 3.62 to 8.95. For the Mag Citrate 10 oz arm, the mean BBPS Score improved from 4.76 to 9.0.

In addition to the retrospective studies provided, the applicant also submitted three case studies to highlight the various clinical presentations of LGIB with the use of the Pure-Vu® System. In the first case, the applicant presented a 71-year-old woman with multiple episodes of bloody bowel movements and low hemoglobin levels for 2 days after a screening colonoscopy where 8 polyps were removed. The applicant stated that the patient underwent a successful colonoscopy using Pure-Vu without standard inpatient bowel preparation within 5 hours, and in addition to expediting the colonoscopy, four significant post-polypectomy ulcers were found and clipped by allowing the physician to cleanse the area and place the clips simultaneously. The applicant claimed that since the Pure-Vu® System does not impact the use of the endoscope's working channel, the physician was able to cleanse the area as needed during the intervention to allow precise placement of the clips applied to achieve hemostasis and the patient was discharged that same day.

The applicant submitted another case example where a 52-year-old male was admitted from the emergency department to the ICU due to significant GI bleeding, hemorrhagic shock, and acute kidney injury (AKI) six days after a colonoscopy where nine polyps were removed, including two polyps greater than 2 cm. The applicant stated that angiographic control of the bleeding was not considered due to AKI with rising creatinine, and bedside colonoscopy was immediately performed with the Pure-Vu® System without any bowel prep. Per the applicant, the physician was able to visualize the entire colon to confirm all sources of bleeding and place two clips to obtain hemostasis, and the patient was downgraded out of the ICU that day and discharged from the hospital the following day.

In the third case study submitted by the applicant, a 64-year-old male was admitted to the ICU with one day of bright red blood per rectum (BRBPR) along with a complex set of disorders including but not limited to alcohol use disorder, heart failure with reduced ejection fraction of 30 percent, and multidrug resistant tuberculosis. The Pure-Vu® System was used to attempt to definitively identify the bleeding source in the ICU. The applicant stated that although no active sites of bleeding were seen, red blood was found in the entire colon, and the patient was transferred out of the ICU 2 days later and discharged 3 days after transfer to the floor. The applicant claimed that while the patient's bleeding had stopped by the time the colon was examined, the ability to directly visualize the entire colon using the Pure-Vu® System helped avoid a third CT angiography during this hospitalization and helped the physicians to confirm that prior coil embolization had not resulted in focal colonic ischemia. The applicant asserted that this case showed that the Pure-Vu® System can be used with minimal preparation, enabling rapid investigation of LGIB in a very complex patient. The applicant concluded that these case studies demonstrate that a change in patient management occurs when the option of the Pure-Vu® System is available, especially when there is an urgent or severe GI bleed, where circumstances where other procedures (such as CT angiography) are insufficient and the option to perform the colonoscopy sooner is preferred.

After reviewing the information submitted by the applicant as part of its FY 2022 new technology add-on payment application for the Pure-Vu® System, we have the following concerns. While the studies provided in support of the Pure-Vu® System measure improvement of bowel preparation using the BBPS, the applicant did not provide data indicating that the improved BBPS directly leads to improved clinical outcomes (for example, reduction of blood loss in LGIB or reduction of missed polyps) based on use of the Pure-Vu® System. Additionally, we note that the applicant has not provided any studies comparing the efficacy of the Pure-Vu® System to other existing methods or products for irrigation in support of its claims that the product is superior at removing debris from the colon while simultaneously preventing the colon from collapsing, allowing use of the working channel, or improving outcomes. Furthermore, we note that many of the provided studies were based on small sample sizes, which may affect the quality and reliability of the data provided in support of the technology. In addition, we note that the methodology described in the provided studies often involved time to adequately prepare the colon and included outpatient planned procedures, which may not reflect the emergent situations that the applicant states the Pure-Vu® System is intended to address in the inpatient setting. We also note that the Helmut, et al. study noted one procedure related perforation which required surgical repair and we invite public comments regarding the concern of procedure related perforation.

We are inviting public comments on whether the Pure-Vu® System meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for the Pure-Vu® System.

o. Rapid ASPECTS

iSchemaView (which is in the process of a name change to RapidAI) submitted an application for new technology add-on payments for Rapid ASPECTS for FY 2022. According to the applicant, Rapid ASPECTS is a computer-aided diagnosis (CADx) software device used to assist the clinician in the assessment and characterization of brain tissue abnormalities using computed tomography (CT) image data. The applicant asserted that the software automatically registers images and segments and analyzes ASPECTS Regions of Interest (ROIs). According to the applicant, Rapid ASPECTS extracts image data for the ROI(s) to provide analysis and computer analytics based on morphological characteristics. The applicant stated that the imaging features are then synthesized by an artificial intelligence algorithm into a single ASPECT Score.

The applicant stated Rapid ASPECTS is indicated for evaluation of patients presenting for diagnostic imaging workup with known Middle Cerebral Artery (MCA) or Internal Carotid Artery (ICA) occlusion, for evaluation of extent of disease. The applicant stated that extent of disease refers to the number of ASPECTS regions affected, which is reflected in the total score.

According to the applicant, the Rapid ASPECTS device provides information that may be useful in the

characterization of early ischemic brain tissue injury during image interpretation (within 6 hours). The applicant stated Rapid ASPECTS provides a comparative analysis to the ASPECTS standard of care radiologist assessment using the ASPECTS atlas definitions and atlas display including highlighted ROIs and numerical scoring. The applicant stated that Rapid ASPECTS is not intended for primary interpretation of CT images; it is used to assist physician evaluation. The applicant asserted Rapid ASPECTS has been validated in patients with known MCA or ICA occlusion prior to ASPECT scoring.

According to the applicant, when patients with a suspected stroke arrive at an emergency department, they are rapidly triaged to the CT scanner for a non-contrast CT (NCCT) and CT angiography (CTA). The applicant stated that CTA directly images large vessel occlusions and the NCCT can exclude brain hemorrhage and identify early signs of brain infarction. The applicant asserted that automated large vessel occlusion (LVO) detection software is now used at many sites to quickly identify LVOs on CTA and provide physicians with early notification that an LVO has been identified. The applicant stated that following identification of an LVO, the next imaging evaluation required is for a physician, typically a radiologist or neuroradiologist, to determine the ASPECT score by taking a close look at the NCCT for evidence of early infarct signs. The applicant stated that patients with an ASPECT score between 6 and 10 who meet clinical criteria for thrombectomy should receive thrombectomy as soon as possible, if treatment can occur within 6 hours of symptoms onset. The applicant asserted that for patients who present beyond 6 hours, a CT perfusion or MRI scan are required to identify which patients are eligible for thrombectomy.

The applicant stated approximately 800,000 primary (first-time) or secondary (recurrent) strokes occur each year in the U.S., with the majority being primary strokes (roughly 600,000). Of these strokes, approximately 87% are ischemic infarctions, 10% are primary hemorrhages, and 3% are subarachnoid hemorrhage.[520] According to the applicant, the incidence of stroke rapidly increases with age, doubling for each decade after age 55. The applicant asserted that among adults ages 35 to 44, the incidence of stroke is 30 to 120 in 100,000 per year, and for those ages 65 to 74, the incidence is 670 to 970 in 100,000 per year. Therefore, according to the applicant, the primary burden of stroke affects the Medicare-age population. The applicant stated the most disabling strokes are those due to large vessel occlusions (LVOs), and treatment of these strokes has the largest therapeutic benefits.[521]

The applicant stated that Rapid ASPECTS received FDA 510(k) clearance as a CADx software device on June 26, 2020 and provided a date of first installation of September 1, 2020. The applicant described Rapid ASPECTS as a machine learning-based automated software for assessment of ASPECTS. The applicant asserted that Rapid ASPECTS remains the only cleared ASPECTS software and the only stroke imaging software to receive a CADx clearance by the FDA. The legally marketed predicate device that Rapid ASPECTS is substantially equivalent to, per FDA, is QuantX,[522] which was granted De Novo authorization on July 19, 2017. QuantX is a CADx software device used to assist radiologists in the assessment and characterization of breast abnormalities using magnetic resonance (MR) image data and is indicated for evaluation of patients presenting for high-risk screening, diagnostic imaging workup, or evaluation of extent of known disease.[523]

We note the applicant submitted a request for approval of a unique ICD–10–PCS procedure code to identify use of the technology beginning FY 2022. According to the applicant, this new ICD–10–PCS code would be reported in addition to the non-contrast CT using the appropriate code as listed in current coding systems.

As discussed previously, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome, the applicant asserted Rapid ASPECTS uses a new mechanism of action (machine learning) to assess CT scans and synthesize a single ASPECT score when compared to existing options which are limited to clinical assessment by a human reader. According to the applicant, this software remains the only FDA-cleared ASPECTS software and the only stroke imaging software to receive a CADx clearance by the FDA. The applicant asserted Rapid ASPECTS is fully automated and produces a score for each of the 10 ASPECTS regions, as well as a total score in approximately 2 minutes.

With regard to the second criterion, whether the technology is assigned to the same or a different MS–DRG, the applicant stated that cases involving Rapid ASPECTS would be assigned to the same MS–DRGs as cases involving patients confirmed with an eligible LVO by a positive CTA. According to the applicant, in these cases, the traditional clinical pathway requires a physician to determine the ASPECT score through an imaging evaluation. The applicant noted that Rapid ASPECTS may result in patients being assigned to a different MS–DRG depending on whether or not a mechanical thrombectomy is performed as a result of the Rapid ASPECTS results.

With regard to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant asserted Rapid ASPECTS addresses the current stroke population.

In summary, the applicant believes that Rapid ASPECTS is not substantially similar to other currently available therapies because Rapid ASPECTS uses a new mechanism of action (machine learning) to assess CT scans and synthesize a single ASPECT score. We are unclear as to whether machine learning to assess CT scans and synthesize a single ASPECT score would represent a unique mechanism of action, or how the mechanism of action by which Rapid ASPECTS assesses stroke imaging is distinct from other automated stroke imaging analysis tools, or the traditional hospital workflow.

We continue to be interested in public comments regarding issues related to determining newness for technologies that use AI, an algorithm or software, as discussed in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58628). Specifically, we are interested in public comment on how these technologies, including devices classified as radiological computer aided triage and notification software and radiological computer-assisted diagnostic software, may be considered for the purpose of identifying a unique mechanism of

[520] Ovbiagele B, et al. Stroke Epidemiology: Advancing Our Understanding of Disease Mechanism and Therapy *Neurotherapeutics.* (2011) 8:319–329.

[521] Ovbiagele B, et al. Stroke Epidemiology: Advancing Our Understanding of Disease Mechanism and Therapy *Neurotherapeutics.* (2011) 8:319–329.

[522] Rapid ASPECTS 510(k) clearance letter from FDA: *https://www.accessdata.fda.gov/cdrh_docs/pdf20/K200760.pdf.*

[523] QuantX De Novo decision summary from FDA: *https://www.accessdata.fda.gov/cdrh_docs/reviews/DEN170022.pdf.*

action; how updates to AI, an algorithm or software would affect an already approved technology or a competing technology; whether software changes for an already approved technology could be considered a new mechanism of action, and whether an improved algorithm by competing technologies would represent a unique mechanism of action if the outcome is the same as an already approved AI new technology.

We invite public comments on whether Rapid ASPECTS is substantially similar to existing technologies, including specifically with respect to the mechanism of action, and whether it meets the newness criterion.

With respect to the cost criterion, the applicant provided three analyses: (1) A baseline analysis containing all cases reporting one of the targeted ICD–10–CM codes below as the principal diagnosis code for cerebral infarction that map to one of the applicant's targeted MS–DRGs; (2) an analysis limited to MS–DRGs with a case volume over 100; and (3) an analysis limited to MS–DRGs 023, 062, 064, 065, and 066, which per the applicant would reflect 80 percent of all stays. For the baseline analysis, the applicant first extracted all inpatient stays from the CY 2018 Limited Data Set Standard Analytic File (LDS SAF) that contained a principal ICD–10–CM diagnosis code for cerebral infarction. The applicant used the following ICD–10–CM diagnosis codes.

An Inpatient Stay Must Have At Least One Of The Listed Cerebral Infarction Diagnosis Codes As A Principal Diagnosis Code To Be Included In The Analysis	
ICD-10-CM Code	**Description**
Cerebral Arteries	
I63.311	Cerebral infarction due to thrombosis of right middle cerebral artery
I63.312	Cerebral infarction due to thrombosis of left middle cerebral artery
I63.313	Cerebral infarction due to thrombosis of bilateral middle cerebral arteries
I63.319	Cerebral infarction due to thrombosis of unspecified middle cerebral artery (NOTE: Not a legitimate billing code)
I63.321	Cerebral infarction due to thrombosis of right anterior cerebral artery
I63.322	Cerebral infarction due to thrombosis of left anterior cerebral artery
I63.323	Cerebral infarction due to thrombosis of bilateral anterior cerebral arteries
I63.329	Cerebral infarction due to thrombosis of unspecified anterior cerebral artery (NOTE: Not a legitimate billing code)
I63.331	Cerebral infarction due to thrombosis of right posterior cerebral artery
I63.332	Cerebral infarction due to thrombosis of left posterior cerebral artery
I63.333	Cerebral infarction due to thrombosis of bilateral posterior cerebral arteries
I63.411	Cerebral infarction due to embolism of right middle cerebral artery
I63.412	Cerebral infarction due to embolism of left middle cerebral artery
I63.413	Cerebral infarction due to embolism of bilateral middle cerebral arteries
I63.421	Cerebral infarction due to embolism of right anterior cerebral artery
I63.422	Cerebral infarction due to embolism of left anterior cerebral artery
I63.423	Cerebral infarction due to embolism of bilateral anterior cerebral arteries
I63.431	Cerebral infarction due to embolism of right posterior cerebral artery
I63.432	Cerebral infarction due to embolism of left posterior cerebral artery
I63.433	Cerebral infarction due to embolism of bilateral posterior cerebral arteries
I63.442	Cerebral infarction due to embolism of left cerebellar artery
I63.511	Cerebral infarction due to unspecified occlusion or stenosis of right middle cerebral artery
I63.512	Cerebral infarction due to unspecified occlusion or stenosis of left middle cerebral artery
I63.513	Cerebral infarction due to unspecified occlusion or stenosis of bilateral middle cerebral arteries
I63.521	Cerebral infarction due to unspecified occlusion or stenosis of right anterior cerebral artery
I63.522	Cerebral infarction due to unspecified occlusion or stenosis of left anterior cerebral artery
I63.523	Cerebral infarction due to unspecified occlusion or stenosis of bilateral anterior cerebral arteries
I63.531	Cerebral infarction due to unspecified occlusion or stenosis of right posterior cerebral artery
I63.532	Cerebral infarction due to unspecified occlusion or stenosis of left posterior cerebral artery
I63.533	Cerebral infarction due to unspecified occlusion or stenosis of posterior cerebral arteries
I66.01	Occlusion and stenosis of right middle cerebral artery not resulting in cerebral infarction
I66.02	Occlusion and stenosis of left middle cerebral artery not resulting in cerebral infarction

I66.03	Occlusion and stenosis of bilateral middle cerebral arteries
I66.11	Occlusion and stenosis of right anterior cerebral artery not resulting in cerebral infarction
I66.12	Occlusion and stenosis of left anterior cerebral artery not resulting in cerebral infarction
I66.13	Occlusion and stenosis of bilateral anterior cerebral arteries not resulting in cerebral infarction
I66.21	Occlusion and stenosis of right posterior cerebral artery, not resulting in cerebral infarction
I66.22	Occlusion and stenosis of left posterior cerebral artery, not resulting in cerebral infarction
I66.23	Occlusion and stenosis of bilateral posterior cerebral arteries
I66.3	Occlusion and stenosis of cerebellar arteries not resulting in cerebral infarction not resulting in cerebral infarction
I66.8	Occlusion and stenosis of other cerebral arteries not resulting in cerebral infarction
I67.1	Cerebral aneurysm. Nonruptured
I67.2	Cerebral atherosclerosis

The applicant then removed cases for hospitals that are not paid under the IPPS. The applicant also removed inpatient stays and their assigned MS–DRGs from its analysis where the assigned MS–DRG met any of the following conditions: (1) The MS–DRG is for a part of the body not related to the head; (2) the MS–DRG is a psychiatric MS–DRG, alcohol-related MS–DRG, or a catchall MS–DRG; (3) the MS–DRG has a very small number of cases; or (4) the MS–DRG is unlikely to involve an LVO. The applicant identified 66,990 cases mapping to 27 MS–DRGs, as listed in the following table, in descending order by volume:

MS-DRG	MS-DRG Title
065	Intracranial Hemorrhage or Cerebral Infarction w CC or TPA in 24 Hrs
064	Intracranial Hemorrhage or Cerebral Infarction w MCC
023	Craniotomy w Major Device Implant or Acute CNS Pdx w MCC or Chemotherapy Implant or Epilepsy w Neurostimulator
066	Intracranial Hemorrhage or Cerebral Infarction w/o CC/MCC
062	Ischemic Stroke, Precerebral Occlusion or Transient Ischemia w Thrombolytic Agent w CC
024	Cranio w Major Dev Impl/Acute Complex CNS Pdx w/o MCC
061	Ischemic Stroke, Precerebral Occlusion or Transient Ischemia w Thrombolytic Agent w MCC
027	Craniotomy & Endovascular Intracranial Procedures w/o CC/MCC
026	Craniotomy & Endovascular Intracranial Procedures w CC
025	Craniotomy & Endovascular Intracranial Procedures w MCC
063	Ischemic Stroke, Precerebral Occlusion or Transient Ischemia w Thrombolytic Agent w/o CC/ MCC
068	Nonspecific CVA & Precerebral Occlusion w/o Infarct w/o MCC
038	Extracranial Procedures w CC
003	Ecmo or Trach w MV >96 Hrs or Pdx Exc Face, Mouth & Neck w Maj O.R.
037	Extracranial Procedures w MCC
093	Other Disorders of Nervous System w/o CC/MCC
092	Other Disorders of Nervous System w CC
004	Trach w MV >96 Hrs or Pdx Exc Face, Mouth & Neck w/oMaj O.R.
091	Other Disorders of Nervous System w MCC
034	Carotid Artery Stent Procedure w MCC
035	Carotid Artery Stent Procedure w CC
039	Extracranial Procedures w/o CC/MCC
071	Nonspecific Cerebrovascular Disorders w CC
067	Nonspecific CVA & Precerebral Occlusion w/o Infarct w MCC
070	Nonspecific Cerebrovascular Disorders w MCC
036	Carotid Artery Stent Procedure w/o CC/MCC
072	Nonspecific Cerebrovascular Disorders w/o CC/MCC

The applicant then standardized the charges and applied the 2-year charge inflation factor of 13.2 percent used to adjust the outlier threshold determination (85 FR 59039). The applicant did not remove charges for prior technology, as the applicant believes Rapid ASPECTS does not eliminate or replace any prior technology or services. The applicant also noted that it did not remove charges related to the prior technology, as the applicant believes Rapid ASPECTS does not reduce costs during the inpatient stay.

The applicant then added charges for the technology. The applicant stated that it estimated the cost per case of Rapid ASPECTS using historical utilization data gathered from its Rapid CTA module. The applicant anticipates Rapid ASPECTS will be used in the same hospital sites as Rapid CTA, which also provides the applicant with a baseline number of Medicare and non-Medicare patients who were identified with a suspected LVO. The applicant estimated that approximately 20.5 percent of all patients who received a RAPID CTA scan qualified as inpatients eligible for a Rapid ASPECTS scan. The applicant divided the total number of qualified Medicare and non-Medicare inpatients by the total number of subscriber hospitals to arrive at an average number of inpatients eligible to be scanned with Rapid ASPECTS per subscriber hospital per year. The applicant then took the estimated average sales price per annual contract of Rapid ASPECTS per hospital and divided it across the estimated annual number of Rapid ASPECTS inpatients per site to estimate the average cost per case per subscriber hospital. Finally, the applicant divided the average cost per case by the national average CCR for radiology of 0.136 (85 FR 58601).

The applicant calculated a case-weighted threshold amount of $76,398 and a final inflated average case-weighted standardized charge per case of $90,097. Based on this analysis, the applicant asserted that Rapid ASPECTS meets the cost criterion because the final inflated average case-weighted standardized charge per case exceeds the case-weighted threshold amount. The applicant submitted two additional scenarios to demonstrate that the technology meets the cost criterion using the same methodology described but with limits on the cases. The first scenario limited the analysis to MS–DRGs with at least 100 cases. This resulted in a case-weighted threshold of $76,457 and a final inflated average case weighted standardized charge per case of $90,172. The second scenario limited the analysis to MS–DRGs 023, 062, 064, 065, and 066, which per the applicant reflect 80 percent of all stays. This second alternative method resulted in a case-weighted threshold of $67,890 and a final inflated average case-weighted standardized charge per case of $77,614. Across all three analyses, the applicant maintained that the technology meets the cost criterion because the final inflated average case-weighted standardized charge per case exceeds the average case-weighted threshold amount.

We note the following concerns regarding the cost analysis for Rapid ASPECTS. The applicant stated it removed from its analysis those cases and their assigned MS–DRG where the assigned MS–DRG was for a body part that is not the head; however the list of MS–DRGs the applicant presented included MS–DRGs 37 (Extracranial Procedures w/MCC) and 38 (Extracranial Procedures w/CC), which by definition describe procedures outside of the head. We would like to understand why these MS–DRGs and their assigned cases were included in the baseline analysis. We would also like to understand the time period of the claims the applicant selected from the CY 2018 SAF, as this could have implications for the inflation factor used to update charges if the applicant selected claims from FY 2018 as opposed to FY 2019.

The applicant appears to have used a single list price of Rapid ASPECTS per hospital with a cost per patient that can vary based on the volume of cases. We note that the cost per patient varies based on the utilization of the technology by the hospitals. The cost per patient could be skewed by the small number of hospitals utilizing the technology and their low case volumes. It is possible, if hospitals with large patient populations adopt Rapid ASPECTS, the cost per patient would be significantly lower.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58630), we stated our understanding that there are unique circumstances to determining a cost per case for a technology that utilizes a subscription for its cost. We stated our intent to continue to consider the issues relating to the calculation of the cost per unit of technologies sold on a subscription basis as we gain more experience in this area. We continue to welcome comments from the public as to the appropriate method to determine a cost per case for such technologies, including comments on whether the cost per case should be estimated based on subscriber hospital data as described previously, and if so, whether the cost analysis should be updated based on the most recent subscriber data for each year for which the technology may be eligible for the new technology add-on payment.

We invite public comment on whether Rapid ASPECTS meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted Rapid ASPECTS represents a substantial clinical improvement over existing technologies because it improves diagnostic decisions by improving accuracy of ASPECT scoring. The applicant also asserted it improves diagnostic decisions by reducing inter-rater variability of ASPECT scoring. The applicant also asserted it represents a substantial clinical improvement by improving treatment decisions and by improving time to treatment.

According to the applicant, the first stroke treatment, tissue plasminogen activator (tPA), was first approved in the United States for intravenous administration to patients with acute stroke in 1996, and a study demonstrating successful catheter-directed intra-arterial infusion of a thrombolytic agent for this indication was first published in 1999.[524] The applicant asserted that the first positive randomized controlled studies using modern mechanical thrombectomy devices for LVO stroke were published in 2015 and support combined treatment with tPA and catheter-based thrombectomy as the most effective treatment approach for patients who can be treated within six hours of symptom onset.[525] According to the applicant, following the publication of these trials, the American Heart Association (AHA) and American Stroke Association (ASA) released new guidelines in 2016, 2018 and 2019 that all specified the following Level 1A recommendation:

Patients should receive mechanical thrombectomy with a stent retriever if they meet all the following criteria:

- Pre-stroke modified Rankin Score (mRS) score of 0 to 1.
- Causative occlusion of the internal carotid artery (ICA) or middle cerebral artery (MCA) segment 1 (M1).
- Age ≥18 years.
- NIH Stroke Scale (NIHSS) score of ≥6.
- Alberta stroke program early CT score (ASPECTS) of ≥6.
- Treatment can be initiated (groin puncture) within 6 hours of symptom onset.[526]

According to the applicant, the above-recommended guidelines from the

[525] Goyal M, Menon BK, et al for the HERMES collaborators. Endovascular thrombectomy after large-vessel ischaemic stroke: a meta-analysis of individual patient data from five randomised trials. *Lancet* 2016; 387: 1723–31.

[526] Powers WJ, Rabinstein A, Ackerson T, et al. Guidelines for the Early Management of Patients With Acute Ischemic Stroke: 2019 Update to the 2018 Guidelines for the Early Management of Acute Ischemic Stroke A Guideline for Healthcare Professionals From the American Heart Association/American Stroke Association. *Stroke.* 2019;50:e344–e418.

AHA/ASA have been widely accepted and outline the key requirements that are still used today to select early window (less than 6 hours) candidates for thrombectomy. The applicant asserted the imaging requirements (the second and the fifth criterion) require that patients be screened for an LVO with CTA and then once an LVO in the ICA or MCA is discovered, the ASPECTS score must be assessed to verify that it is 6 or higher. According to the applicant, the ASPECTS score is an assessment of the CT scan in a stroke patient to determine if there is evidence of irreversible injury in ten different brain regions. The applicant stated that patients who have more than five regions that are already irreversibly injured are not candidates for thrombectomy.

According to the applicant, it is well validated in the stroke literature that faster treatment leads to better outcomes. The applicant stated that compared with the best medical therapy alone, in the first five positive LVO endovascular thrombectomy trials that were published in the *New England Journal of Medicine* and subsequently summarized in a pooled analysis by the HERMES group, thrombectomy was associated with improved outcomes when procedure start (arterial puncture) could be performed within the first 7.3 hours after symptom onset among patients meeting the brain imaging entry criteria for inclusion in these randomized trials.[527] The applicant asserted that within this period, functional outcomes were better the sooner after symptom onset that endovascular reperfusion was achieved, emphasizing the importance of programs to enhance patient awareness, out-of-hospital care, and in-hospital management to shorten symptom onset-to-treatment times. The applicant asserted that the magnitude of the association between time to treatment and outcome is clinically meaningful. According to the applicant, in patients with acute ischemic stroke due to LVO, among every 1000 patients achieving substantial endovascular reperfusion, for every 15-minutes faster emergency department door-to-reperfusion time, an estimated 39 patients would have a less-disabled outcome at 3 months, including 25 more who would achieve functional independence (mRS 0–2).[528] The applicant stated that in addition to faster time from emergency department door to reperfusion, faster time from brain imaging to reperfusion was associated with better 3-month functional outcomes.[529]

According to the applicant, the interpretation of early infarct signs in CT first became clinically important following the FDA approval of tPA for stroke treatment in 1996 because it was shown that the response to tPA could be predicted based on the degree of early brain injury that could be visualized on the CT scan. The applicant asserted it was clear that intravenous tPA could be harmful in patients with advanced early infarct signs because they had a high risk of intracranial hemorrhage. The applicant stated, however, only rough qualitative estimates of the degree of early infarct signs were performed. The applicant asserted stroke clinicians generally felt safe to give tPA if the early infarct signs were confined to less than one-third of the middle cerebral artery territory.[530]

According to the applicant, beginning in the 2000s, a more detailed and quantitative analysis of early infarct signs was proposed: The Alberta Stroke Program Early CT score (ASPECTS).[531] The applicant stated this score requires the evaluation of 10 pre-defined MCA vascular territories. The applicant asserted these individual regions are assessed for focal hypoattenuation of the cortex and in the basal ganglia, reduction of gray and white matter differentiation, and the loss of the insular ribbon sign. According to the applicant, ASPECTS is calculated by subtracting 1 point for each involved region; scores less than 6 typically signify patients with an irreversible large hemispheric infarction.[532]

According to the applicant, the ASPECTS evaluation became clinically essential in 2015 after mechanical thrombectomy was found to be effective for treatment of patients with a large vessel occlusion within the 6-hour time frame.[533] [534] The applicant stated that some of the large randomized controlled trials that ultimately led to the establishment of thrombectomy as a standard procedure required an ASPECTS greater than or equal to 6 for inclusion. According to the applicant, the MR CLEAN trial, which enrolled patients with lower ASPECT scores than the other four trials, reported the smallest overall treatment effect and in particular, patients with an ASPECT score less than 5 did not show benefit with an adjusted odds ratio close to 1.0.[535] The applicant asserted that for these reasons, an ASPECTS evaluation is required in most national and international thrombectomy guidelines. The applicant stated most guidelines, including the AHA/ASA guidelines discussed above, require an ASPECT score greater than or equal to six 6 for a patient to qualify for thrombectomy in the early treatment window.[536]

The applicant asserted ASPECT score determination is challenging because early infarct signs are often very subtle and challenging to interpret correctly. According to the applicant, there is often disagreement between experts on the exact score and sometimes these disagreements preclude a definite answer regarding if the patient qualifies for thrombectomy or not. The applicant asserted these interpretation challenges are manifested by limited inter-rater

[527] Goyal M, Menon BK, et al for the HERMES collaborators. Endovascular thrombectomy after large-vessel ischaemic stroke: a meta-analysis of individual patient data from five randomised trials. *Lancet* 2016; 387: 1723–31.

agreement, even among experts.[537] [538] [539] The applicant cited the DEFUSE 2 study in which two expert readers graded ischemic change on NCCT using the ASPECT score. The applicant asserted that full-scale agreement (measured by the intraclass correlation coefficient) for CT–ASPECTS was only moderate at 0.579.[540] According to the applicant, these inter-rater differences can have important clinical implications, as discussed further. The applicant asserted that many physicians who evaluate acute stroke patients are not confident that they can accurately determine an ASPECT score, and oftentimes there are significant delays before a radiologist reads the scan.

The applicant stated current AHA/ASA guidelines recommend a CT scan be performed within 25 minutes of Emergency Department arrival and the radiologist interpretation of the scan occur within 45 minutes of arrival.[541] According to the applicant, based on these guidelines, radiologists have about 20 minutes to read the scan, however, many hospitals, especially community and primary stroke centers, do not meet these guidelines. The applicant asserted Medicare data indicate that only 72% of patients meet these guidelines. The applicant stated that automated software, such as Rapid ICH, Rapid LVO and Rapid ASPECTS can assess CT and CTA findings (both to rule out hemorrhage, confirm an LVO and to assess early signs of infarction with ASPECTS) within minutes.

According to the applicant, the limited inter-rater agreement for traditional ASPECT scoring can lead to triaging ineligible patients to thrombectomy or failing to treat eligible patients. The applicant cited a study in which four experienced readers rated ASPECT scores in patients who presented with LVO and severe strokes. The applicant stated the inter-rater agreement between these raters was poor with an interclass correlation of 0.32.[542] According to the applicant, the range of agreement for individual raters with the gold standard assessment of the score (obtained with a concurrent MRI) for identifying patients with a score less than six 6 ranged from 35% to 94%. The applicant asserted this study demonstrates there can be substantial disagreement between physicians regarding if a patient is eligible for thrombectomy based on their assessment of the ASPECT score, which can lead to eligible patients not receiving this highly effective therapy, as well as the performance of unnecessary procedures.

The applicant asserted that particularly the Medicare population might be at risk and impacted by these limitations as the majority of LVOs occur in the Medicare population. The applicant stated that the average age of patients in the HERMES pooled analysis of thrombectomy studies was 68 years.[543] Therefore, according to the applicant, inaccuracy of traditional ASPECT scoring translates into a substantial percentage of Medicare patients having erroneous triage decisions made regarding their eligibility for thrombectomy, which it asserted can result in unnecessary procedures and increased Medicare costs, as well as increased disability in eligible patients who are not treated because of inaccurate ASPECT scoring.

As stated previously, the applicant asserted Rapid ASPECTS represents a substantial clinical improvement over existing technologies because it improves diagnostic decisions by improving accuracy of ASPECT scoring. The applicant presented three retrospective cohort studies (two peer-reviewed and one under review) to support the claim that diagnostic decisions made by clinicians would have been improved with use of Rapid ASPECTS. According to the applicant, two of the studies showed that the automated Rapid ASPECTS score is significantly more accurate than the scores obtained by experienced clinicians.[544] [545]

The applicant submitted a retrospective cohort study which compared ASPECT scoring of CT images from patients with MCA occlusion (n=100) between Rapid ASPECTS software and two expert neuroradiologist reads. According to the applicant, Rapid ASPECTS showed a substantial agreement (k=0.78) when imaging took place more than 1 hour after symptom onset, which increased to high agreement (k=0.92) for imaging occurring after 4 hours. The applicant asserted that the neuroradiologist raters did not achieve comparable results to the software until the time interval of greater than 4 hours (k=0.83 and k=0.76). In this study, experts developed the reference consensus score and then, after 6 weeks, the same two neuroradiologists again determined ASPECTS by using only the baseline CT. The experts had moderate agreement with the consensus score (k=0.57 and k=0.57) while Rapid ASPECTS had better agreement (k=0.9). There was minimal agreement across experts and software in the timeframe of less than 1 hour between symptom onset and imaging, but better software agreement when the time was between 1 and 4 hours. There was agreement across experts for imaging occurring after 4 hours. According to the applicant, this study showed that in acute stroke of the MCA, Rapid ASPECTS had better agreement than that of human readers with a predefined consensus score.[546]

The applicant submitted another retrospective cohort study to compare Rapid ASPECTS, as well as the mean score from four experienced readers, with a diffusion-weighted magnetic resonance imaging (DW–MRI) ASPECTS obtained following the baseline CT in patients (n=65) with large hemispheric infarcts.[547] DW–MRI is sensitive in the detection of small and early infarcts. Small infarcts might not appear on CT scans for days. The AHA/ASA guidelines state that DW–MRI can be useful for selecting candidates for mechanical thrombectomy between 6 and 24 hours after the patient was last known well (that is, the time at which the patient was known to be without signs and symptoms of the current stroke).[548]

According to the applicant, Rapid ASPECTS' automated score had a higher level of agreement with the mean of the DW–MRI ASPECTS, both for the full scale and for the dichotomized scale of either <6 or ≥6 which is the difference for treatment/no treatment (difference in intraclass correlation coefficient, p<0.001). The applicant stated that the mean DW–MRI ASPECT score was <6 in 63/65 (97%) of the cases; of these, RAPID ASPECTS agreed with the DW–MRI score in 46/63 (73%) of the cases (95% confidence interval [CI] 60–83%) vs. 35/63 56% of the cases (95% CI 44–69%) for the median score of the two experienced readers (p=0.027). The range of agreement for individual clinician CT ASPECTS with the median DW–MRI score for identifying patients with a score <6 was 35% to 94%. According to the applicant, this study demonstrated the accuracy for determining which patients have an ASPECTS <6 (which would exclude them from thrombectomy) was significantly higher with the software.[549]

The applicant submitted an additional retrospective cohort study under review for publication which compared physicians' (two expert neuroradiologists and six typical readers) ability to read ASPECTS in patients with an LVO (n=50; 10 regions in each patients' scan for a total of 500 individual regions) within 6 hours of symptom onset when assisted by Rapid ASPECTS, compared with their unassisted score. The applicant stated that the average ASPECT score of three additional experienced neuroradiologists who were provided access to a follow-up MRI was used as the reference standard. The applicant asserted that when typical readers read the scan in conjunction with the Rapid ASPECTS software, their agreement with the expert reads improved from 72% to 78% (p<0.0001, test of proportions). According to the applicant, Rapid ASPECTS alone achieved correlations for total ASPECT scores that were similar to the three experienced neuroradiologist readers who had access to a follow-up MRI scan to help enhance the quality of their reads. The applicant asserted the results from this study showed that the aid of Rapid ASPECTS can significantly improve typical readers' scores and that the automated scores generated by Rapid ASPECTS are interchangeable with the scores generated by expert neuroradiologists.[550]

As stated previously, the applicant asserted Rapid ASPECTS represents a substantial clinical improvement over existing technologies because it improves diagnostic decisions by reducing inter-rater variability of ASPECT scoring. To support this claim the applicant submitted the study performed by iSchemaView and analyzed by an independent statistician that led to the FDA clearance of Rapid ASPECTS. According to the applicant, acute CT scans in patients with LVO (n=50) were read by eight readers both with and without Rapid ASPECTS. The applicant asserted that the standard deviation of ASPECT scores ranged from 0.35 to 4.5 without assistance as compared to 0.46 to 4.7 with assistance. The applicant stated that the median standard deviation dropped from 2.2 to 1.4 when assistance was used to read the scans. According to the applicant, a t-test to evaluate the hypothesis of equal standard deviations supported a significant difference in standard deviations (p=0.0002), and non-parametric tests arrived at the same conclusion (p<0.0001 for a Wilcoxon Rank Sum Test).[551]

As stated previously, the applicant asserted Rapid ASPECTS represents a substantial clinical improvement by improving treatment decisions and by improving time to treatment. The applicant asserted that in the study performed by iSchemaView of the acute CT scans in patients with LVO (n=50) which were read by eight readers both with and without Rapid ASPECTS, a Receiver Operating Characteristic (ROC) analysis demonstrated significant improvement in typical readers' ability to identify patients who have a score of 6 to 10 if they read the scan in conjunction with the automated score. According to the applicant, the area under the curve (AUC) improved from 0.78 without Rapid ASPECTS to 0.85 with Rapid ASPECTS (p=0.0049).

The applicant asserted that of the 400 treatment assessments (50 scans * 8 readers) in this study, 7% were changed from an incorrect assessment to a correct assessment when the scan was read in conjunction with the automated score compared with traditional scoring, a statistically significant difference.[552]

The applicant cited three retrospective studies that, according to the applicant, have shown treatment decisions made by experienced clinicians would have been improved with the use of Rapid ASPECTS.[553] [554] [555] As stated previously, the applicant asserted that one study showed that agreement regarding whether a patient had a treatment-eligible score based on a concurrent MRI scan interpreted by two experts was significantly higher for the Rapid ASPECTS score than for experienced clinicians.[556] According to the applicant, Rapid ASPECTS has also been shown to improve the reads of a typical CT scan reader to become as accurate as a neuroradiologist read.[557] The applicant asserted that since radiologists are not immediately available at the time when many LVO patients present, and obtaining a read from a neuroradiologist often takes even longer, the time to determine an ASPECT score will be substantially improved with the software, leading to faster treatment times which have been shown to reduce disability. According to the applicant, Rapid ASPECTS provides an opportunity to impact the current selection and allocation pathway for stroke care.

After reviewing the information submitted by the applicant, we have the following questions regarding whether Rapid ASPECTS meets the substantial clinical improvement criterion.

In the studies provided by the applicant, the reference ASPECT score to which Rapid ASPECTS was compared was generally derived from a mean value of the ASPECT scores rated from a small sample of expert radiologists. We note that the radiologists used to identify the reference to which Rapid ASPECTS was compared may not be representative of radiologists in the United States. We are also unclear whether a mean ASPECT score, identified from radiologists whom

[556] Albers GW, MD, Wald MJ, Mlynash M, et al. Automated Calculation of Alberta Stroke Program Early CT Score Validation in Patients With Large Hemispheric Infarct. *Stroke.* 2019;50:3277–3279.

[557] Delio PR, Wong ML, Tsai JP, et al. Assistance from Automated ASPECTS Software Improves Reader Performance (under review 2020).

the applicant describes as having low levels of agreement, is representative of a meaningful value as it does not represent the score of any particular radiologist. We further question whether individuals participating in these studies may have altered their behavior in a substantive way by interacting with computer-generated ratings, which would complicate study findings.

We further note that the correlation between the ASPECT scoring of expert and Rapid ASPECTS is the primary outcome in many of the articles provided. Though this information may be important and informative, it is not clear that a high correlation between expert and Rapid ASPECTS scoring is necessarily indicative of substantial clinical improvement. Furthermore, whether these providers agree with the technology does not determine whether they are correct, and it could be the case that both AI and radiologists agree on an incorrect score.

We note that the applicant stated that inter-rater disagreement with ASPECT scores leads to erroneous triage and treatment of Medicare patients. It is unclear how the applicant determined that disagreement between scores translates into inappropriate treatment, or necessarily shows that the scoring class (<6 vs ≥6) was inaccurate. The applicant also asserted that many physicians who evaluate acute stroke patients are not confident that they can accurately determine an ASPECT score, but it did not provide evidence to support this claim. Additionally, we observe that the studies provided did not demonstrate improvements in clinical outcomes such as disability, mortality, or length of stay; rather, improved outcomes were inferred by relying on the assumption that faster treatment results in better outcomes. Without measuring the impact of the technology on treatment outcomes, we are uncertain whether Rapid ASPECTS represents a substantial clinical improvement.

Lastly, we note that the applicant submitted the AHA/ASA guidelines and a review of stroke literature as support for clinical improvement. It is unclear how the guidelines support a finding of substantial clinical improvement for Rapid ASPECTS because the guidelines are for the current standard of care. Additionally, the applicant did not provide evidence to support its assertion that hospitals are not meeting the AHA/ASA guideline that radiologists read the CT scan of acute ischemic stroke patients within 20 minutes. The stroke literature review identified the inter-rater differences among ASPECT scoring, but did not demonstrate that inter-rater disagreements have led to triaging ineligible patients to thrombectomy or failing to treat eligible patients in clinical practice. It is unclear how the literature on inter-rater reliability for ASPECT scoring would demonstrate a substantial clinical improvement in how Rapid ASPECTS supports improved triaging of stroke care. The applicant's stroke literature review also identified that faster treatment leads to better outcomes. While this supports the urgency of stroke care, we are unsure how it demonstrates a substantial clinical improvement in how Rapid ASPECTS supports the urgency of stroke care.

We are inviting public comments on whether Rapid ASPECTS meets the substantial clinical improvement criterion.

In this section, we summarize and respond to written public comments received in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for Rapid ASPECTS.

Comment: Several commenters, some of whom participated in one of the retrospective studies assessing Rapid ASPECTS, asserted that Rapid ASPECTS offers a substantial clinical improvement over the current standard of care for evaluation and treatment of patients diagnosed with LVO. They cited the studies summarized in this section and their clinical experience with Rapid ASPECTS and stated that Rapid ASPECTS improves treatment decisions by improving the accuracy of the assessment of candidates eligible for thrombectomy as well as reducing the time to appropriate treatment, which leads to better outcomes.

Response: We thank the commenters for their input and will take this information into consideration when deciding whether to approve new technology add-on payments for Rapid ASPECTS.

Comment: The applicant responded to the questions received at the New Technology Town Hall Meeting held in December 2020.

First, the applicant was asked if an ROC analysis had been performed with Rapid ASPECTS. The applicant stated that an ROC analysis had been performed for one of the retrospective studies assessing Rapid ASPECTS (Delio et al., 2020, under review). According to the applicant, using the scores for the 500 ASPECT regions for all 8 readers shows the AUC improved from 0.78 without RAPID to 0.85 with RAPID-assisted reads. The applicant stated the reference standard was the read from three experienced neuroradiologists who were provided access to a follow-up MRI scan to help enhance the accurary of the reference standard. The applicant asserted that the difference of 0.06 between the AUCs is statistically significant (p=0.0049).

Second, the applicant was asked if clinical benefits of RAPID Aspects were directly observed in prospective studies using the Rapid ASPECTS software. The applicant cited a recent retrospective study reporting a series of 176 patients from one hospital in Alexandria, Egypt diagnosed with Acute Ischemic Stroke (AIS) and subsequently treated with tPA between January 2018 and December 2019. Results were reported on 122 of these patients; 36 had their NCCT images analyzed by Rapid ASPECTS and 86 had their NCCT images analyzed by a remote neuroradiologist who received the image by the text messaging platform WhatsApp. The applicant asserted that Rapid ASPECTS had excellent agreement (k=0.80) with the neuroradiologist's read. The door-to-needle time for the 86 WhatsApp-read patients was 52.3 ±16 minutes and for the 36 Rapid ASPECTS patients was 36.8 ±11 minutes (p=0.001), representing a 14-minute reduction in the door-to-treatment time in Rapid ASPECTS group compared with the WhatsApp standard care group. According to the applicant, there was also a significantly increased likelihood of functional independence and fewer hemorrhagic complications in patients treated with reperfusion therapy in the Rapid ASPECTS group (p<0.001). The applicant also asserted that the use of Rapid ASPECTS was shown to be cost-effective in this study.[558]

Response: We appreciate the applicant's responses to questions asked at the New Technology Town Hall Meeting. Regarding generalizability, we note that the study results from a small, non-randomized sample generated from a single hospital in Alexandria, Egypt, may limit the ability to assert findings are generalizable across the variety of health care settings in the United States. We question whether the fact that the radiologists in this study received the images via WhatsApp is generalizable to the standard of care in the United States. We also note the study did not attempt to control for other variables such as the mix of patients in each group or time of day or other changes

[558] Mansour, Ossama Yassin, et al. ''Deciding Thrombolysis in AIS Based on Automated versus on WhatsApp Interpreted ASPECTS, a Reliability and Cost-Effectiveness Analysis in Developing System of Care.'' *Frontiers in Neurology* 11 (2020): 333.

in hospital practices over time. Additionally, since only patients with confirmed acute ischemic stroke were included in the study results, no information was given about the imaging and interpretation of other patients imaged. We note that the retrospective study had two neuroradiologists interpret the NCCT images at a later time and compare their ASPECT score to the Rapid ASPECTS-generated score reading the same scans. The study reported that in only one patient, the Rapid ASPECTS software underestimated the extent of early ischemic changes by providing an automated ASPECTS >6, while the score was <6 by agreement read (which would indicate that tPA treatment was not appropriate). We note that the clinical outcome of that patient was not reported.

We appreciate the information provided by the applicant and will take these comments into consideration when deciding whether to approve new technology add-on payments for Rapid ASPECTS.

p. Steripath® Micro™ Blood Collection System

Magnolia Medical Technologies, Inc. submitted an application for new technology add-on payments for the Steripath® Micro™ Blood Collection System, which is also referred to as the Steripath® Micro™ Initial Specimen Diversion Device (ISDD®), for FY 2022. The applicant described the Steripath® Micro™ ISDD® (''Steripath Micro'') as a proprietary and patent-protected single-use, disposable device, which is indicated for use in the collection of blood cultures by nurses, phlebotomists, and technicians in emergency departments and inpatient units in acute care hospitals to reduce blood culture contamination and false positive diagnostic test results for sepsis. According to the applicant, Steripath® Micro™ ISDD®, along with the Steripath and Steripath® Gen2, are part of a product portfolio utilizing their Steripath® ISSD® technology.

The applicant explained that the Steripath® Micro™ ISDD® uses a syringe-driven (or blood culture bottle-driven) architecture that uses negative pressure to flip a proprietary internal bladder, which, in turn, creates gentle negative pressure to divert and sequester the initial 0.6 to 0.9 mL of blood, the portion known to most likely contain contaminants. According to the applicant, once diversion is complete, the user presses a side button to isolate the diverted blood. The applicant further explained that once the blood is isolated, a second independent blood flow pathway is opened to collect the blood specimen into the syringe (or blood culture bottle) for blood culture testing.

The applicant stated that the design and development of the Steripath® Micro™ ISDD® was inspired by patients who present with symptoms concerning for sepsis and who are hypotensive (low blood pressure) and hypovolemic (low blood volume), have difficult intravenous access (DIVA), or are small in stature with lower blood volume. According to the applicant, clinicians typically utilize a syringe technique to collect blood from this patient population to enable management of negative pressure (attempting to avoid vein collapse) while improving the opportunity to collect a sufficient volume of blood to culture, which the applicant stated is a critical determinant of blood culture sensitivity (that is, avoiding false negative results). The applicant claimed that this patient population is generally ineligible for existing ISDD® technologies due to risk of vein collapse. According to the applicant, the negative pressure created by Steripath® Micro™ ISDD®'s bladder-driven mechanism is designed to achieve initial specimen diversion while avoiding collapsing of the veins (losing venous access) of this patient population. The applicant stated that the Steripath® Micro™ ISDD® is available with a preassembled sterile integrated syringe for syringe-driven diversion and blood culture sample collection, and components of the system may be used for infusion following sample collection after disconnection of the ISDD®.

According to the applicant, blood culture is the gold standard diagnostic test for bloodstream infections, including septicemia. The applicant explained that blood cultures are drawn from patients displaying symptoms of a potential bloodstream infection with results guiding therapeutic decisions and influencing outcomes for patients for their duration in acute care. The applicant stated that the standard of care is to collect two separate blood cultures, each consisting of two blood culture bottles containing aerobic or anaerobic medium. The applicant further noted that the major automated microbial blood culture detection systems (BACTEC and BacT/ALERT) recommend 8–10 mL of blood in each of the aerobic and anaerobic bottles—up to 40 mL total distributed across all four bottles.

The applicant stated that despite the critical role blood culture plays in providing diagnoses, an estimated 20 percent to over 50 percent of all positive blood culture results for sepsis are suspected to be false positive due to blood culture contamination, as explained in greater detail below.[559] The applicant stated that blood culture contamination creates clinical confusion which leads to a risk of inappropriate antibiotic therapy,[560 561 562 563] extended length of stay of an average of 2.0 to 2.4 days,[564 565] *Clostridium difficile* (CDI) infection,[566 567] multidrug resistance organism (MDRO) infections, Acute Kidney Injury (AKI),[568] hospital-acquired infection (HAI) or hospital-acquired condition (HAC),[569] false-positive Central Line-Associated Blood Stream Infection (CLABSI) treatment, false positives reported to National Healthcare Safety Network (NHSN)/CMS (thus biasing the data), and additional lab and/or other diagnostic testing.[570]

[570] Ibid. Doern G, et al. A Comprehensive Update on the Problem of Blood Culture Contamination and a Discussion of Methods for Addressing the

The applicant explained that the detection of bacteremia is of particular concern for Medicare beneficiaries, given that the mean age for United States patients afflicted with sepsis in 2014 was 66.5, with sepsis present in 35 percent of all United States hospitalizations that resulted in death.[571]

With regard to the newness criterion, the Steripath® Micro™ ISDD® is a Class II medical device that received 510(k) clearance from the FDA on October 8, 2020. The 510(k) clearance was based on substantial equivalence to an earlier version of the device, Steripath® Gen2, which received 510(k) clearance on February 28, 2020. According to the applicant, the Steripath® ISDD® product portfolio, including the Steripath® Micro™ ISDD®, is the only FDA 510(k)-cleared family of devices indicated to reduce blood culture contamination.[572] According to the applicant, a supplemental Special 510(k) submission and clearance is anticipated for an additional configuration of the Steripath® Micro™ ISDD® device that incorporates a butterfly safety venipuncture needle.

According to the applicant, there are currently no ICD–10–PCS procedure codes to distinctly identify the use of the Steripath® Micro™ ISDD®. The applicant submitted a request for a new ICD–10–PCS procedure code for implementation on October 1, 2021.

As discussed above, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

According to the applicant, diversion techniques use the same basic principle to reduce blood culture contamination by sequestering blood most likely to contain dislodged skin fragments and/or flora. With regard to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, the applicant discussed current/alternative treatments to avoid blood contamination, but states that manual diversion, passive diversion, and the Steripath® Gen2 device are not comparable alternatives to Steripath® Micro™.

According to the applicant, manual diversion, which involves the phlebotomist or other medical professional first collecting blood into a waste tube and then manually switching to a sample collection tube, is not a replacement for Steripath® Micro™ ISDD® because manual diversion inherently entails additional opportunities for human error through touch contamination and process variation, without the ability to manage and ensure healthcare worker compliance. The applicant further explained that manual diversion techniques introduce, at a minimum, one additional surface (waste tube top), which must either be sterilized (or carefully handled if pre-packaged sterile) to avoid cross contamination through the inoculation needle. The applicant noted that if the inoculation needle is contaminated in this manner, both blood culture bottles can become contaminated, which can be interpreted (inaccurately) as a true positive through laboratory testing. The applicant explained that Steripath® Micro™ ISDD® is a closed system to prevent opportunities for touch contamination beyond conventional methods of blood culture sample acquisition. The applicant further explained that since Steripath® Micro™ ISDD® is a pre-assembled and packaged sterile kit that does not require manual connections, it avoids touch-point contamination and prevents the need for additional time, focus, and manual diversion procedural compliance from the operator.

The applicant stated that the Kurin product, a competitor diversion device that uses passive diversion (or relying on the patients blood pressure), is not a comparable alternative to Steripath® Micro™ ISDD® as it is not FDA-cleared to reduce blood-culture contamination. The applicant claimed that passive diversion, because of its limitations, is integrated into the Kurin product to redirect 0.15 mL of blood. The applicant stated that passive devices are susceptible to bypassing diversion when the culture bottle is inoculated before diversion is complete, and that this limitation is not present within the Steripath® Micro™ ISDD® architecture. The applicant asserted that the Steripath® Micro™ ISDD® uses a novel syringe-driven (or blood culture bottle-driven) negative pressure to flip an internal bladder which, in turn, creates gentle negative pressure to divert and sequester the initial 0.6 to 0.9 mL of blood.

The applicant further stated that the Steripath® Gen2 ISDD® is not a comparable product to Steripath® Micro™ ISDD®, as it uses greater negative pressure to divert an initial 1.5–2.0 mL of blood for the adult patient population. According to the applicant, the Steripath® Micro™ ISDD® platform leverages ISDD® technology but is smaller, easier-to-use, and employs a novel proprietary diversion bladder technology to address patients who are hypotensive and hypovolemic, have difficult intravenous access, or are small in stature with lower blood volume.

Specifically, the applicant explained that the Steripath® Micro™ ISDD® uses syringe-driven (or blood culture bottle-driven) negative pressure to flip an internal bladder which in turn creates gentle negative pressure to effectively and consistently divert and sequester the initial 0.6 to 0.9 mL of blood, the portion known to most likely contain contaminants, with this patient population. The applicant asserts this differentiates the Steripath® Micro™ from the Steripath® Gen2. The applicant further explained that once diversion is complete, the user presses a button to isolate the diverted blood and, automatically, a second independent blood flow pathway opens to collect the blood specimen into the syringe (or blood culture bottle) for culture.

With respect to the second criterion, whether the technology is assigned to the same or a different MS–DRG, the applicant did not indicate whether the Steripath® Micro™ ISDD® would be assigned to the same MS–DRGs as cases representing patients who receive diagnostic information from competing technologies or traditional blood collection methods.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant stated that the Steripath® Micro™ ISDD® was fundamentally designed to address a specific and broader patient population than any other technology that is currently available and FDA 510(k) cleared to prevent blood culture contamination. The applicant explained that in a certain subset of 'hard-stick' (low blood volume, hypovolemic and hypotensive) patients, blood culture using passive diversion or the Steripath® Gen2 ISDD® is not possible. According to the applicant, Steripath® Micro™ is the first ISDD designed specifically to address the unmet needs of the low blood volume, hypovolemic and hypotensive, 'hard-stick' patient populations (many requiring integrated sterile syringe collection) that is FDA 510(k) cleared indicated to reduce blood culture contamination.

We have the following concerns regarding whether the technology meets

Problem. *Clinical Microbiology Reviews.* 2020; 33:e00009–19.

[571] Rhee C, et al. Incidence and Trends of Sepsis in US Hospitals Using Clinical vs Claims Data, 2009–2014. *JAMA.* 2017; 318:1241–1249.

[572] Bell, Mary, et al. Effectiveness of a novel specimen collection system in reducing blood culture contamination rates. *Journal of Emergency Nursing* 44.6 (2018): 570–575.

the substantial similarity criteria and whether it should be considered new. Although we understand that the Steripath® Micro™ ISDD® version may divert less blood volume and utilize less negative pressure than the Steripath® Gen2 ISDD®, we note that both devices utilize negative pressure and, according to the applicant, leveraged Magnolia Medical Technologies' foundational ISDD® technology, and it is unclear whether this represents a new mechanism of action. We further note that the applicant also appears to consider the devices as similar, as they exclusively rely on studies conducted using the Steripath® Gen2 ISDD® to demonstrate substantial clinical improvement. We therefore believe that the newness date for Steripath® Micro™ ISDD® would begin on February 28, 2020, the date on which the predicate device received 510(k) clearance.

We also note that the applicant claimed that the Steripath® ISDD® product portfolio, including the Steripath® Micro™ ISDD®, is the only FDA 510(k)-cleared family of devices indicated to reduce blood culture contamination and we are inviting public comment on whether there are other FDA-cleared products designed to reduce blood culture contamination.

We are inviting public comments on whether the Steripath® Micro™ ISDD® is substantially similar to other technologies and whether the Steripath® Micro™ ISDD® meets the newness criterion.

With regard to the cost criterion, the applicant searched the FY 2019 MedPAR FR claims data file with the FY 2019 Final Rule IPPS Impact File to identify potential cases representing patients who may be eligible for treatment using Steripath® Micro™ ISDD®.

The applicant used 37 Infection ICD–10–CM Diagnosis Codes and 15 Sepsis ICD–10–CM Diagnosis codes to identify patients who could potentially benefit from the Steripath® Micro™ ISDD® during an inpatient stay. These ICD–10–CM codes are provided in the following table:

BILLING CODE 4120–01–P

	37 Infection ICD-10-CM Diagnosis Codes
Code	**Code Descriptor**
A04.0	Enteropathogenic Escherichia coli infection
A04.1	Enterotoxigenic Escherichia coli infection
A04.2	Enteroinvasive Escherichia coli infection
A04.3	Enterohemorrhagic Escherichia coli infection
A04.4	Other intestinal Escherichia coli infections
A24.9	Melioidosis, unspecified
A49.01	Methicillin susceptible Staphylococcus aureus infection, unspecified site
A49.02	Methicillin resistant Staphylococcus aureus infection, unspecified site
A49.9	Bacterial infection, unspecified
B95.2	Enterococcus as the cause of diseases classified elsewhere
B95.61	Methicillin susceptible Staphylococcus aureus infection as the cause of diseases classified elsewhere
B95.62	Methicillin resistant Staphylococcus aureus infection as the cause of diseases classified elsewhere
B95.7	Other staphylococcus as the cause of diseases classified elsewhere
B96.1	Klebsiella pneumoniae [K. pneumoniae] as the cause of diseases classified elsewhere
B96.20	Unspecified Escherichia coli [E. coli] as the cause of diseases classified elsewhere
B96.21	Shiga toxin-producing Escherichia coli [E. coli] (STEC) O157 as the cause of diseases classified elsewhere
B96.22	Other specified Shiga toxin-producing Escherichia coli [E. coli] (STEC) as the cause of diseases classified elsewhere
B96.29	Other Escherichia coli [E. coli] as the cause of diseases classified elsewhere
B96.5	Pseudomonas (aeruginosa) (mallei) (pseudomallei) as the cause of diseases classified elsewhere
J15.0	Pneumonia due to Klebsiella pneumoniae
J15.1	Pneumonia due to Pseudomonas
J15.20	Pneumonia due to staphylococcus, unspecified
J15.211	Pneumonia due to Methicillin susceptible Staphylococcus aureus
J15.212	Pneumonia due to Methicillin resistant Staphylococcus aureus
J15.5	Pneumonia due to Escherichia coli
J15.6	Pneumonia due to other Gram-negative bacteria
J95.851	Ventilator associated pneumonia
K55.30	Necrotizing enterocolitis, unspecified
K55.31	Stage 1 necrotizing enterocolitis
K55.32	Stage 2 necrotizing enterocolitis
K55.33	Stage 3 necrotizing enterocolitis
N39.0	Urinary tract infection, site not specified
R78.81	Bacteremia
T81.4XXA	Infection following a procedure, initial encounter
Z22.321	Carrier or suspected carrier of Methicillin susceptible Staphylococcus aureus
Z22.322	Carrier or suspected carrier of Methicillin resistant Staphylococcus aureus
Z86.14	Personal history of Methicillin resistant Staphylococcus aureus infection

	15 Sepsis ICD-10-CM Diagnosis codes
Code	Code Descriptor
A26.7	Erysipelothrix sepsis
A32.7	Listerial sepsis
A41.01	Sepsis due to Methicillin susceptible Staphylococcus aureus
A41.02	Sepsis due to Methicillin resistant Staphylococcus aureus
A41.1	Sepsis due to other specified staphylococcus
A41.2	Sepsis due to unspecified staphylococcus
A41.50	Gram-negative sepsis, unspecified
A41.51	Sepsis due to Escherichia coli [E. coli]
A41.52	Sepsis due to Pseudomonas
A41.59	Other Gram-negative sepsis
A41.81	Sepsis due to Enterococcus
A41.89	Other specified sepsis

	15 Sepsis ICD-10-CM Diagnosis codes
Code	Code Descriptor
A41.9	Sepsis, unspecified organism
R65.20	Severe sepsis without septic shock
R65.21	Severe sepsis with septic shock

BILLING CODE 4120–01–C

In its analysis, the applicant identified a primary cohort to assess whether this therapy met the cost criterion. The applicant stated that clinical literature suggests the DIVA population represents anywhere from 17 percent to 59 percent of all patients that present as symptomatic for sepsis and require blood cultures.[573] [574] [575] The applicant added that the literature did not provide any additional information on the distribution of the DIVA population within the larger infection/sepsis population. To account for this, the applicant randomly selected 33% of claims that included one of the ICD–10 codes listed above in one of the first two diagnosis code positions on the claim to include in the cost analysis.

The applicant removed MS–DRGs describing kidney and urinary tract infections and renal failure because these cases are not likely to benefit from use of the Steripath® Micro™ ISDD®. The applicant stated that these diagnoses rely on technologies not relevant to Steripath® Micro™ ISDD®, such as urine cultures and blood cultures specific to urea and creatinine. Lastly the applicant excluded cases in MS–DRGs that accounted for less than 1% of the total cases in the identified sample.

The claim search conducted by the applicant resulted in 295,790 claims mapping to six MS–DRGs: 871 (Septicemia or severe sepsis w/o mv >96 hours w mcc), 872 (Septicemia or severe sepsis w/o mv >96 hours w/o mcc), 853 (Infectious & parasitic diseases w o.r. procedure w mcc), 870 (Septicemia or severe sepsis w mv >96 hours or peripheral extracorporeal membrane oxygenation (ecmo)), 854 (Infectious & parasitic diseases w o.r. procedure w cc), and 177 (Respiratory infections & inflammations w mcc). The applicant determined an average unstandardized case weighted charge per case of $69,973.

The applicant stated that studies show blood culture contamination (BCC) increases length of stay (LOS) and leads to unnecessary antimicrobial therapy and/or hospital-acquired conditions. The applicant stated that a retrospective analysis involving hospitalized patients with septicemia-compatible symptoms found that avoiding BCC would decrease costs by $6,463, including $4,818 in savings for inpatient care. 53 percent of savings were attributed to reduced LOS and 26 percent to reduced antibiotic use.[576] The applicant stated that to account for these savings, they removed $2,500 by inflating costs to charges using the national average cost-to-charge ratio (CCR) for routine days and $2,300 by inflating costs to charges using the pharmacy national average CCR. Because the previous study cited did not describe where non-LOS related inpatient savings arose, the applicant assumed that the savings arose from reduced drug use and therefore the pharmacy national average CCR was used.

Because, according to the applicant, savings accrue in around 3% of cases where the Steripath® Micro™ ISDD® is used, the applicant applied three percent of the savings described above to every case in the sample population. The applicant stated that removing the $4,800 in cost savings from 3 percent of the cases is mathematically the same as removing 3 percent of the cost savings from all cases. The applicant then standardized the charges using the FY 2019 Final Rule Impact File. Next, the applicant applied the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges (1.13218). To calculate the charges for the technology, the applicant used the national average CCR for the Supplies and Equipment cost center of 0.297 from the FY 2021 Final IPPS rule. The applicant calculated a final inflated average case-

[573] Sou, V., et al. A clinical pathway for the management of difficult venous access. BMC Nursing 16, 64 (2017).

[574] Armenteros-Yeguas V., et al. Prevalence of difficult venous access and associated risk factors in highly complex hospitalized patients. J Clin Nurs. 2017;26(23–24):4267–4275.

[575] Van Loon, FH, et al. Development of the A–DIVA Scale: A Clinical Predictive Scale to Identify Difficult Intravenous Access in Adult Patients Based on Clinical Observations. Medicine. 2016 Apr;95(16)e3428.

[576] Geisler, BP, *et al.* Model to evaluate the impact of hospital-based interventions targeting false-positive blood cultures on economical and clinical outcomes. J Hosp Infect. 2019 Aug;102(4):438–444.

weighted standardized charge per case of $76,796, which exceeded the average case-weighted threshold amount of $69,973 by $6,824. The applicant stated that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the therapy meets the cost criterion.

Based on the information provided by the applicant, we note the following concerns with regard to the cost criterion. In its analysis, the applicant stated it randomly selected 33% of claims that included one of the ICD–10 codes listed above in one of the first two diagnosis code positions on the claim to include in the cost analysis. Implicit in this decision to randomly select a subsample is the belief that Steripath® Micro™ ISDD® cases are randomly distributed across all cases identified. If performed properly, the intent of random sampling from a population is to identify a smaller group of cases which remains representative or similar to the greater population. An added effect of proper random sampling is that the sample often has less variance than the population from which it was drawn. We are therefore concerned that random sampling may be inappropriate in this situation if the potential cases are not similarly randomly distributed.

Furthermore, if it is true that a subset of cases would be more representive of cases eligible for use of the Steripath® Micro ™ ISDD®, it may be more likely that those cases will be distributed based on certain characteristics, not randomly distributed. We are seeking public comment on whether the random sample used by the applicant would appropriately identify the cases eligible for the use of Steripath.

In its cost analysis, the applicant stated that, in order to account for savings from the use of Steripath® Micro™ ISDD®, it removed $2,500 by inflating costs to charges using the national average cost-to-charge ratio (CCR) for routine days and $2,300 by inflating costs to charges using the pharmacy national average CCR. From a methodological standpoint, we are not certain that the data from which savings were calculated are generalizable to the broader Medicare population's experience if Steripath® Micro™ Blood Collection System is used. Specifically, we are not certain that the patient population and the resulting conclusions from the aforementioned study [577] adequately generalize to the Medicare population.

Lastly, the applicant stated that because savings accrue in around three percent of cases where the Steripath® Micro™ ISDD® is used, the applicant applied three percent of the savings described previously to every case in its sample population. We are unclear whether the three percent of cases which experienced savings in the one study provided by the applicant is adequately representative of the Medicare population. We are not certain that three percent of a sample experiencing some level of savings is the same as all cases experiencing three percent savings. Therefore, we are not certain that it is appropriate to apply three percent of savings across all cases in the applicant's cost analysis. As with the reduction in charges discussed previously, while the applicant's approach provides a more conservative estimate for purposes of the cost criterion, we question whether it accurately reflects the experiences of providers and Medicare beneficiaries.

We invite public comment on whether Steripath® Micro™ ISDD® meets the cost criterion. With respect to the substantial clinical improvement criterion, the applicant asserted that the Steripath® Micro™ ISDD® represents a substantial clinical improvement over existing technologies. The applicant stated that data from studies show that Steripath Micro™ ISDD® offers the ability to reduce blood collection contamination with skin flora and asserted that it improves clinical outcomes relative to services or technologies previously available as demonstrated by reducing clinically significant adverse events (that is, a decrease in inappropriate antibiotic use and a decrease in inappropriate hospitalizations).

The applicant submitted with its application 17 Steripath® ISDD® technology-specific studies, including 5 peer-reviewed studies published in scientific journals, that it stated support the contamination rate reduction with Steripath® Gen2 ISDD ® of 73.6 percent to 100 percent, with resulting sustained contamination rates of 0.97 percent to 0.0 percent, which the applicant stated is below the 3.0 percent gold standard benchmark rate for blood culture contamination.[578]

The applicant submitted a retrospective controlled study by Bell M, et al.[579] that showed that investigators seeking to lower the blood culture contamination rate at four different Lee Health (a healthcare system in Florida) emergency departments found that Steripath® Gen2 ISDD® implementation reduced their blood culture contamination rate by 83.0 percent when compared to conventional methods of sample acquisition, (that is without diversion). The Lee Health emergency departments compared contamination rates obtained using Steripath® Gen2 ISDD® device as the standard of care from May 2016 through November 2016 to conventional methods which were collected from October 2015 through November 2016. The applicant stated that these findings support their claim that Steripath® ISDD® reduces the risk of blood culture contamination.

The applicant submitted the Bauman, K, poster,[580] where investigators seeking to lower the blood culture contamination rate at the Inova Fairfax Medical Center found that Steripath® Gen2 implementation reduced their blood culture contamination rate by 81.5% when compared to conventional methods of sample acquisition. The trial use of Steripath® Gen2 lasted for one year, and results were compared to conventional methods for the year preceding the trial. According to the applicant, findings support the claim that Steripath® reduces the risk of blood culture contamination, while historical patient data from this hospital supported the claim that the lower contamination rate Steripath® enables will translate into a reduced patient length of stay of one day per avoided false positive event.

The applicant submitted the Blakeney J, et al.[581] poster, a prospective controlled study comparing the use of Steripath® ISDD® to standard collection methods and the effect on blood culture contamination rates. Over a 16-week period, participants' blood was collected using both the Steripath® and conventional methods, with each being recorded. Per the applicant, outcomes showed that Steripath® ISDD® implementation reduced Beebe Healthcare's blood culture contamination rate by 74.6 percent when compared to conventional methods of sample acquisition. The applicant stated that the findings support the claim that Steripath® ISDD® reduces the risk of blood culture contamination.

[581] Blakeney J, et al. ''Reduction of Blood Culture Contamination Using Initial Specimen Diversion Device''Poster presented at: American Society for Microbiology Annual Meeting (2018).

The applicant submitted the Church K, et al.[582] prospective controlled study, which showed that investigators at the Medical University of South Carolina emergency department found that Steripath® Gen2 ISDD® implementation reduced their blood culture contamination rate by 73.6 percent when compared to conventional methods of sample acquisition. In this 20-month study, nurses were given autonomy to decide if a patient would be best served by the Steripath® Gen2 device or conventional methods, with choices being recorded. The uptake rate of the Steripath® Gen2 device was 66%, with exclusions being uncooperative patients and difficult to stick patients.

The applicant submitted the Gauld L, et al.[583] study, an eight month long prospective controlled study which showed that investigators seeking to lower the blood culture contamination rate at the Medical University of South Carolina emergency department found that Steripath® Gen2 ISDD® implementation reduced their blood culture contamination rate by 86.3 percent when compared to conventional methods of sample acquisition.

The applicant submitted a poster, Lanteri C, et al.,[584] with preliminary data and a paper, Huss, J, et al.,[585] that includes all of the poster data with additional data gathered. This prospective controlled study at Brooke Army Medical Center showed that Steripath® Gen2 ISDD® implementation reduced blood culture contamination rate by 91.7 percent from September 2015 through January 2016, and 89.7 percent from September 2015 through March 2016 when compared to conventional methods of sample acquisition.

The applicant submitted the Rupp M, et al.[586] paper, which is a 12-month, single center, prospective, controlled, open label trial. Investigators at the University of Nebraska Medical Center emergency department seeking to gauge the efficacy of the Steripath® Gen2 ISDD® without confounding variables conducted a matched-set controlled study and found that Steripath® implementation reduced their blood culture contamination rate by 87.6 percent when compared to conventional methods of sample acquisition.

The applicant submitted the Stonecypher K, et al.[587] 8 week pilot study, which showed that investigators at the Michael E. DeBakey VA Medical Center emergency department found that Steripath® Gen2 ISDD® implementation reduced their blood culture contamination rate by 83.1 percent when compared to conventional methods of sample acquisition.

The applicant submitted the Tompkins L, et al.[588] abstract, which showed that investigators seeking to lower the blood culture contamination rate at Stanford Health Care found that Steripath® Gen2 ISDD® implementation reduced their blood culture contamination rate by 100 percent over a 4-month period when compared to conventional methods of sample acquisition. According to the applicant, full results are anticipated but not presently published.

The applicant submitted the Tongma C, et al.[589] prospective controlled study, which showed that investigators seeking to lower the blood culture contamination rate at Rush University Medical Center emergency department found that Steripath® Gen2 ISDD® implementation reduced their blood culture contamination rate by 87.0 percent when compared to conventional methods of sample acquisition. The 6-month study was split into an initial 3 months of usual care and a subsequent 3 months using the Steripath® Gen2 ISDD®.

The applicant provided the following studies to support secondary claims of substantial clinical improvement:

The applicant submitted the Buchta C, et al.[590] animal (pig) model study, in which investigators hypothesized that despite proper skin antiseptic use, contamination may occur because flora from deeper regions (such as pores) are not effectively eliminated. The applicant stated that results confirmed the hypothesis that cannula may cause tissue fragments to be punched in the process of blood sample acquisition, supporting the mechanism by which Steripath® Gen2 ISDD® primarily addresses blood culture contamination (that is, diversion).

The applicant submitted the Rhee C, et al.[591] retrospective cohort study, which featured adult patients admitted to 409 academic, community, and Federal hospitals from 2009–2014. Investigators sought to estimate national sepsis incidence and trends, concluding that sepsis was present in 6 percent of adult hospitalizations and 35 percent of hospitalizations resulting in death. According to the applicant, this helps put into context the role of Steripath® ISDD® in improving the efficacy of the primary tool used to guide therapy for bloodstream infections: blood culture.

The applicant submitted the Zimmerman F, et al.[592] paper (a randomized clinical trial) and the Binkhamis K and Forward K[593] paper (a prospective controlled study), which demonstrated that manual diversion reduced blood culture contamination rate by 60.0 percent and 28.2 percent, respectively, when compared to conventional methods of sample acquisition.

The applicant also submitted the Patton R and Schmitt T[594] prospective controlled study, which showed that investigators seeking to trial manual diversion of 1 mL to lower the blood culture contamination rate at the Northwest Hospital and Medical Center Emergency Department found that manual diversion reduced their blood culture contamination rate by 43.8 percent when compared to conventional methods of sample acquisition. The applicant further stated that the findings additionally support the volume of diversion utilized by Steripath® Micro™ ISDD®.

[594] Patton R and Schmitt T. Innovation for reducing blood culture contamination: initial specimen diversion technique. *Journal of Clinical Microbiology* 48.12 (2010): 4501–4503.

The applicant also submitted the Syed S, et al.[595] preintervention and postintervention study, which showed that investigators at the AMITA Health Saint Francis Hospital Emergency Department found that manual diversion reduced their blood culture contamination rate by 30.9 percent when compared to conventional methods of sample acquisition.

According to the applicant, the findings from these four studies support the claim that manual diversion reduces the risk of blood culture contamination relative to conventional methods of sample acquisition. We note that these studies discussed manual diversion and not Steripath® Micro™ or other diversion devices.

The applicant submitted the Alahmadi Y, et al.[596] study, which is a retrospective case-control study that showed that false positive blood cultures were associated with an average 5.4 day increase in patient length of stay and average increases of more than $7,500 in total charges to a healthcare system. The applicant also submitted the Bates D, et al.,[597] which is a prospective controlled study that showed false positive blood cultures were associated with an average of a 4.5 day increase in patient length of stay and average increases of more than $4,000 in total charges to a healthcare system. According to the applicant, investigators also noted that contaminants were independently correlated with a 39 percent increase in antibiotic charges.

The applicant provided a study to support its claim that the Steripath® ISDD® reduces the average length of stay for patients requiring blood culture, thereby lowering their risk of hospital-acquired infections (HAI) and conditions (HAC). The applicant explained that the Skoglund E, et al.[598] decision tree health care economic model paper showed that investigators found that overall, each false positive blood culture was on average associated with 2 day increases in patient length of stay and an average increase of more than $4,500 in total charges to a healthcare system. According to the applicant, Steripath® ISDD® implementation may reduce costs associated with contamination and reduce the average patient length of stay.

The applicant provided four studies to support its claim that Steripath® ISDD® reduces the inappropriate administration of vancomycin and other antibiotics to drive antibiotic stewardship. The applicant submitted the Chang D, et al.[599] poster, a retrospective, nonrandomized study that recorded the San Antonio Military Medical Center Emergency Department's days of therapy (DOT) of vancomycin for 18 months as a baseline. Then, the hospital implemented a new blood culture test, and recorded the DOT of vancomycin for 7 months. Subsequently, the hospital implemented the Steripath® Gen2 device and recorded the DOT of vancomycin for an additional 14 months to complete the 39-month trial. Investigators found that Steripath® Gen2 ISDD® implementation reduced vancomycin days of therapy by 14.4 days per 1,000 patient days when compared to conventional methods of sample acquisition. According to the applicant, findings from the study, as reported by the study authors, support the claim that Steripath® ISDD® reduces the unnecessary administration of antibiotics by reducing the rate of false positive blood cultures.

The applicant also submitted the Souvenir D, et al.[600] cohort study of 3,276 cultures of blood from 1,433 patients in which investigators found that physicians treated almost half of all patients receiving a false positive blood culture result with antibiotics, with vancomycin misuse occurring in 34 percent of patients. The applicant also submitted the Heijden Y, et al.[601] study in which investigators found that physicians treated 27% of patients receiving a false positive blood culture result with antibiotics unnecessarily, with the median antibiotic regimen being 7 days in length. The applicant also submitted the Bates study,[602] as discussed previously, which showed contaminants were independently correlated with a 39 percent increase in antibiotic charges.

According to the applicant, as Steripath® ISDD® is designed to reduce the incidence of blood culture contamination, Steripath® ISDD® implementation may reduce unnecessary antibiotic administration while supporting antimicrobial stewardship.

We have the following concerns regarding the substantial clinical improvement criterion. We note that much of the evidence submitted by the applicant to support that Steripath® Micro™ represents a substantial clinical improvement over existing technologies speaks to the overall clinical value of reducing blood contamination, or the benefit of manual diversion over no diversion, but does not directly link the Steripath® Micro™ to improved clinical endpoints. We note that the applicant stated that all of the studies provided that address the specific technology used to reduce blood contamination through diversion of the initial sample during blood collection utilized the Steripath® Gen2 ISDD®, not the Steripath® Micro™ ISDD® and we therefore question whether we have sufficient information to assess the clinical impact of Steripath® Micro™. Furthermore, the applicant did not present any clinical data to compare Steripath® Micro™ ISDD® to the Steripath® Gen2 ISDD®. We also note that comparative studies between Steripath® Micro™ and either manual diversion or competitor devices were not provided, and we question whether the standard of care used in the studies (that is, no diversion) is an appropriate comparator against which to test this technology. Additionally, we note that the applicant did not provide any clinical data demonstrating that the Steripath® Micro™ directly reduced length of stay, *C. difficile* infections, or other secondary results of antibiotic overuse. We are interested in any clinical data that directly links the Steripath® Micro™ to these outcomes.

Finally, we note that the claim of gentle negative pressure in support of the applicant's assertion that the technology would provide a treatment option for a new patient population was not addressed by any of the studies submitted. In addition, no data was supplied that quantified appropriate levels of negative pressure for either the

typical or DIVA populations. Furthermore, no data was provided which compared the asserted appropriate level of negative pressure to levels of negative pressure created by the Steripath® Micro™ and Steripath® Gen2 devices. We are interested in any evidence of clinical improvement using the Steripath® Micro™ ISDD® in the specific population identified by the applicant, the difficult intravenous access population.

We are inviting public comments on whether the Steripath® Micro™ ISDD® meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for Steripath® Micro™ ISDD®.

q. StrataGraft™ Skin Tissue

Stratatech Corporation, a Mallinckrodt company, submitted an application for new technology add-on payments for the StrataGraft™ skin tissue (''StrataGraft'') for topical application for FY 2022. The applicant describes StrataGraft™ skin tissue as a viable, bioengineered, regenerative skin construct (BRSC) consisting of an epidermal layer of viable, fully stratified, allogeneic human NIKS® [603] keratinocytes growing on a dermal layer composed of viable human dermal fibroblasts embedded in a collagen-rich matrix. The applicant noted that StrataGraft™ is intended for the treatment of adult patients with severe thermal burns that contain intact dermal elements and require surgical intervention (hereinafter referred to as severe thermal burns [STB]). The applicant stated that StrataGraft™ skin tissue is produced in a rectangular format of approximately 100 cm^2, approximately 8 cm by 12.5 cm.

The applicant explained that the StrataGraft™ skin tissue promotes durable wound closure and regenerative healing for adult patients with STB. The applicant stated that in addition to providing immediate wound coverage and epidermal barrier function, the viable and metabolically active keratinocytes and fibroblasts in StrataGraft™ skin tissue provide sustained expression and secretion of growth factors, cytokines, and wound healing factors, which are anticipated to promote regenerative healing. The applicant stated that the StrataGraft™ skin tissue does not engraft; rather, it promotes regenerative healing and is replaced by the patient's own cells, eliminating the need for autografting to attain definitive closure of treated wounds.

The applicant explained that a thermal burn is the most common type of burn injury and accounts for approximately 86 percent of burn cases.[604] The applicant noted that burns are classified according to the depth of tissue injury as superficial (first-degree burns), partial-thickness (superficial and deep partial-thickness; second-degree burns), full-thickness (FT, third-degree burns), and fourth-degree burns (burns that have injured deeper structures such as muscle, fascia, and bone).[605] [606] The applicant also noted the percentage of total body surface area (TBSA) determines burn severity and directly correlates with mortality.[607]

The applicant stated that in the U.S., approximately 500,000 burn injuries receive emergency medical treatment each year, leading to 40,000 burn injury hospitalizations with 30,000 at hospital burn centers.[608] [609] The applicant noted that children and the elderly represent especially vulnerable populations at increased risk for death due to the skin loss and its complications.[610] The applicant explained that in 2013, the rate of burn-related hospital stays was highest for infants aged younger than 1 year (29.6 per 100,000 population) and older adults (20.7 per 100,000 population for adults aged 65–84 and 26.3 per 100,000 population for adults aged 85 and older).[611] The applicant also stated that unintentional fire or burn injuries was the 8th leading cause of death in those 65 years or older.[612]

The applicant explained that today, 96.7 percent of burn patients treated in burn centers will survive. The applicant noted that many of those survivors will sustain serious scarring and life-long physical disabilities.[613] The applicant stated that burn injuries pose a significant burden to patients; they can have a considerably negative effect on the patient's health-related quality of life (HRQoL), which was estimated to be reduced by 30 percent at the time of injury and by 9 percent in the long term.[614] The applicant explained that although most functional domains affected by burn injuries recover over time, HRQoL scores pertaining to physical and emotional role participation, anxiety, depression, pain, work, and heat sensitivity remained low at 12 months after the injury.[615]

The applicant explained that the standard of care for STB injuries is early excision and skin grafting.[616] [617] [618] The applicant noted that common surgical interventions for burn injury include: escharotomy, debridement, excision, and skin grafting.[619] The applicant explained that these burns have been treated with autografts, allografts, and xenografts in the past. The applicant stated that autologous grafts (autografts) are used most frequently because of the

problems of infection and rejection when using allografts or xenografts.[620]

The applicant explained that autografting involves surgical harvesting of healthy tissue from the patient (donor site) and transplantation of this skin to an injured site on the same patient.[621] The applicant noted that autografts can be harvested as split thickness or full thickness. According to the applicant, split-thickness skin grafts (STSGs), also called partial-thickness grafts, transfer a portion of the donor site skin, including the epidermis and some of the underlying dermis. The applicant also explained that this allows the donor site to heal from the epidermal elements left behind. The applicant also stated that full-thickness skin grafts (FTSGs) harvest the entire layer of skin as the graft; no dermal or epidermal elements remain at the donor site, which must be closed by local advancement of the adjoining skin or by a secondary local flap. The applicant stated that the process of revascularization takes longer for an FTSG than for an STSG because of the increased thickness of the tissue.[622]

The applicant explained that early excision and skin grafting reduce the chance of wound infections and systemic sepsis, and have become the standard of care.[623] [624] [625] The applicant noted that without autografting, an STB that contains some dermal elements usually requires greater than 3 weeks to heal, thereby increasing the risk for infection and other complications that may lead to the development of significant scarring and contracture.[626] [627] [628] The applicant stated that while STBs require surgical debridement and grafting, superficial first-degree burns do not;[629] however, in the acute phase of the burn injury, the clinical presentation of the severely injured burn patient usually involves a range of burn depths from a superficial burn to a FT burn.[630]

The applicant explained that although autografting is effective in closing wounds and has been a standard treatment for decades, it has limitations. The applicant stated that donor sites are often associated with several complications, including excessive pain, pruritus, infection, dyschromia, hypertrophic scarring, delayed healing, and the potential for conversion to a FT wound.[631] The applicant also noted that donor-site pain is typically more painful than that in the treatment (burned) site and may become chronic.[632] [633] In patients with burns of 50–60 percent TBSA, autograft is limited by donor-site availability.[634] The applicant explained that donor sites may be re-harvested if they heal in time without infection; however, this practice can lead to prolonged hospitalization and decreased quality of the skin from re-harvested sites. The applicant stated that after patients undergo skin grafting, in the long term, both the grafted wound site and the donor site require continuous physical and rehabilitative therapy to maintain the range of movement, minimize scar and contracture development, and maximize functional ability.[635]

The applicant noted that autografting is especially undesirable in vulnerable patient populations, such as the elderly. The applicant stated that the healing of donor sites may be delayed or even lacking in elderly patients or patients whose wound-healing capabilities are compromised.[636] The applicant explained that because patients in these populations have thinner dermis and epidermis than non-elderly adults,[637] [638] there is a higher likelihood that the donor sites will go deep into the dermis during harvest or transform into FT wounds with their anatomical characteristics. The applicant stated that these patients are disproportionately affected and are at increased risk for death due to the skin loss and its complications.[639] The applicant also noted that the American College of Surgeons (ACS) developed guidelines to educate surgeons and other medical professionals about the significance of older adult burns and evidence-based prevention activities.[640]

The applicant stated that burn injuries result in substantial economic burden for healthcare systems and society. The applicant noted the average total hospital charges for a surviving patient with burns was estimated to be $98,062 and a patient who did not survive burns was estimated at $309,546.[641] For patients undergoing inpatient autografting, the applicant asserted that significant healthcare costs were observed during the first year, including per patient mean all-cause healthcare costs which ranged from $155,272 to $184,805.[642] The applicant explained that the primary cost driver in the first year was the cost incurred from the initial inpatient episode with autografting, accounting for 85 percent of the total costs.[643]

The applicant stated that there is currently no skin replacement product approved or available that leads to durable wound closure while

[643] Ibid.

eliminating the need for harvesting an autograft.[644] [645]

The applicant explained that skin substitutes are a heterogeneous group of biologic, synthetic, or biosynthetic materials that can provide temporary or permanent coverage of open skin wounds. The applicant stated that the aim of skin substitutes is to replicate the properties of the normal skin,[646] and to provide the protective barrier function until definitive closure of the skin.[647] The applicant noted that synthetic skin substitutes need to be removed or undergo biodegradation or resorption so the skin can heal and regenerate.[648] The applicant also stated that biological skin substitutes have an architecture that resembles native skin and may allow the construction of a more natural new dermis.[649]

The applicant explained that skin substitutes are an important adjunct in the management of acute or chronic wounds and can be used to cover defects following burns or other injuries, or for reconstruction, such as for release of extensive severe post-burn contractures.[650] [651] The applicant also stated that Kumar's 3-category system, as shown in the table that follows, is currently the most frequently used classification system in the field. However, the applicant notes that there is no universally accepted classification system that allows for simple categorization of all the products that are commercially available.[652] The applicant stated that several biologic and biosynthetic materials are currently used as skin substitutes to temporarily cover wounds. The applicant provided the following table which, according to the applicant, classifies skin substitutes according to Kumar (2008) and summarizes the applicant's assertions regarding existing skin substitute products.

Skin substitute classification according to Kumar (2008)[653]

Class	Description	Sub-Category	Subdivision	Product Example
I	Temporary, impervious dressing material with mecahnical traits of the epidermis; lack keratinocytes	Single Layered Materials	Naturally occurring membrane or cover as biological dressing substitute	Biomembrane® Biocompatible vegetal membranes derived from the Hevea brasiliensis rubber tree
			Single-layer synthetic skin dressing material substitute	Tegaderm™, Opsite™, Dermafilm™, Nexfill®
		Bi-layered tissue-engineered materials		TransCyte®
II	Single-layer skin substitutes (epidermal or dermal)	Epidermal substitutes - similar to human epidermis; prone to breakdown; poor healing outcomes		Epice®, EpiDex®, Laserskin®, MySkin™, BioSeed®, CellSpray™
		Dermal substitutes - composition that includes proteins found in the dermal matrix		Permacol®, Matriderm®, Alloderm®
III	Composite skin substitutes that replace both the dermal and epidermal layer	Skin graft (autografts, allografts, and xenografts)		Allograft from cadaver, xenograft from porcine origin
		Tissue-engineered skin		Apligraf® (cellular), Integra® (acellular), Biobrane®

The applicant stated that StrataGraft™ skin tissue is a novel BRSC which possesses many of the physical and biological properties of an ideal skin substitute, including both epidermis and dermis with a barrier function comparable to that of intact human skin.[654] The applicant asserted that upon FDA approval, StrataGraft™ skin tissue will be the only skin substitute for treatment of STB classified by the FDA as a biologic (as

opposed to other available treatments that are medical devices) that promotes durable wound closure and regenerative healing, thereby reducing or eliminating the need of autologous skin harvesting. According to the applicant, on June 5, 2020, Mallinckrodt finalized the rolling submission of a Biologics License Application (BLA) to the FDA seeking approval to market StrataGraft™ skin tissue for the treatment of adult patients with STB. Currently, there are no ICD–10–PCS procedure codes to uniquely identify procedures involving Stratagraft™. We note that the applicant submitted a request for approval for a unique ICD–10–PCS code for the use of Stratagraft™ beginning FY 2022.

The applicant explained that StrataGraft™ skin tissue is a viable BRSC that may be applied universally to patients, that is, it is not a patient-specific product. The applicant stated that the active cellular components of StrataGraft™ skin tissue are the viable and metabolically active allogeneic human NIKS® keratinocytes and normal human dermal fibroblasts (NHDF).

The applicant noted that StrataGraft™ skin tissue comprises an epidermal layer and a dermal layer. The applicant explained that the epidermal layer of StrataGraft™ skin tissue is composed of differentiated, multilayered, viable epidermal keratinocytes that are adherent through normal hemidesmosomes to a dermal equivalent.[655] The applicant stated that human epidermal keratinocytes used are NIKS® keratinocytes, a continuous and consistent source of well-characterized, non-tumorigenic, long-lived keratinocyte precursors that are derived from a single neonatal human foreskin donor. The applicant asserted that NIKS® keratinocytes have normal steady state of messenger ribonucleic acid (mRNA) and protein expression levels for autocrine regulators and growth factors such as transforming growth factor (TGF)-α, TGF-β1, epidermal growth factor, and c-myc, providing further evidence of the normal function of these cells.[656] The applicant also explained that NIKS® keratinocytes produce normal adhesion proteins (example, integrins and cadherins) that permit tight adherence to each other and the dermal equivalent.[657] The applicant stated that cell-cell and cell-substratum adhesions confer excellent handling characteristics to StrataGraft™ skin tissue, enabling it to be meshed and secured in place as is routinely done with STSGs. The applicant noted that the dermal layer of StrataGraft™ skin tissue contains NHDF derived from a single healthy tissue donor.

The applicant explained that viable cells within StrataGraft™ skin tissue express and secrete a wide variety of peptides, growth factors, and cytokines that are known to promote healing, thereby reducing or eliminating the need for autograft in the management of thermal burns.[658] The applicant also stated that no currently available technology (competitor) for the treatment of STB is characterized by the autologous (endogenous) tissue regeneration of the burned skin.

The applicant stated that the StrataGraft™ skin tissue is manufactured through organotypic culture under aseptic conditions in compliance with current Good Manufacturing Practices. The applicant explained that in organotypic culture, NIKS® keratinocytes undergo tissue-appropriate differentiation and stratification to produce a skin tissue that exhibits many of the structural and biological properties of intact human skin. The applicant noted that the epidermal layer of StrataGraft™ skin tissue exhibits typical production and organization of cell-type specific proteins (example, keratin, filaggrin, involucrin, and transglutaminase), development of a normal cornified envelope, and production of lipid-filled granules that are necessary for the generation and maintenance of robust epidermal barrier function similar to that found in vivo.[659]

As discussed previously, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, according to the applicant, the mechanism of action of StrataGraft™ skin tissue in severe thermal burns is not the same or similar to an existing technology. The applicant states that StrataGraft™ skin tissue will be the first and only FDA-approved biologic for the treatment of STB that reduces or eliminates the need of autograft and for which the mechanism of action is a sustained expression and secretion of growth factors, cytokines, and wound healing factors, which are anticipated to promote regenerative healing and durable wound closure.[660] [661] The applicant explains that this unique mechanism of action is the reason StrataGraft™ skin tissue reduces or eliminates the need for harvest of donor site tissue.

With respect to the second criterion, whether a product would be assigned to the same MS–DRGs as existing technologies, the applicant indicated that the StrataGraft™ skin tissue would be assigned to the same MS–DRGs as cases representing patients who receive standard of care (autograft) or existing technologies used to treat STB. The applicant stated that the MS–DRGs in question do not differentiate between patients with burns of differential severity degree, in different body sites, due to thermal injury or corrosion, or with different percent TBSA involved.[662]

With respect to the third criterion, whether a product would be used to treat the same or similar type of disease and patient population, the applicant asserted that StrataGraft™ will treat the same or similar type of disease but not the same or similar patient population when compared to existing technologies. The applicant claimed that StrataGraft™ skin tissue will treat a burn patient population for whom the current standard of care and/or other available technologies may not be clinically feasible solutions to achieve durable wound closure. The applicant explains that in patients with burns of 50–60 percent of the TBSA, donor-site availability is limited.[663] The applicant also stated that autografting is especially

[663] Girard D, Laverdet B, Buhé V, et al. Biotechnological Management of Skin Burn Injuries: Challenges and Perspectives in Wound Healing and Sensory Recovery. Tissue Eng Part B Rev. 2017;23(1):59–82.

undesirable in vulnerable patient populations, such as the elderly; healing of donor sites may be delayed or even lacking in elderly patients or patients whose wound-healing capabilities are compromised.[664] The applicant explained that these patients are disproportionately affected and are at increased risk for death due to the skin loss and its complications.[665] The applicant also states that the label for StrataGraft™ skin tissue will not be reserved for a patient population diagnosed with STB for whom standard-of-care treatment is not feasible or clinically desirable. The applicant asserts that this does not imply that StrataGraft™ skin tissue will not offer a treatment option to a new patient population.

With respect to the first criterion, we note that there may be other biologic dressings that use some combination of keratinocytes, collagen, glycosaminoglycans (GAGs), cytokines, chemokines, and/or other growth factors in either a single, double, or triple layer configuration. While StrataGraft™ may have a unique combination of these features, we are interested in further information on whether there are any dressings with a regenerative mechanism of action that may be approved for burns.

With respect to the third criterion, StrataGraft™ may treat the same or similar patient population as the standard of care or existing technologies to treat STB. While we agree that in patients with burns of 50–60 percent of the TBSA, donor-site availability is more limited, we observe that neither of the two pivotal studies included patients with burns of 50 percent or greater of the TBSA.[666] We are unclear whether this suggests Stratagraft™ is intended for treatment of patients with burns of less than 50 percent TBSA. We also question whether vulnerable patients, such as the elderly, are a new population as they are currently treated using standard of care or other technologies.

We are inviting public comments on whether Stratagraft™ is substantially similar to other technologies and whether Stratagraft™ meets the newness criterion.

With regard to the cost criterion, the applicant stated that Stratagraft™ skin tissue is seeking FDA approval for the proposed indication of treatment of adult patients with STBs that contain intact dermal elements and require surgical intervention. In order to identify the range of MS–DRGs that eligible patients may map to, the applicant conducted a claims search for cases that include ICD–10–CM codes for thermal burns of second, third degree, or those classified according to TSBA to identify cases eligible for use of Stratagraft™ skin tissue utilization. The applicant identified cases reporting ICD–10–CM codes for diagnoses of second-degree thermal burns, any location (T20.2XXX to T25.2XXX); third-degree thermal burns, any location (T20.3XXX to T25.3XXX); and thermal burns classified according to extent of body surface involved (T31.XX).

The applicant used the FY 2019 MedPAR Hospital LDS with the FY 2022 thresholds, and the FY 2019 IPPS/LTCH Final Rule Impact File and Standardizing File. The appliant's claim search in the aggregate identified 58,624 cases mapping to 21 MS–DRGs as listed in the following table. Of the total 21 MS–DRGs, only six had case volume greater than or equal to one percent across all cohorts and cumulatively represent 97.54 percent of cases. In cases where MS–DRGs had fewer than 11 discharges, the applicant imputed a minimum value of 11 cases for each MS–DRG.

To demonstrate that the technology meets the cost criterion, the applicant first identified four separate patient cohorts: Cohort (1) Patients with thermal burns of second or third degree in any body area, or thermal burns classified according to TBSA, who received autograft for reasons only related to thermal burns (n=14,774, MS–DRGs=21); Cohort (2) Patients with thermal burns of second or third degree in any body area, or thermal burns classified according to TBSA, who received autograft for reasons only related to thermal burns, and who underwent excisional debridement in the inpatient setting (n= 13,640, MS–DRGs=20); Cohort (3) Patients with thermal burns of second or third degree in any body area, or thermal burns classified according to TBSA, who received autograft for thermal burns, with or without other conditions (n=15,744, MS–DRGs=21); and Cohort (4) Patients with thermal burns of second or third degree in any body area, or thermal burns classified according to TBSA, who received autograft for thermal burns, with or without other conditions, and who underwent excisional debridement in the inpatient setting (n= 14,466, MS–DRGs=20). The applicant then identified eight analyses for the cost criterion: (1) Calculations for Cohort one (all MS–DRGs); (2) Calculations for cohort two (all MS–DRGs); (3) Calculations for Cohort three (all MS–DRGs); (4) Calculations for cohort four (all MS–DRGs); (5) Calculations for Cohort one (top 4 MS–DRGs by case volume); (6) Calculations for Cohort two (top 4 MS–DRGs by case volume); (7) Calculations for Cohort three (top 4 MS–DRGs by case volume); and (8) Calculations for Cohort 4 (top 4 MS–DRGs by case volume).

The applicant determined an average unstandardized case weighted charge per case of $173,650 for analysis one, $168,282 for analysis two, $178,530 for analysis three, $172,277 for analysis four, $158,851 for analysis five, $155,700 for analysis six, $162,377 for analysis seven, and $158,452 for analysis eight.

The applicant stated that charges for and related to the prior technologies were not removed from the cost analysis.

After calculating the average standardized charge per case for all scenarios, the applicant calculated the standardized charge per case for each MS–DRG. Next, the applicant applied the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges of 13.2 percent (1.13218). The applicant stated that the price for Stratagraft™ skin tissue has not yet been established and therefore it did not add charges for the technology. Lastly, the applicant calculated the final average inflated standardized charge per case and the inflated case weighted standardized charge per case for each scenario.

The applicant stated that, for analysis one, the final inflated average case-weighted standardized charge per case of $304,347 exceeded the average case-weighted threshold amount of $173,650 by $130,697. For analysis two, the final inflated average case-weighted standardized charge per case of $279,373 exceeded the average case-weighted threshold amount of $168,282 by $111,091. For analysis three, the final inflated average case-weighted standardized charge per case of $332,006 exceeded the average case-weighted threshold amount of $178,530 by $153,477. For analysis four, the final inflated average case-weighted standardized charge per case of $299,228 exceeded the average case-weighted threshold amount of $172,277 by $126,951. For analysis five, the final inflated average case-weighted standardized charge per case of $241,186 exceeded the average case-weighted threshold amount of $158,851 by $82,336. For analysis six, the final inflated average case-weighted standardized charge per case of $229,661 exceeded the average case-weighted threshold amount of $155,700 by $73,961. For analysis seven, the final inflated average case-weighted standardized charge per case of $257,800 exceeded the average case-weighted threshold amount of $162,377 by $95,423. For analysis eight, the final inflated average case-weighted standardized charge per case of $244,042 exceeded the average case-weighted threshold amount of $158,452 by $85,590.

The applicant stated that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, Stratagraft™ meets the cost criterion.

We invite public comment on whether Stratagraft™ meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that StrataGraft™ skin tissue is a substantial clinical improvement over existing technology for the treatment of adult patients with severe thermal burns with intact dermal elements because it achieves a significant rate of durable wound closure for patients with severe burns while minimizing or eliminating the complications associated with autograft harvest.

According to the applicant, the totality of the circumstances otherwise demonstrates that StrataGraft™ skin tissue, relative to technologies previously available, substantially improves the treatment of STB patients including Medicare beneficiaries. The applicant stated that because the benefits associated with its use are not accompanied by an increased incidence of adverse events as compared to autograft, StrataGraft™ skin tissue is a substantial clinical improvement.

The applicant explained that by significantly reducing or eliminating the harvest of donor sites, patients who receive StrataGraft™ skin tissue are spared short- and long-term sequelae and complications and, to a lesser extent, infection or conversion to a full-thickness wound of the donor sites.[667] The applicant stated that by significantly reducing or eliminating the need for autograft,[668] StrataGraft™ skin tissue is especially relevant for the elderly population where autograft is undesirable; these patients are disproportionately affected and are at increased risk for death due to the skin loss and its complications.[669] The applicant explained that aging and environmental factors can influence the severity of burns in vulnerable skin.[670] [671] The applicant stated that geriatric skin also exhibits slower wound healing and is at increased risk of excessive scarring.[672] [673] [674] [675] [676] According to the applicant, age-related changes in wound healing capacity can include delayed infiltration of immune cells, decreased secretion of growth factors, and altered collagen remodeling.[677]

The applicant further explained that use of StrataGraft™ skin tissue can preserve limited donor sites for the treatment of other wounds, such as areas of FT injury and wounds in cosmetically sensitive areas. The applicant noted that it may also reduce the need for repeated harvest of autograft donor sites, potentially reducing the number of surgical procedures and total length of time to wound closure. The applicant explained that burn injury is associated with a high prevalence of posttraumatic stress disorder, ranging between 11 percent and 50 percent across studies,[678] and may also lead to anxiety and depression due to scarring and body image concerns.[679] Lastly, the applicant stated that use of StrataGraft™ skin tissue reduces pain while offering a comparable scar quality to autograft.[680]

The applicant provided two controlled and randomized studies, STRATA2011 and STRATA2016, to support its claims of substantial clinical improvement. The applicant stated that with the exception of subject age (STRATA2011, 18 to 64 years of age; STRATA2016, ≥18 years of age), the inclusion and exclusion criteria for the two studies were similar. According to the applicant, the STRATA2016 study (NCT03005106—Phase 3 trial—71 patients) [681] [682] was a 12-month, open-

Continued

label, multicenter, controlled, randomized study that evaluated the efficacy and safety of StrataGraft™ skin tissue in promoting autologous skin tissue regeneration of severe thermal burns. The applicant explained that the STRATA2011 study (NCT01437852—Phase 1b trial—30 patients)[683] [684] was a 12-month, open-label, multicenter, controlled, randomized, dose-escalation study that evaluated the safety, tolerability, and efficacy of StrataGraft™ skin tissue in promoting the healing of the STB component of complex skin defects due to thermal injury as an alternative to autografting. The applicant noted that, in both studies, eligible subjects had 3 percent to 49 percent TBSA burns with two comparable treatment sites that were prospectively identified, and the sites were randomized to receive either a single topical application of StrataGraft™ skin tissue or autograft, such that each subject received both treatments. The applicant noted that in this intrapatient comparator design, the area that was autografted served as a subject's own paired control.

To support the claim that the use of StrataGraft™ skin tissue significantly reduces the percent area of the treatment sites autografted, the applicant explained that the STRATA2016 study showed the average percent area of the StrataGraft™ skin tissue treatment site autografted by Month 3 was lower than the average percent area of the autograft control treatment site autografted by Month 3 (mean difference: 97.77 percent; $P < 0.0001$).[685] We note that the applicant did not provide detailed information regarding the measurement methodology.

To support the claim that StrataGraft™ skin tissue is effective in achieving durable wound closure similar to that of autografting, the applicant states that the STRATA2016 study showed that the majority of subjects (59 of 71 subjects, or 83.1 percent, with a 95 percent CI of 74.4 to 91.8) achieved durable wound closure of the StrataGraft™ skin tissue-treated site at Month 3 without the need for autograft harvest and placement.[686] The applicant also explained that the STRATA2011 study showed that no StrataGraft™ treatment sites required autografting by Day 28. The applicant noted that at Month 3 in the STRATA2016 study, 93.1 percent of StrataGraft™ treatment sites were assessed as closed. The applicant stated that all StrataGraft™ skin tissue-treated areas evaluated at 6 months and 12 months remained closed. The applicant noted that, when comparing these results to that of autografting, the proportion of wounds that achieved closure was not statistically different.[687]

To support the claim of reduction in donor site pain using StrataGraft, the applicant stated that the STRATA2016 study showed that the difference between the donor sites preserved for StrataGraft™ skin tissue treatment site failure and autograft donor sites in the average pain intensity through Day 14 based on the Wong-Baker FACES® Pain Rating Scale (FPRS)[688] was 2.40 ± 1.313 ($P < 0.0001$), indicating significantly less mean donor-site pain intensity in the reserved StrataGraft™ skin tissue donor sites compared with autograft donor sites.[689] The applicant also stated that the STRATA2011 study showed that patients experienced pain at harvested donor sites used for autograft, but minimal pain at unharvested donor sites that had been set aside for potential use with StrataGraft™ skin tissue.[690]

According to the applicant, the elimination of autografting leads to superior scar quality outcome of the presumptive StrataGraft™ skin tissue donor site (that is lack of scarring in the donor sites reserved for StrataGraft™ treatment site failure), which is a substantial clinical improvement. The applicant explained that the STRATA2016 study showed that the evaluation of scarring using the Patient and Observer Scar Assessment Scale (POSAS)[691] [692] observer total scores demonstrated a significant difference in scar quality between the StrataGraft™ skin tissue and autograft donor sites at Month 3, 10.0 ± 7.92 ($P < 0.0001$), favoring StrataGraft™ skin tissue.[693] The applicant stated that the STRATA2016 study showed scores for every POSAS category were lower for StrataGraft™ skin tissue donor sites when compared with autograft donor sites, indicating they were more like normal skin (that is, the patient's tissue in the donor sites reserved for StrataGraft™ failure were more like normal skin than tissue present in autograft donor sites that were harvested).[694] The applicant explained that the STRATA2011 study showed that observer POSAS total scores from the StrataGraft™ tissue treatment site and autograft were not significantly different throughout the study.[695] The applicant stated that the STRATA2011 showed that mean overall POSAS opinion scores of observers or patients decreased (that is, became more favorable) from Month 3 through Month 12 after application for both the StrataGraft™ tissue and autograft.[696]According to the applicant, although direct comparisons between StrataGraft™ skin tissue and other skin substitutes cannot be drawn, StrataGraft™ skin tissue, relative to device technologies previously available, improves the clinical outcomes of STB patients. The applicant stated that most skin substitutes do not claim to promote wound closure without the need for subsequent autograft because they have not been

[696] Ibid.

studied in this context,[697] while clinical studies for StrataGraft™ skin tissue assessed wound closure as a pre-specified endpoint.[698] [699] The applicant further stated that reparative healing mechanisms, used by most available skin substitutes, are more likely to result in scarring when compared with regenerative healing mechanisms used by StrataGraft.[700]

After reviewing the information provided by the applicant with regard to the substantial clinical improvement criterion, we note a lack of study data provided comparing StrataGraft™ to other biologic dressings and we are interested in further information related to whether there are any dressings that may be approved for burns that demonstrate durable wound closure. The applicant provided published results of one randomized trial (STRATA2011), but we question whether the sample size of 30 is adequately generalizable to the larger Medicare population. In addition, we note that the STRATA2016 study has not been published and the results of this study were not submitted in full, and we therefore may not have the complete outcomes and study results for these additional patients. We further note that in the studies provided, patients with 50 percent or greater TBSA burns were excluded. The applicant indicated that the product could be especially meaningful for patients with burns of 50–60 percent TBSA, but we question whether we can fully evaluate this claim because these patients were not assessed.

We are inviting public comments on whether StrataGraft™ meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for StrataGraft™ skin tissue.

r. Tecartus™ (brexucabtagene autoleucel)

Kite Pharma submitted an application for new technology add-on payment for FY 2022 for Tecartus™ (brexucabtagene autoleucel) (''Tecartus''). Tecartus is a CD19 directed genetically modified autologous T-cell immunotherapy for the treatment of adult patients with relapsed and refractory (r/r) mantle cell lymphoma (MCL). We note that Kite Pharma previously submitted an application for new technology add-on payments for Tecartus for FY 2021, as summarized in the FY 2021 IPPS/LTCH PPS proposed rule, under the name KTE–X19 (85 FR 32634).

Tecartus is a form of chimeric antigen receptor (CAR) T-cell immunotherapy that modifies the patient's own T-cells to target and eliminate tumor cells. More specifically, according to the applicant, Tecartus is a single infusion product consisting of autologous T-cells that have been engineered to express an anti-CD19 chimeric antigen receptor. According to the applicant, this therapy targets the CD19 antigen on the cell surface of normal and malignant B-cells. The applicant stated that Tecartus is different from other previously approved technologies because it has a distinct cellular product that requires a unique manufacturing process.

According to the applicant, MCL is a rare and aggressive subtype of non-Hodgkin lymphoma (NHL) with distinct characteristics[701] [702] that accounts for 3–10% of all cases of NHL in the United States and differs from diffuse large B-cell lymphoma (another subtype of NHL).[703] [704] [705]

The applicant stated that MCL has an annual incidence of 0.5 to 1 cases per 100,000 population with a male-to-female ratio of 3:1 with a median age at diagnosis for patients with MCL of 68 years.[706] MCL results from a malignant transformation of the B lymphocyle in the outer edge of a lymph node follicle (the mantle zone). Prognosis varies for r/r MCL, but the median survival for MCL is 3–5 years depending on the risk group (the Mantle Cell Lymphoma International Prognostic Index categorizes patients into low, intermediate and high risk groups), according to the applicant.[707] According to the applicant, the preferred first line therapy is bendamustine-rituximab which has decreased toxicity and improved progression-free survival as compared to rituximab with cyclophosphamide, doxorubicin, vincristine, and prednisone.[708] According to the applicant, rituximab is also the only approved therapy for maintenance for patients in remission. The applicant stated the median progression free survival ranges from 29–51 months with most of MCL patients eventually relapsing. The applicant contended that approximately 40% of patients end up with durable long-term remission after a chemoimmunotherapy first line therapy.[709] [710] [711]

The applicant indicated that there is no standard of care that exists for second-line and higher chemotherapy when a patient has relapsed or refractory MCL.[712] According to the applicant, second line therapies typically depend on the front line therapy utilized, comorbidities, the tumor's sensitivity to chemotherapy, and overall risk-benefit. According to the applicant, currently available options for second line therapy include:

Cytotoxic chemotherapy, proteasome inhibitors (PI), immunomodulatory drugs (IMiD), tyrosine kinase inhibitors, and stem cell transplant (both autologous and allogenic stem cell transplant [ASCT, allo-SCT]). According to the applicant, Bruton's tyrosine kinase (BTK) inhibitors, ibrutinib, zanubrutinib, and acalabrutinib, are common third-line therapy used for patients with r/r MCL and have shown to offer improvements over other chemotherapy-based regimens for r/r MCL patients. The applicant performed a literature review and meta-analysis of patients with r/r MCL whose disease had progressed during or following treatment with a BTK inhibitor and found that despite high initial response rates, most patients eventually developed progressive disease.

Therefore, according to the applicant, new therapeutic strategies are needed to improve the prognosis of patients with r/r MCL whose disease has not been effectively controlled with chemo-immunotherapy, stem cell transplant, and BTK inhibitors.

With respect to the newness criterion, the applicant indicated that the FDA approved the Tecartus Biologics License Application (BLA) on July 24, 2020 for the indication of the treatment of adult patients with relapsed/refractory mantle cell lymphoma (MCL). According to the applicant, Tecartus was granted Breakthrough Therapy designation for the treatment of patients with r/r MCL on June 15, 2018 and received Orphan Drug designation in 2016 for the treatment of MCL, acute lymphoblastic leukemia and chronic lymphocytic leukemia. The following ICD–10–PCS codes were established effective October 1, 2020 to identify the administration of Tecartus: XW23346 (Transfusion of brexucabtagene autoleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 6) and XW24346 (Transfusion of brexucabtagene autoleucel immunotherapy into central vein, percutaneous approach, new technology group 6).

As previously discussed, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion for substantial similarity, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, according to the applicant, Tecartus is the first CAR T-cell immunotherapy indicated for the treatment of r/r MCL. The applicant further asserted that it does not use a substantially similar mechanism of action. The applicant asserts the FDA concluded and approved Tecartus as distinct from YESCARTA® based on differences in the manufacturing process, certain product specifications and impurities, and formulation of the final products. Furthermore, the applicant stated that Tecartus is distinct from currently available CAR T-cell immunotherapies, namely YESCARTA® and KYMRIAH®, because neither prior CAR T-cell therapy is indicated for the treatment of patients with r/r MCL, and other differences include the manufacturing process, certain product specifications and impurities, and the final dose formulation as determined by the FDA. The applicant stated that MCL is a unique subtype of B-cell Non-Hodgkin's Lymphoma (NHL) and is distinct from DLBCL as determined by the 2016 WHO classification. The applicant stated it reviewed data from the FY 2019 100 percent MedPAR Hospital Limited Data Set to obtain a reference of currently available products used in the treatment of r/r MCL. The applicant stated that based on this analysis, available products used in the treatment of r/r MCL included: chemotherapies, PIs, IMiDs, or BTK inhibitors. The applicant described Tecartus as an autologous CAR T-cell immunotherapy, which genetically modifies the patient's own T-cells to target and eliminate tumor cells for the treatment of r/r MCL and asserted that because Tecartus is an autologous CAR T-cell immunotherapy, it does not use the same mechanism of action as other treatments currently used to treat r/r MCL (chemotherapies, PIs, IMiDs, or BTK inhibitors).

To further note the differences between Tecartus's mechanism of action and other available therapies for r/r MCL, the applicant stated that Tecartus represents a unique product that is customized for B-cell malignancies bearing high levels of circulating CD19-expressing tumor cells. Given these genetic modifications and differences, as previously described, the applicant described Tecartus as having a different mechanism of action from existing r/r MCL therapies.

The applicant stated that Tecartus is a distinct cellular product and is produced by a unique manufacturing process customized for B-cell malignancies characterized by circulating tumor cells and is designed to minimize the number of CD19-expressing tumor cells in the final product. The T cells in the leukapheresis product are enriched by positive selection, activated by culturing with anti-CD3 and anti-CD28 antibodies, and then transduced with a retroviral vector containing the anti-CD19 CAR gene. These engineered T cells are then propagated in culture to generate a sufficient number of cells to achieve a therapeutic effect upon infusion back into the patient. The applicant further stated that Tecartus has a different mechanism of action as compared to YESCARTA® given that the European Medicines Agency (EMA) deemed Tecartus and YESCARTA® as different products.

With respect to the second criterion for substantial similarity, whether a product is assigned to the same or a different MS–DRG, the applicant noted that CMS has established the new MS–DRG 018 (Chimeric Antigen Receptor (CAR) T-cell Immunotherapies), effective October 1, 2020, for CAR T-cell therapies. However, the applicant asserted that Tecartus will be uniquely identified by ICD–10–PCS codes different from those used to identify YESCARTA® and KYMRIAH®. As previously noted, under the current coding system, cases reporting the use of Tecartus would be coded with ICD–10–PCS codes XW23346 and XW24346, which are currently assigned to MS–DRG 018, and therefore we believe that cases reporting the use of Tecartus would be assigned to the same MS–DRG as existing CAR T-cell therapies.

With respect to the third criterion for substantial similarity, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant stated that Tecartus is the first and only CAR T-cell immunotherapy indicated for the treatment of r/r MCL which is identified by ICD–10–CM C83.1X, mantle cell lymphoma, unspecified site. The applicant noted that the patients treated by YESCARTA® and KYMRIAH® are not assigned ICD–10–CM diagnosis code C83.1X (Mantle cell lymphoma, unspecified site), as would patients treated with Tecartus. As previously mentioned, the applicant described that MCL results from a malignant transformation of a B lymphocyte in the outer edge of the lymph node follicle. The applicant further stated that diffuse large b-cell lymphoma (DLBCL), which YESCARTA® and KYMRIAH® treat, is defined as a neoplasm of large B cells arranged in a diffuse pattern. The applicant described this distinction as evidence that Tecartus treats a different subtype of NHL, r/r MCL, as compared to other FDA approved CAR T-cell therapies. However, we note that the applicant recognized in its application that MCL and DLBCL patients share

similar clinical presentation of lymphadenopathy, splenomegaly and constitutional symptoms. The applicant also noted that the disease courses for MCL and DLBCL are different given that MCL has a unique molecular pathogenesis. The applicant stated that patients with r/r MCL often present with high levels of circulating tumor cells which are inherent to the disease [713] [714] or due to peripheral mobilization of tumor cells induced by BTK inhibitor therapy.[715] According to the applicant, MCL requires a customized CAR T-cell therapy for B-cell malignancies bearing high levels of circulating CD19-expressing tumor cells in order to provide a functional autologous cellular therapy. Unlike MCL, the presence of circulating tumor cells occurs only rarely in patients with DLBCL.[716]

With respect to the first criterion, the applicant asserted that Tecartus would provide a new treatment option for adult patients with r/r MCL and therefore is not substantially similar to any existing technologies. We note that for FY 2019 (83 FR 41299), CMS approved two CD19 directed CAR T-cell therapies, YESCARTA® and KYMRIAH®, for new technology add-on payments. In regard to the mechanism of action, the applicant acknowledged that Tecartus is a form of CAR T-cell immunotherapy that modifies the patient's own T-cells, as are YESCARTA® and KYMRIAH®. However, the applicant asserted that the manufacturing process used by Tecartus makes the therapy significantly different from YESCARTA®. The applicant further asserted that its unique manufacturing process which includes a T-cell selection step for patients with MCL, ALL, and CLL is distinct from that used for the manufacture of YESCARTA® for the treatment of patients with malignancies characterized by high numbers of circulating tumor types.

Similar to our discussion of the FY 2021 application in the FY 2021 IPPS/LTCH PPS proposed rule (85 FR 32636–32637), we are concerned as to whether the differences the applicant described in the manufacturing process should be considered a different mechanism of action as compared to previous CAR T-cell therapies. We note, in their review, the FDA identified many similarities between Tecartus and YESCARTA® to include that, ''the YESCARTA® and KTE–X19 final products are very similar and are formulated identically. The same release testing methods are used for both products.'' [717] Further, as Tecartus is also a CD19-directed T-cell immunotherapy for the treatment of patients with an aggressive subtype of NHL, we continue to question whether the differences identified by the applicant would mean that Tecartus does not have a similar mechanism of action to existing CD19-directed CAR T-cell therapies. We are seeking public comment as to whether the differences the applicant described in the manufacturing process should be considered a different mechanism of action, as compared to previous CAR T-cell therapies.

With regard to the third criterion for substantial similarity, though the applicant described differences between MCL and DLBCL, the applicant also stated that patients with MCL and DLBCL share similar clinical presentation of lymphadenopathy, splenomegaly and constitutional symptoms, and they are both subtypes of NHL. We therefore question whether this therapy may involve the treatment of a similar type of disease when compared to existing CAR T-cell therapies.

We are inviting public comments on whether Tecartus is substantially similar to other technologies and whether Tecartus meets the newness criterion.

With regard to the cost criterion, the applicant searched the FY 2019 MedPAR claims data file with the FY 2019 Final Rule IPPS Impact File to identify potential cases representing patients who may be eligible for treatment using Tecartus.

The applicant identified claims that reported an ICD–10–CM diagnosis code of ICD–10–CM C83.1X (Mantle cell lymphoma, unspecified site). The applicant stated that claims reporting ICD–10–CM code C83.1X would not involve the use of the other two approved CAR T-cell therapies because those therapies are not used to treat this diagnosis, MCL. As such, the applicant stated that it used C83.1X to identify potential MCL cases and ICD–10–PCS codes XW033C3 and XW043C3 to identify patients receiving CAR T-cell therapy. In its analysis, the applicant identified two sets of cohorts (Primary Cohort and Sensitivity Analysis Cohort) to assess whether this therapy met the cost criterion. The ICD–10–PCS procedure codes listed in the following table were used to identify claims involving chemotherapy and the applicant noted that these were used for both cohorts.

ICD-10-PCS Procedure Codes Describing Chemotherapy	
ICD-10-PCS Code	**Description**
3E03002	Introduction of high-dose interleukin-2 into peripheral vein, open approach
3E03003	Introduction of low-dose interleukin-2 into peripheral vein, open approach
3E03005	Introduction of other antineoplastic into peripheral vein, open approach
3E03302	Introduction of high-dose interleukin-2 into peripheral vein, percutaneous approach
3E03303	Introduction of low-dose interleukin-2 into peripheral vein, percutaneous approach
3E03305	Introduction of other antineoplastic into peripheral vein, percutaneous approach
3E04002	Introduction of high-dose interleukin-2 into central vein, open approach
3E04003	Introduction of low-dose interleukin-2 into central vein, open approach
3E04005	Introduction of other antineoplastic into central vein, open approach
3E04302	Introduction of high-dose interleukin-2 into central vein, percutaneous approach
3E04303	Introduction of low-dose interleukin-2 into central vein, percutaneous approach
3E04305	Introduction of other antineoplastic into central vein, percutaneous approach

The applicant identified two cohorts for these analyses and used two CCRs to account for the cost of their technology. The Primary Cohort included cases with an ICD–10–CM primary diagnosis of MCL, at least one procedure code indicating receipt of chemotherapy, and no ICD–10–PCS procedure codes indicating CAR T-cell therapy. The applicant believed the Primary Cohort most closely aligned with the characteristics and health of r/r MCL patients who would receive Tecartus given that this cohort includes patients with far advanced disease (comparable to the ZUMA–2 study, as discussed later in this section). The Sensitivity Analysis Cohort included patients with the ICD–10–CM principal or secondary diagnosis of MCL, at least one procedure code indicating receipt of chemotherapy, and no ICD–10–PCS procedure codes indicating CAR T-cell therapy. For each cohort, the applicant performed two sub-analyses that varied the CCR used to calculate Tecartus charges: (1) The national pharmacy CCR of 0.187; and (2) the applicant calculated CAR T-cell CCR of 0.314.

According to the applicant, based on the primary diagnosis code and the presence of chemotherapy, these cases signify that the primary reason for hospitalization was treatment of the patient's MCL, including the complications of their advancing disease and chemotherapy-related complications, and resulted in charges and longer lengths of stay believed to be most reflective of the r/r MCL population that is treated by TECARTUS. The applicant added that this group of MCL cases with MCL as a primary diagnosis most closely compares with the characteristics and health resource utilization of r/r MCL patients that will receive TECARTUS. Furthermore, the applicant stated that the cases in the Primary Cohort had higher charges across all categories than the cases with MCL as a secondary diagnosis. The cases with MCL as a primary diagnosis are according to the applicant more reflective of the r/r MCL population as those cases were more likely being treated for the complications of their advancing disease and chemotherapy-related complications. The average length of stay for hospitalizations in the Primary Cohort was 15.1 days. Lastly, in explaining why CAR T-cell MCL cases from FY 2019 were excluded from the cost analysis, the applicant stated that they could not identify specific charges for CAR T-cell therapy, no individual revenue center had charges similar to those expected for CAR T-cell therapy, and there were no CAR T-cell therapy products approved for the treatment of MCL in FY 2019.

The applicant stated that to estimate the CAR T-cell CCR, they obtained the MS–DRG 018 arithmetic mean charge in the AOR/BOR FY 2021 Proposed Rule File released by CMS ($1,387,946). The applicant subtracted non-drug charges for TECARTUS of $201,610 (based on the TECARTUS FY 2021 new technology add-on payment application) from total arithmetic mean charge to estimate CAR T-cell charges (approximately $1,186,336). The applicant then divided a WAC of CAR T-cell therapy of $373,000 by the estimated CAR T-cell charges to estimate a charge-to-cost ratio of 0.314 (CCR = 373,000/1,186,336).

The claim search conducted by the applicant resulted in 267 claims in the Primary Cohort, mapped to 13 MS–DRGs, and 1,100 claims in the Sensitivity Analysis Cohort, mapped to 59 MS–DRGs using the FY 2019 MedPAR Hospital LDS based on the requirements for each cohort outlined by the applicant. The applicant stated that because TECARTUS cases are mapped to MS–DRG 018, the cost criterion analysis utilized the threshold for MS–DRG 018 for all MS–DRGs included in each cohort rather than the MS–DRG specific threshold. The applicant determined an average unstandardized case weighted charge per case of $1,251,126 for the Primary cohort and $1,251,126 for the Sensitivity Analysis Cohort.

BILLING CODE 4120–01–P

MS-DRGs in Primary Cohort

BILLING CODE 4120–01–C

The applicant then removed charges for prior technology. The applicant stated that the cases representing patients who had received chemotherapy, as reflected by the Medicare claims data, would generally not receive both chemotherapy and Tecartus as an inpatient because conditioning chemotherapy would be administered in the outpatient setting before the patient would be admitted for Tecartus infusion and monitoring. Otherwise, the applicant asserted that patients receiving Tecartus would be expected to incur similar charges to those cases in the Medicare claims data for patients with a primary diagnosis of MCL and receiving chemotherapy (Primary Cohort). In its analysis, the applicant noted that in the FY 2019 MedPAR Hospital LDS, charges for chemotherapy drugs were grouped with charges for oncology, diagnostic radiology, therapeutic radiology, nuclear medicine, CT scans, and other imaging services. The applicant believed that removing all radiology charges would understate the cost of adverse event (AE) clinical management for Tecartus patients needed. The applicant found that when using data from the Q4 2017 and Q1 Q3 2018 Standard Analytic files and comparing total chemotherapy charges to total radiology charges, 2 percent of radiology charges were chemotherapy charges, on average. Therefore, instead of removing all radiology charges, the applicant excluded 2 percent of the radiology charge amount to capture the effect of removing chemotherapy pharmacy charges.

The applicant then standardized the charges and applied the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges (1.13218). For the Primary and Sensitivity cohorts, the applicant performed two sub-analyses that varied the CCR used to calculate Tecartus charges: (1) using the national pharmacy CCR (0.187); and (2) using the CAR T-cell CCR (0.314).

The applicant stated that when comparing the Primary Cohort to the MS–DRG 018 average case-weighed threshold amount (based on the FY 2021 IPPS/LTCH PPS final rule) and using the national pharmacy CCR, the final inflated average case-weighted standardized charge per case of $2,207,969 exceeded the average case-weighted threshold amount of $1,251,126 by $956,843. When using the CAR T-cell CCR, the final inflated average case-weighted standardized charge per case of $1,399,653 exceeded the average case-weighted threshold amount of $1,251,126 by $148,527. The applicant stated that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the therapy meets the cost criterion.

When conducting the same review to assess cost for the Sensitivity Analysis Cohort, the applicant noted that the sensitivity analysis cohort also meets the cost criterion when compared to the MS–DRG 018 average case-weighted threshold amount (based on the FY 2021 IPPS/LTCH PPS data file thresholds for FY 2022). As reported by the applicant, when using the national pharmacy CCR in the sensitivity analysis cohort the final inflated average case-weighted standardized charge per case of $2,142,149 exceeded the average case-weighted threshold amount of $1,251,126 by $891,023. When using the CAR T-cell CCR in the sensitivity analysis cohort, the final inflated average case-weighted standardized charge per case of $1,333,833 exceeded the average case-weighted threshold amount of $1,251,126 by $82,707. The applicant stated that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the therapy meets the cost criterion. Because the final inflated average case-weighted standardized charge per case for both the Primary Cohort and the Sensitivity Analysis Cohort exceeds the average case-weighted threshold amount for MS–DRG 018, the applicant maintained that the technology meets the cost criterion. As noted in previous discussions, the submitted costs for CAR T-cell therapies vary widely due to differences in provider billing and charging practices for this therapy. Therefore, with regard to the use of this data for purposes of calculating a CAR T-cell CCR we are uncertain how representative this data is for use in the applicant's cost analyses given this potential for variability.

We continue to be interested in public comments regarding the eligibility of CAR T-cell technologies for new technology add-on payments when assigned to MS–DRG 018. As we have noted in prior rulemaking with regard to the CAR T-cell therapies (83 FR 41172 and 85 FR 58603 through 58608), if a new MS–DRG were to be created, then consistent with section 1886(d)(5)(K)(ix) of the Act, there may no longer be a need for a new technology add-on payment under section 1886(d)(5)(K)(ii)(III) of the Act.

We invite public comment on whether Tecartus meets the cost criterion based on this proposal.

With respect to the substantial clinical improvement criterion, the applicant asserted that Tecartus represents a new treatment option for an adult patient population unresponsive to, or ineligible for, currently available treatments. The applicant also believes that the use of Tecartus significantly improves clinical outcomes for a patient with r/r MCL as compared to currently available therapies, including BTK inhibitors. The applicant stated that Tecartus provides access to a treatment option for patients with r/r MCL who have not been responsive to first line or second line therapies. The applicant provided further detail regarding these

assertions, referencing the results of a Phase 2 study (Zuma-2) and historical and meta analyses, which are summarized in this section of this rule.

According to the applicant, because no effective standard therapy for subjects with r/r MCL who have progressed following a prior BTK inhibitor therapy exists, ZUMA–2 lacked a comparison arm. The applicant described how a historical control was the only ethical and feasible study design for patients with r/r MCL who had not responded to the most promising therapies available, including BTK inhibitors. Therefore, the historical control was identified from prior studies identified in a meta-analysis of six studies, which included two studies by Martin et al., (2016) and Cheah et al., (2015), and covered 255 subjects. The ORRs in these six studies ranged from 20%–42% with the applicant identifying 26% [718] and 32% [719] for use as their comparator.

According to the Martin et al. (2016) retrospective cohort study referenced by the applicant, the investigators reported best response rate (RR) to ibrutinib was 55% (43% partial response [PR], 12% complete response [CR]), with 35% of patients having a best response of progressive disease. But among patients who received subsequent therapy, local clinicians reported that 13 patients (19%) achieved PR, and 5 (7%) achieved CR. The median overall survival (OS) following cessation of ibrutinib was 2.9 months (95% confidence interval [CI], 1.6–4.9). Of the 104 patients with data available, 73 underwent at least one additional line of currently available treatment after stopping ibrutinib with a median OS of 5.8 months (95% confidence interval [CI], 3.7–10.4).[720]

A second retrospective study by Cheah et al. identified 42 (54%) who had discontinued therapy of 78 patients with MCL who had been treated at MD Anderson Cancer Center between 2011 and 2014. [721] All 42 patients had received ibrutinib with a median number of cycles of 6.5 (range 1—43). Twenty-eight patients (67%) had disease progression as the main reason for therapy discontinuation. Of the 31 patients who experienced disease progression following ibrutinib and underwent salvage therapy, the overall objective response rate (ORR) and complete response rate (CRR) was 32% and 19%, respectively. After a median follow-up of 10.7 (range 2.4–38.9) months from discontinuation of ibrutinib, the median OS among patients with disease progression was 8.4 months and the estimated one-year OS was 22.1% (95% CI 8.3% to 40.2%).

The applicant summarized further studies that featured BTK therapy. Dreyling et al. and Epperla et al. identified ORRs of 20% and 42% respectively while Wang et al. identified an ORR of 29%, CR rate of 14%, and PR rate of 15% and Jaln et al. identified an ORR of 29%, CR rate of 14%, and PR rate of 15%.[722] [723] [724] [725]

To evaluate the effectiveness of Tecartus, the applicant noted it used an ORR comparison of 25%, which was derived from two aforementioned studies (Martin et al. and Cheah et al.) with patients with r/r MCL who progressed on the most predominantly prescribed BTK inhibitor, ibrutinib. The results of these two studies showed a median OS of 5.8 months after receiving at least 1 additional line of currently available therapy to treat r/r MCL. Those who did not receive salvage therapy had a median OS of 0.8 months.[726]

According to the applicant, the ZUMA–2 study of Tecartus is the only pivotal study of CAR T-cell therapy for r/r MCL. ZUMA–2 is a multicenter, open label, Phase 2 study which evaluated the safety and efficacy of Tecartus in patients with r/r MCL that relapsed or are refractory to prior therapy, including BTK inhibitors. The primary endpoint compared the ORR from the study to the ORR 25% historical control at a one-sided alpha level of 0.025. The applicant stated that ZUMA–2 was not designed to compare the efficacy and safety of TECARTUS to BTK inhibitors, and the results of ZUMA–2 are not intended to indicate that TECARTUS should definitively be utilized to replace any existing therapies. Participants were required to have received prior treatment for MCL, no more than five prior regimens, which must have included anthracycline (or bendamustine containing chemotherapy), an anti-CD20 monoclonal antibody and BTK inhibitor. The ZUMA–2 study included 68 subjects treated with Tecartus out of 75 patients enrolled. The safety analysis included a review of all 68 subjects, with the primary analysis of efficacy reviewing the first 60 subjects treated with Tecartus. ZUMA–2 was conducted at 20 sites in the United States and Europe. Of the 60 subjects in the primary analysis set, 59 were from U.S. sites. Of the 68 subjects in the safety analysis set, 62 were from U.S. sites. Among the 68 subjects, the median age was 65 years (range 38–79) and 57 subjects (84%) were male. Additionally, 58 subjects (85%) had stage IV disease. The sample had a median of 3 prior therapies with 55 (81%) having received ≥3 prior therapies. In addition, 43% had relapsed after a prior autologous stem cell transplant (ASCT); the remaining subjects had either relapsed after or were refractory to their last therapy for MCL.

The applicant asserted that the use of Tecartus significantly improves clinical outcomes for a patient population as compared to currently available treatments. The applicant contended that ibrutinib, a BTK inhibitor, is the most common third-line therapy used for patients with r/r MCL [727] [728] and has been shown to offer improvements over other chemotherapy-based regimens for r/r MCL patients. The applicant also referenced a more selective BTK inhibitor, acalabrutinib, which was approved in the US for the treatment of patients with r/r MCL.[729] [730] In registrational trials, the ORR and CRR were 66% and 17%, respectively for ibrutinib, and 81% and 40%, respectively, for acalabrutinib.[731] [732] The

applicant contended that primary and secondary resistance to BTK inhibitors [733] is common, and subsequent therapies currently available are minimally effective.[734] [735] [736]

Among the 68 patients treated in the ZUMA–2 study, the primary efficacy analysis was conducted after 60 patients had been enrolled, treated, and evaluated for response for six months after the week four disease assessment. Based on the primary analysis of the 60 subjects included in the ZUMA–2 study, there was an ORR of 93% after a single dose of Tecartus (56 of 60 subjects with a 95% CI of 83.8%, 98.2%). The applicant reported that the complete response rate was 67% (40 of 60 subjects with a 95% CI of 53.3%, 78.3%). The applicant noted the ORR of 93% and CR 67% were observed across age groups (94% ages ≥65; 93% ages <65 and, of the 40 subjects achieving CR, 22 subjects were aged ≥65 and 18 were aged <65). The applicant highlighted that the ORR of 93% was significantly higher than the prespecified historical control rate of 25%. Furthermore, the applicant noted that among the 42 subjects who initially had a partial response (PR) or stable disease (SD), 24 subjects (57%) went on to achieve a CR after a median of 2.2 months (range: 1.8 to 8.3 months). Twenty-one subjects converted from PR to CR, and 3 subjects converted from stable disease (SD) to CR.

According to the applicant, the median DOR was not reached with a median follow-up time for DOR of 8.6 months (95% CI: 7.8, 19.6 months) with a median study follow-up of 12.3 months; this result was consistent across age groups. Kaplan-Meier estimates of the progression free survival (PFS) rates at 6 months and 12 months were 77.0% and 60.9%, respectively, and the median PFS was not reached at the median potential follow-up of 12.3 months. Additionally, 57% of all patients and 78% of patients with a CR remained in remission (results consistent across age groups). Furthermore, as reported by the applicant, among the first 28 subjects studied as part of the interim analysis, 43% remained in continued remission without additional therapy at the follow-up period of 27 months (range, 25.3–32.3).

The applicant also conducted an additional analysis of OS among the first 28 subjects (ZUMA–2 interim analysis) who were treated with Tecartus and had a potential follow-up of ≥24 months. Among these subjects, the OS rate estimate at 24 months was 67.9% and the median OS was not reached. In comparison, the Cheah et al. (2015) post-ibrutinib salvage therapy study reported a lower one-year survival rate of 22%. Additionally, among the subjects in CR at month 3 who had the opportunity to be followed to month 12, 90% remained in CR at month 12. The applicant contended that this statistic showcased that early responses to Tecartus are likely indicative of long-term remission after the single infusion of Tecartus. Furthermore, the applicant suggested that a substantial number of patients with r/r MCL treated with Tecartus will achieve a CR, and that this suggests these patients will likely experience a long-term remission after a single infusion of Tecartus. The applicant also noted that these results were consistent across age groups at the time of the primary data analysis cut-off (July 24, 2019). By contrast, the applicant noted that patients with r/r MCL who had prior BTK inhibitor treatment had CR rates ranging from 7–22%. Additionally, the applicant noted that the majority of patients on BTK inhibitor treatment go on to have progressive disease given that the responses achieved with currently available salvage therapies are short lived and have a DOR ranging from 3 to 5.8 months.[737] [738] [739] [740]

With regard to the safety of Tecartus, the applicant argued that the ZUMA–2 study demonstrated a positive benefit-risk of Tecartus over the current therapy options for patients with r/r MCL. The applicant stated that the toxicity profile that is associated with Tecartus therapy can be managed based upon established guidance. The applicant further stated that the risk evaluation and mitigation strategies (REMS) program will ensure that hospitals providing Tecartus therapy are certified so that all who prescribe, dispense, or administer Tecartus are aware of how to manage the risk of cytokine release syndrome (CRS) and neurologic events. However, the applicant notes that patients who were ≥65 years old showed a trend toward a higher incidence of Grade 3 or higher CRS compared to those ≤65 years old. (21% versus 7%). Additionally, all subjects in the ZUMA–2 primary analysis had at least one adverse event (AE), 99% of subjects had at least one AE that was Grade 3 or higher, and 68% of subjects had at least one serious adverse event (SAE). Among all 68 treated patients, the most common Grade 3 or higher AEs were anemia (51%), neutropenia (53%), and leukopenia (41%). Furthermore, CRS occurred in 62 subjects (91%) in the ZUMA–2 safety analysis. Of these, 10 subjects (15%) had Grade 3 CRS or higher. No subject had Grade 5 CRS, according to the applicant. Furthermore, according the applicant, the most common CRS symptoms of any grade were pyrexia, hypotension, and hypoxia. The most common Grade 3 or higher CRS symptoms were hypotension (35 subjects, 51%), hypoxia (23 subjects, 34%), and pyrexia (62 subjects, 91%). No patient in the ZUMA–2 study treated with Tecartus died from CRS.

The applicant mentioned that 43 of the 68 patients (63%) in the ZUMA–2 study also experienced forms of neurologic events. Of these, 15 subjects (22%) had a worst Grade 3 neurologic event, and 6 subjects (9%) had a worst Grade 4 neurologic event. Twenty-two subjects (32%) had serious neurologic events, however, the applicant noted no subject had a Grade 5 neurologic event. The most common neurologic events of any grade were encephalopathy (21 subjects, 31%), confusional state (14 subjects, 21%), and tremor (24 subjects, 35%). Compared with subjects who were <65 years of age, subjects who were ≥65 years of age showed a trend toward a higher incidence of Grade 3 or higher neurologic events (36% versus 24%). The applicant noted that these neurologic events resolved for all but 6 subjects and that among those whose neurologic events had resolved, the median duration was 12 days. Additionally, no patient died from neurologic events.

In response to CMS's concern as discussed in the FY 2021 IPPS/LTCH PPS proposed rule (85 FR 32646–32647) regarding the generalizability of the findings from ZUMA–2 to the general Medicare population, the applicant stated that the ZUMA–2 study sample is representative of the Medicare population. The applicant stated that 57% of the sample were 65 to 79 years of age, and that MCL predominantly affects older adults, with a median age at diagnosis ranging from 65 to 73.[741] [742] The applicant asserted that the advanced disease characteristics, including Stage IV disease in 85%, bone marrow involvement in 54%, and splenic involvement in 34%, closely align with those observed in the general MCL population where newly diagnosed and previously untreated patients present with stage III/IV disease and commonly exhibit splenomegaly and bone marrow infiltration.[743] The applicant added that the key baseline characteristics of the ZUMA–2 population mirror the r/r MCL Medicare population refractory to BTK inhibitors, including age of study subjects and stage of disease at study initiation. Overall, ZUMA–2 primary results showed that at the time of the analysis cutoff (July 2019), 16 of 68 subjects (24%) had died; 4 deaths occurred >30 days through 3 months after infusion of Tecartus and 12 deaths occurred ≥3 months after infusion of Tecartus. Fourteen of the 16 subjects died as a result of progressive disease and two of the 16 subjects died due to AEs (Grade 5 AE of staphylococcal bacteremia and Grade 5 AE of organizing pneumonia).

Based on the information provided by the applicant, we have several concerns with regard to the substantial clinical improvement criterion. As we noted in the FY 2021 IPPS/LTCH PPS proposed rule, the combined sample size from the literature search and ZUMA–2 study performed by the applicant is relatively small. While the applicant stated that it closely communicated with FDA in the development of the ZUMA–2 study, including in the development of the sample size, we question whether the ZUMA–2 study results would support a determination of substantial clinical improvement given the small sample size. Although the applicant's analysis of the ZUMA–2 study concluded that Tecartus offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments, we question whether the sample size and research presented in this application support extrapolating these results across the Medicare population.

Relatedly, we have concerns regarding the potential for selection bias and its effects on results from the ZUMA–2 study. Seventy-four patients were enrolled in the trial and underwent leukapheresis, of which Tecartus was successfully manufactured for 71 (96%) and administered for 68 (92%).[744] According to the authors, the primary efficacy analysis was performed among the 60 first treated patients who had at least 7 months of follow up. We also note that the reported ORR among the first 60 is 93% (95% CI 84–98) and the ORR among all 74 patients enrolled is 85%. We have concerns, given the small sample, about the potential effects of selection bias and of patients being selected out of a study on the results of ZUMA–2, which forms the keystone of the applicant's assertions regarding substantial clinical improvement. Further, some research suggests that trials stopped early for benefit overestimate treatment effects [745] [746] [747] and that formal stopping rules do not reduce this bias, particularly in samples less than 500 events or cases.[748] Given the lack of confidence intervals around the ORR among all 74 patients and the potential for the overestimation of treatment effects, it is unclear whether there is sufficient information to determine a substantial clinical improvement.

As noted in the FY 2021 IPPS/LTCH PPS proposed rule, there has not been a direct study completed comparing outcomes of patients with r/r MCL treatment with Tecartus and BTK inhibitors. According to the applicant, ZUMA–2 remains the only study to evaluate patient outcomes after receiving Tecartus for the treatment of r/r MCL, but this study does not include a direct comparison to other existing therapies for r/r MCL. Despite there being no standard of second-line care for r/r MCL patients that failed on previous therapies, according to the applicant, a BTK inhibitor reflects the best currently available therapy for treating r/r MCL.[749]

The applicant's assertions of substantial clinical improvement are based on the ZUMA–2 trial that uses a historical control ORR of 25%. Given that the ORR in the provided literature review of six articles ranges from 20%–42%, and that, according to the applicant, two specific articles were used to develop the pre-specified historical control rate (26% [750] and 32% [751] respectively), it is unclear whether the historical control is appropriate or representative of r/r MCL patients. Furthermore, given that the applicant states that ZUMA–2 was not designed to compare efficacy and safety of Tecartus to BTK inhibitors, we are uncertain whether it would support a determination of substantial clinical improvement.

As noted in the FY 2021 IPPS/LTCH PPS proposed rule, a longer-term analysis of this population is not available to evaluate the overall survival and mortality data. We note that the applicant did conduct an additional analysis of OS among the first 28 subjects (ZUMA–2 interim analysis) which showed an OS rate estimate at 24 months of 67.9% while the median OS was not reached. Additionally, the applicant referenced that all subjects in the ZUMA–2 primary analysis had at least 1 adverse event, and that throughout the course of the ZUMA–2 study, 16 deaths were recorded. However, while the applicant noted only 2 of these 16 deaths were related to adverse events, we remain concerned that further analysis may be needed to evaluate the safety of Tecartus and the longer term effects of the CRS and neurological events associated with the Tecartus therapy.

We are inviting public comments on whether Tecartus meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New

Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for Tecartus.

s. TERLIVAZ® (Terlipressin)

Mallinckrodt Pharmaceuticals submitted an application for new technology add-on payments for TERLIVAZ® (terlipressin) for FY 2022. Per the applicant, TERLIVAZ® is for intravenous use in the treatment of adults with hepatorenal syndrome type 1 (HRS–1). The applicant stated that TERLIVAZ® (Nα-tryglycl-8-lysine-vasopressin) is a pro-drug for the endogenous/natural porcine hormone [Lys8]-vasopressin and a synthetic vasopressin analog derived from the natural/endogenous human hormone [Arg8]-vasopressin.[752] According to the applicant, TERLIVAZ® has greater selectivity for the vasopressin receptors (V1) versus vasopressin receptors (V2) and inhibits portal hypertension with simultaneous reduction of blood circulation in portal vessels.[753] The applicant stated that the V1 receptor mediated vasoconstrictor activity of TERLIVAZ®, particularly in the splanchnic area, results in an increase in effective arterial volume, an increase in mean arterial pressure (MAP), and normalization of endogenous vasoconstrictor systems (renin-angiotensin-aldosterone and sympathetic nervous system) resulting in increased renal blood flow.[754]

The applicant described HRS–1 as a serious, life-threatening condition characterized by development of acute or sub-acute renal failure in patients with advanced chronic liver disease (CLD). The applicant stated that HRS–1 is estimated to affect between 30,000 and 40,000 patients in the U.S. annually [755] [756] and is the leading cause of hospitalizations among all patients with advanced CLD.[757] The applicant asserted that the high mortality and significant rates of HRS–1–related readmissions support the need for better disease awareness and more effective treatment options.[758] [759] [760] The applicant asserted that there are currently no FDA-approved medications available in the US indicated specifically for the treatment of HRS–1,[761] but several agents are used off-label. The applicant stated that in the U.S., the standard of care and initial treatment for HRS–1 is a combination of midodrine and octreotide, which are used off-label.[762] [763] According to the applicant, this combination is concomitantly administered with albumin. The applicant also stated that in patients who are admitted to the ICU, initial treatment with norepinephrine, also used off-label, in combination with albumin is recommended.[764] The applicant stated that the ideal therapy for HRS–1 is improvement of liver function from either recovery of alcoholic hepatitis, treatment of decompensated hepatitis B with effective antiviral therapy, recovery from acute hepatic failure, or liver transplantation.[765] According to the applicant, TERLIVAZ® is approved as the first-line treatment for HRS–1 in European and Asian countries under appropriate marketing authorizations in those countries.[766]

With respect to the newness criterion, the applicant stated that in 2005, a New Drug Application (NDA) filing for TERLIVAZ® was granted Fast Track designation by the FDA and was considered under Priority Review in May 2008, but a Complete Response Letter (CRL) was issued by the FDA in November 2009. A CRL indicates that the review cycle for an application is complete and that the application is not ready for approval (73 FR 39588). The applicant also stated that in 2016, Mallinckrodt Pharmaceuticals and the FDA reached agreement on their trial protocol design and data analysis under the agency's special protocol assessment (SPA) process. In April 2020, the applicant submitted the current NDA application with FDA as a Class 2 resubmission of the original NDA. On July 15, 2020, the Cardiovascular and Renal Drugs Advisory Committee of the FDA voted to recommend approval of the investigational agent TERLIVAZ® to treat adults with HRS–1, but on September 14, 2020, Mallinckrodt received a CRL from the FDA for this NDA. At the time of the development of this proposed rule, TERLIVAZ® had not received FDA marketing authorization. The applicant submitted a request for a unique ICD–10–PCS code to identify the intravenous infusion of TERLIVAZ®.

As discussed previously, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or similar mechanism of action to achieve a therapeutic outcome, according to the applicant, there are currently no FDA-approved treatments for HRS–1 that have a mechanism of action of selectivity for vasopressin V1 receptors. The applicant also stated that TERLIVAZ® represents a different compound type, vasoconstrictor class, and mechanism of action than those of currently available off-label treatments for HRS–1. The applicant submitted the following table that compares the mechanism of action for TERLIVAZ® to the mechanism of action for existing technologies used off-label to treat HRS–1 including midodrine, octreotide, and norepinephrine.

Selected Characteristics Of Drugs Used For The Treatment Of HRS-1				
	TERLIVAZ	**Midodrine[767]**	**Octreotide[768]**	**Norepinephrine[769]**
Compound Type	Vasopressin analogue	α-adrenergic agonist	Somatostatin analogue	α-adrenergic agonist
Vasoconstricor class	Nonsympathomimetic	Sympathomimetic	Sympathomimetic	Sympathomimetic
Receptor binding	V1 vasopressin receptor	α1 receptor	Somatostatin receptor	α1, α2 receptors
Mechanism of action	Selective affinity for vasopressin V1 receptors predominantly located in smooth muscles of arterial vasculature in the splanchnic region. Provides vasoconstrictor and antidiuretic properties to elevate arterial pressure.	Binds to α1 adrenoceptors on peripheral vascular smooth muscle, promoting smooth muscle contraction.	Used with midodrine to activate α1 adrenergic receptors of the arteriolar and venous vasculature, producing an increase in vascular tone and elevation of blood pressure[770].	Binds to α1 adrenoceptors on peripheral vascular smooth muscle, promoting peripheral vasoconstriction.

With respect to the second criterion, whether a product is assigned to the same or a different MS–DRG, the applicant stated that TERLIVAZ® may be assigned to the same MS–DRG as existing technologies currently used to treat HRS–1. In particular, the applicant stated that cases involving the use of Terlivaz® may map to the three MS–DRGs included in Major Diagnostic Category (MDC) 7 (Diseases & Disorders of the Hepatobiliary System & Pancreas); MS–DRG 441—Disorders of Liver Except Malignancy, Cirrhosis or Alcoholic Hepatitis with CC; MS–DRG 442—Disorders of Liver Except Malignancy, Cirrhosis or Alcoholic Hepatitis with CC; and MS–DRG 443—Disorders of Liver Except Malignancy, Cirrhosis or Alcoholic Hepatitis without CC/MCC. The applicant stated that although TERLIVAZ® may be assigned to the same MS–DRG when compared with an existing technology, this does not mean that TERLIVAZ® is not new for the purposes of new technology add-on payments because, according to the applicant, the existing technologies are not specifically indicated for the treatment of HRS–1. The applicant stated that none of the current standard-of-care drugs used to treat HRS–1, namely midodrine, octreotide, and norepinephrine are FDA-approved for the treatment of this disease. The applicant referenced the discussion in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49445) of BLINCYTO®, as an example of another technology that was the only FDA-approved product available on the U.S. market to treat the relevant indication, and stated that CMS agreed that eligible cases involving the BLINCYTO technology would map to a different MS–DRG than cases treated with similar technologies. The applicant also stated that the MS–DRG system does not differentiate between patients with HRS and non-HRS conditions that are assigned to the three MS–DRGs included in Major Diagnostic Category (MDC) 7 (Diseases & Disorders of the Hepatobiliary System & Pancreas) and further that the current MS–DRGs do not differentiate between HRS type 1 and type 2. The applicant states that because of this, both TERLIVAZ® and an existing technology used to treat non-HRS conditions of HRS type 2 may be assigned to MS–DRGs 441, 442, and 443.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, according to the applicant, TERLIVAZ® will treat the same type of disease but will not treat the same or similar population when compared to existing technologies currently treating HRS–1 in the U.S. The applicant stated that TERLIVAZ® will offer treatment to a new patient population that is a subset of the larger patient population for which TERLIVAZ® will receive an FDA label, if approved, and that this subset includes patients for which existing technologies offer a lower rate of recovery of renal function compared to TERLIVAZ®. The applicant states that while the FDA label for TERLIVAZ® will not be reserved for a subset of the patient population that has been diagnosed with HRS–1 and has failed to respond to standard-of-care treatment options, it does not logically follow that because of this label, TERLIVAZ® will not offer a treatment option to a new patient population.

Based on the applicant's statements as summarized above, the applicant believes that TERLIVAZ® is not substantially similar to other currently available therapies and/or technologies and meets the ''newness'' criterion. We note that while TERLIVAZ® may address an unmet need because it will be the first treatment indicated specifically for the treatment of HRS–1, the applicant's assertion that TERLIVAZ® involves the treatment of a different patient population on the basis that there is a lower rate of renal function recovery using standard of care treatments does not necessarily support the unmet need for HRS–1 treatment. We are inviting public comments on whether TERLIVAZ® is substantially similar to other technologies and whether TERLIVAZ® meets the newness criterion.

With respect to the cost criterion, the applicant searched the FY 2018 MedPAR dataset for cases reporting the ICD–10–CM code K76.7—Hepatorenal syndrome. The applicant stated that average covered charges were obtained at the provider level and case counts for provider instances with fewer than 11

[770] Cavallin M, Kamath PS, Merli M, et al. Terlipressin plus albumin versus midodrine and octreotide plus albumin in the treatment of hepatorenal syndrome: a randomized trial. Hepatology. 2015;62:567–574.

discharges at the MS–DRG level were redacted and replaced with the number 1. The applicant initially identified 2,592 providers and 35,806 cases. The applicant excluded 315 providers and 1,149 cases that were not listed in the Impact File FY 2021 Proposed Rule, as the average charges for these cases/providers could not be standardized. The applicant further stated that there were initially 255 MS–DRGs in the data set. However, three MS–DRGs were not found in FY 2022 New Technology Thresholds file posted with the FY 2021 IPPS final rule and correction notice, and an additional three MS–DRGs were excluded because providers were not listed in the Impact File FY 2021 Proposed Rule. The exclusion of those 6 MS–DRGs resulted in an additional 6 excluded cases. Thus, the final data set for analysis included 34,651 cases spanning across a total of 249 MS–DRGs.

The applicant then presented six analyses with defined cohorts. The applicant considered the following factors in defining the cohorts:

- The applicant explained that, because HRS is not always the primary or admitting diagnosis in cases where ICD–10–CM code K76.7 is present, and that K76.7 is commonly coded to cases such as sepsis, they included cases where HRS is the primary and/or admitting diagnosis code in cohorts 1, 3, and 5 and cases where HRS can be the primary, the admitting, or any secondary diagnosis in cohorts 2, 4, and 6.
- The applicant stated that it filtered out cases without a 2-day minimum length of inpatient stay. Per the applicant, the ICD–10–CM diagnosis code K76.7 covers type 1 and type 2 HRS. The applicant stated that HRS type 1 and type 2 have clinical differentiators that make HRS–1 the condition requiring greater hospital resource utilization to treat. The applicant stated that, to produce a cost threshold calculation for an indication of HRS–1, HRS–2 cases must be redacted from any inpatient case population used to ensure charge averages are not dampened by lower costs to treat cases not described by an HRS–1 indication. The applicant explained that HRS–1 is diagnosed by the exclusion of other causes of acute kidney injury in cirrhotic patients, and that no response to 2 consecutive days of diuretic withdrawal and volume expansion with albumin is one of the diagnostic criteria in patients with cirrhosis. Accordingly, per the applicant, patients who do not fulfill this criterion within 48 hours cannot be considered HRS–1 cases and were excluded from the analysis.
- The applicant also stated that the clinical presentation of HRS–1 means the more serious cases requiring stabilization will be treated in the ICU and other cases will be treated in the general medical ward. The applicant included cases with an ICU indicator for Cohorts 1 and 2, representing serious cases where the patient needed stabilization procedures and/or conditions needing immediate attention. The applicant stated that these could be conditions related to, caused by, or leading to the HRS diagnosis or having no relationship to HRS other than a concurrent presence. The applicant also included cases without an ICU indicator for cohorts 3 and 4 and included all cases without differentiation in ICU utilization for cohorts 5 and 6.

Cohort	Cohort Description	Number of Cases	Number of MS-DRGs
1	ICD-10-CM code - K76.7 primary/admitting, ICU indicator, stays of 2+ days only	759	34
2	ICD-10-CM code - K76.7 any position, ICU indicator, stays of 2+ days only	8,915	197
3	ICD-10-CM code - K76.7 primary/admitting, no ICU indicator, stays of 2+ days only	801	38
4	ICD-10-CM code - K76.7 any position, no ICU indicator, stays of 2+ days only	7,154	210
5	ICD-10-CM code - K76.7 primary/admitting, stays of 2+ days only	1,526	51
6	ICD-10-CM code - K76.7 any position, stays of 2+ days only	15,496	249
		Total: 34,651	

The applicant then removed the charges for the technology being replaced. For analyses 1 and 2, the applicant removed the estimated cost of generic norepinephrine based on HRS–1 dosing regimens from each case, which was $1,699 (AnalySource 2018 U.S. Pricing). For analyses 3 and 4, the applicant removed the estimated cost of midodrine plus octreotide based on HRS–1 dosing regimens from each case, which was $3,391 (AnalySource 2018 U.S. Pricing). For analyses 5 and 6, the applicant removed the estimated cost of generic norepinephrine ($1,699) from ICU cases and the estimated cost of midodrine plus octreotide ($3,391) from non-ICU cases.

Across all analyses, the applicant standardized the charges and applied a 2-year inflation factor of 13.1 percent that the applicant stated was used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges. We note that the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges is 1.13218, which would have increased the inflated charges. The applicant stated that it did not add any charges for and related to the new technology or any charges related to the prior technologies.

In the first analysis, (Cohort 1), the applicant computed a final inflated average case-weighted standardized charge per case of $135,189, which exceeded the average case-weighted threshold amount of $70,629.

In the second analysis, (Cohort 2), the applicant computed a final inflated average case-weighted standardized charge per case of $181,617, which exceeded the average case-weighted threshold amount of $88,445.

In the third analysis, (Cohort 3), the applicant computed a final inflated average case-weighted standardized charge per case of $59,184, which exceeded the average case-weighted threshold amount of $56,994.

In the fourth analysis, (Cohort 4), the applicant computed a final inflated average case-weighted standardized

charge per case of $66,974, which exceeded the average case-weighted threshold amount of $63,976.

In the fifth analysis, (Cohort 5), the applicant computed a final inflated average case-weighted standardized charge per case of $96,783, which exceeded the average case-weighted threshold amount of $63,738.

In the sixth analysis, (Cohort 6), the applicant computed a final inflated average case-weighted standardized charge per case of $132,324, which exceeded the average case-weighted threshold amount of $78,101.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount under all analyses, the applicant asserted that the technology meets the cost criterion. However, based on the information provided by the applicant, we have the following concerns regarding the cost criterion. We question whether the analyses conducted by applicant may include MS–DRGs that are defined by other factors and which may or may not be related to the intended indication for TERLIVAZ®. Per the applicant, on average, MS–DRGs 441 and 442, used for disorders of the liver, covered 83.41 percent of cases included in cohorts where HRS is the primary and/or admitting diagnosis code, and may therefore be a more refined representation of current reimbursement for cases of HRS–1. We also note that the applicant identified cases using the FY 2018 MedPAR dataset instead of the FY 2019 MedPAR dataset. We invite public comments on whether TERLIVAZ® meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserts that TERLIVAZ® represents a substantial clinical improvement over existing technologies because the use of TERLIVAZ® is associated with a more rapid resolution of the HRS–1 disease process and a reduced rate of mortality compared to placebo, midodrine and octreotide, and norepinephrine. The applicant also stated that the use of TERLIVAZ® is associated with a decreased rate of several subsequent diagnostic or therapeutic interventions, compared with placebo and the overall benefit-risk profile of TERLIVAZ® as a treatment for HRS–1 is favorable.

In support of the claim that the use of TERLIVAZ® is associated with a more rapid resolution of the HRS–1 disease process and a reduced rate of mortality compared to placebo, the applicant submitted a PowerPoint presentation that discussed the results of the CONFIRM study. The CONFIRM study[771] was a randomized (2:1), double-blind, placebo-controlled study comparing TERLIVAZ® to placebo in 300 adult patients, 18 years of age or older with HRS–1 (defined as rapidly progressive worsening in renal function to a serum creatinine (SCr) ≥2.25 mg/dL and meeting a trajectory for SCr to double over 2 weeks). TERLIVAZ® or placebo were administered as a 1 mg IV bolus injection every 6 hours for a maximum of 14 days.

The primary objective of the study was to confirm the efficacy and safety of TERLIVAZ® versus placebo in the treatment of adult subjects with HRS–1 receiving standard of care albumin therapy. The primary endpoint was the incidence of verified HRS reversal, defined as 2 consecutive serum creatinine values ≤1.5 mg/dL at least 2 hours apart, while on treatment by Day 14 or discharge, whichever came first (on treatment defined as up to 24 hours after the final dose of study drug). In order to be counted in the primary endpoint, patients needed to be alive without renal replacement therapy (RRT) for at least 10 days after achieving verified HRS reversal. RRT was defined as any procedure to replace nonendocrine kidney function and included intermittent hemodialysis, ultrafiltration, continuous hemofiltration and hemodialysis, peritoneal dialysis, and other dialysis and filtration techniques. The secondary endpoints and their definitions are listed in the following table. The statistical analysis plan also specified that the secondary endpoints were to be tested using the Hochberg procedure to control the overall type 1 error rate.[772] A sample size calculation was conducted and found that a sample size of 300 subjects would provide approximately 90% power with a two-sided type 1 error rate of 0.05 with a 2:1 randomization and assuming event rates of verified HRS reversal of approximately 28% and 12.5%.

Secondary Endpoints	
Secondary Endpoint[773]	**Definition**
Incidence of subjects with HRS-1 reversal	Percentage of subjects with a SCr value ≤1.5 mg/dL while on treatment by Day 14 or discharge. SCr values after RRT, transjugular intrahepatic portosystemic shunt (TIPS), liver transplant, or open-label vasopressor use were excluded
Durability of HRS-1 reversal	Percentage of subjects with HRS reversal without RRT to Day 30
Incidence of HRS-1 reversal in SIRS (systemic inflammatory response syndrome) subgroup	HRS-1 reversal was defined as percentage of subjects with a SCr value ≤1.5 mg/dL while on treatment by Day 14 or discharge The SIRS subgroup was identified based on meeting ≥2 of the following criteria: white blood cell count 12,000 cells/μL, heart rate >90 bpm, temperature >38°C or 20/min, and bicarbonate level
Incidence of verified HRS-1 reversal without HRS-1 recurrence by Day 30	HRS-1 recurrence was defined as rapidly progressive worsening in renal function to SCr ≥2.25 mg/dL without sustained improvement in renal function at least 48 hours after diuretic withdrawal and beginning of plasma volume expansion with albumin

[771] U.S. Food and Drug Administration. Terlipressin Briefing Document. NDA # 022231. Cardiovascular and Renal Drugs Advisory Committee, July 15, 2020. *https://www.fda.gov/media/139963/download*. Accessed February 17, 2021.

[772] Ibid.

The applicant [773] stated that the incidence of verified HRS reversal was 29.1 percent (n=58) in the TERLIVAZ® (treatment) group and 15.8 percent (n=16) in the placebo (control) group (p=0.012).[774] According to the applicant, the incidence of subjects with HRS–1 reversal was 36.2 percent (n=72) in the treatment group and 16.8 percent (n=17) in the control group (p<0.001). The durability of HRS–1 reversal was 31.7 percent (n=63) in the treatment group and 15.8 percent (n=16) in the control group (p=0.003). The incidence of HRS–1 reversal in SIRS subgroup was 33.3 percent (n=28) in the treatment group and 6.3 percent (n=3) in the control group (p <0.001). According to the applicant, the incidence of verified HRS–1 reversal without HRS–1 recurrence by Day 30 was 24.1 percent (n=48) in the treatment group and 15.8 percent (n=16) in the control group (p=0.092). The applicant also claimed that the overall survival up to Day 90 was higher in responders (subjects who achieved verified HRS reversal or HRS reversal while receiving treatment) than in non-responders (p<0.001) in both the treatment and control groups.[775]

The applicant asserted that the study conducted by Arora et al.[776] supports its claims that the use of TERLIVAZ® is associated with a more rapid resolution of the HRS–1 disease process and a reduced rate of mortality compared to norepinephrine. This study was an open-label, randomized controlled trial conducted as a single-center study in India. The study compared a continuous infusion of TERLIVAZ® and albumin to a continuous infusion of norepinephrine and albumin in the management of HRS-acute kidney injury (AKI) in patients with a diagnosis of acute on chronic liver failure (ACLF). Patients were randomized to receive either TERLIVAZ® or norepinephrine in a 1:1 ratio.[777]

ACLF is a distinct diagnosis where, because of severe acute hepatic injury, a rapid loss of liver function develops in a patient with previous chronic liver disease. In this study, ACLF was defined as an acute hepatic insult manifesting as jaundice (serum bilirubin ≥5 mg/dL) and coagulopathy (international normalized ratio [INR] ≥1.5) complicated within 4 weeks by ascites and/or encephalopathy in a patient with previously diagnosed or undiagnosed chronic liver disease or cirrhosis. HRS–AKI was defined as ICA–AKI stage ≥II when other causes of AKI were excluded and the patient was nonresponsive to volume expansion with intravenous albumin.

A total of 120 patients were randomized and 60 patients were allocated to the intention to treat group for both the TERLIVAZ® and norepinephrine arms. Adverse events requiring discontinuation of the drug were reported in 9 of 60 (15%) patients in the TERLIVAZ® arm compared to 5 of 60 (8.3%) in the norepinephrine arm (P=0.39). These events included diarrhea, abdominal pain, atrial fibrillation, cyanosis, and chest pain in the TERLIVAZ® arm. In the norepinephrine arm, patients experienced the previously mentioned adverse events as well as ventricular premature complex (VPCs) and hypertension. The per protocol analysis included 51 patients in the TERLIVAZ® arm and 55 patients in the norepinephrine arm. A response rate of 56% for TERLIVAZ®, a response rate of 43% for norepinephrine, and a 10% noninferiority margin was assumed. For an alpha level of 5 percent and power of 80 percent, it was determined that 57 patients were needed in each arm.

According to the applicant, the results showed that a higher percentage of patients achieved HRS reversal at day 14 (primary endpoint) in the TERLIVAZ® group compared to the norepinephrine group in both the intention to treat analysis (ITT) and per-protocol analysis (PPA) (ITT 40 percent (n=24) vs. 16.7 percent (n=10); p=0.004; PPA 43.13 percent (n=22) vs. 16.3 percent (n=9); p=0.002). Complete response was defined as return of serum creatinine (SCr) to a value within 0.3 mg/dL of baseline.

In support of its claims that TERLIVAZ® is associated with a more rapid resolution of the HRS–1 disease process and a reduced rate of mortality compared to midodrine and octreotide, the applicant summarized the results of the Cavallin et al. study,[778] which compared TERLIVAZ® plus albumin versus midodrine and octreotide plus albumin in a multi-center randomized controlled trial. Patients in the study were from eight hospitals in Italy. The researchers hypothesized a response rate of 60 percent for TERLIVAZ® and of 30 percent for midodrine plus octreotide (MID/OCT), with an alpha error of 5 percent and power of 80 percent. An interim analysis after enrollment of half the sample size set a stopping rule for the randomized clinical trial if the difference in recovery of renal function was significant at P<0.01. The study was terminated after 49 patients were included according to the a priori determined stopping rule. The applicant stated that the results showed that improvement of renal function was significantly more frequent in patients randomized to the TERLIVAZ® group compared to patients randomized to the MID/OCT group; 70.4 percent of patients in the TERLIVAZ® group had a complete or partial response compared with 28.6 percent in the MID/OCT group (p=0.01); 55.5 percent of patients in the TERLIVAZ® group had a complete response compared with 4.8 percent of the MID/OCT group (p<0.001). Complete response was defined as a decrease in serum creatinine to ≤133 µmol/L (≤1.5 mg/dL). Partial response was defined as a ≥50% serum creatinine decrease from baseline to a final value >133 µmol/L (>1.5 mg/dL). No response was defined as a serum creatinine decrease of <50% from baseline.

In this study, some nonresponders to the assigned treatment received a rescue treatment according to the treating physician's decision. Seven of 12 (58.3 percent) nonresponders in the MID/OCT group received a rescue treatment: Six received TERLIVAZ® plus albumin, and one received dialysis. An improvement of renal function was observed in five of six patients (83.3 percent) who received TERLIVAZ® plus albumin. Four patients had a complete response and one patient had a partial response.

In support of its claim that TERLIVAZ® is associated with a decreased rate of subsequent diagnostic or therapeutic interventions, compared with placebo, the applicant cited the results of the CONFIRM trial. The applicant noted that there was a lower incidence of renal replacement therapy through the treatment period (14 days) in patients receiving TERLIVAZ® (23.1 percent (n=46)) versus the placebo (34.7 percent (n=35)). The applicant also stated that there was a decreased incidence of renal replacement therapy (RRT) after liver transplant in patients treated with TERLIVAZ® (19.6 percent

[776] Arora V, Maiwall R, Rajan V, et al. Terlipressin Is Superior to Noradrenaline in the Management of Acute Kidney Injury in Acute on Chronic Liver Failure. Hepatology. 2019;71(2):600–610.

[777] Ibid.

[778] Cavallin M, Kamath PS, Merli M, et al. Terlipressin plus albumin versus midodrine and octreotide plus albumin in the treatment of hepatorenal syndrome: a randomized trial. Hepatology. 2015;62:567–574.

(n=46)) versus 44.8 percent (n=29) in the placebo group (p=0.04). The applicant stated that the need for RRT post-transplant is predictive of poor graft function and survival.[779] The applicant also claimed that patients receiving TERLIVAZ® stayed an average of 6.4 days in the ICU versus 13.2 days in the placebo group.

In support of its assertion that the overall benefit-risk profile of TERLIVAZ® as a treatment for HRS–1 is favorable, the applicant cited the results of the CONFIRM trial. The applicant noted that the overall incidence of adverse events (AEs) and serious adverse events (SAEs) were similar between patients receiving TERLIVAZ® (n=200) and those receiving placebo (n=99). Further, the applicant stated that 88.0 percent (n=176) of patients receiving TERLIVAZ® reported AEs versus 88.9 percent (n=88) in the placebo group and that 65.0 percent (n=130) of patients receiving TERLIVAZ® reported SAEs versus 60.6 percent (n=60) in the placebo group. The applicant also claimed that the majority of AEs associated with TERLIVAZ® are predictable, recognizable, and generally manageable in the hospital setting where HRS–1 patients are treated.

Finally, the applicant asserted that TERLIVAZ® represents a substantial clinical improvement because the totality of the circumstances otherwise demonstrates that TERLIVAZ® substantially improves, relative to technologies previously available, the treatment of Medicare beneficiaries. The applicant stated that HRS–1 is a serious, life-threatening condition characterized by development of acute or sub-acute renal failure in patients with advanced CLD. The applicant further emphasized that HRS–1 is the leading cause of hospitalizations among all patients with advanced CLD; therefore, inpatient care management of patients with HRS–1 is time and resource intensive, representing a significant cost to hospitals.[780] Finally, the applicant reiterated that upon FDA approval, TERLIVAZ® will be the only FDA-approved drug for the HRS–1 indication that aligns with the European Association for the Study of the Liver (EASL) treatment guidelines for HRS–1: ''Terlipressin plus albumin should be considered as the first-line therapeutic option for the treatment of HRS–AKI.'' [781]

In our assessment of the applicant's claims in support of substantial clinical improvement, we have the following concerns. Regarding the CONFIRM trial, we note that at the time of development of this proposed rule, this study has not been published and we would appreciate access to additional or more robust materials to facilitate further review of the CONFIRM trial results. We note that the proportion of patients with verified HRS reversal without HRS recurrence by Day 30 was numerically greater in the TERLIVAZ® arm, but the difference between groups was not statistically significant (24 percent vs 16 percent, p=0.09) [782] and we note that the potential for HRS–1 recurrence among patients treated with TERLIVAZ® after 30 days is unclear. We also note that, though the applicant claimed a reduction in mortality with the use of TERLIVAZ®, the mortality rate at Day 90 was higher in the TERLIVAZ® group vs the placebo group (51 percent vs 44.4 percent).[783] We further note that the applicant states that survival was not defined as a primary or secondary analysis in the CONFIRM trial and that no overall survival benefit was observed in the CONFIRM trial because survival is confounded by multiple co-morbidities in patients with HRS–1.[784] We note that the primary endpoint of the CONFIRM trial used a surrogate endpoint of serum creatinine as an indicator of HRS reversal, and we question whether this correlates to improvements in clinical outcomes such as mortality and time to transplant. With regard to the applicant's claims regarding a similar incidence of adverse events and serious adverse events between groups in the CONFIRM trial, we note that the results show that the TERLIVAZ® arm had a higher incidence of SAEs up to 30 days post-treatment related to respiratory failure, serious infections such as sepsis and septic shock, GI bleeding, and abdominal pain. Additionally, 61 percent (17⁄28) of respiratory events in the treatment arm were fatal versus 20% (1⁄5) in the placebo arm.[785] Regarding the study conducted by Arora et al., we note that this study had an open-label design and included patients with a diagnosis of ACLF as well as HRS–AKI which may have contributed to the differences observed between the TERLIVAZ® arm and the norepinephrine arm in this study.[786] Finally, we note that the results of the Cavallin et al study submitted by the applicant in support of a substantial clinical improvement over midodrine and octreotide show that there was no survival benefit for the TERLIVAZ® group at months one and three.[787]

We welcome public comment on whether TERLIVAZ® meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for TERLIVAZ®.

s. VEKLURY® (remdesivir)

Gilead Sciences, Inc. submitted an application for new technology add-on payments for VEKLURY® (remdesivir) for FY 2022. VEKLURY® is a nucleotide analog that inhibits viral RNA-dependent RNA polymerases, demonstrating activity countering viral pathogens such as severe acute respiratory syndrome coronavirus 2 (SARS–CoV–2), the virus that causes coronavirus disease 2019 (COVID–19).

According to the applicant, spread of COVID–19 is presumed largely to occur through respiratory droplets and approximately 80% is predicted to occur by pre- and asymptomatic

individuals. The applicant asserted viral incubation averages 3–7 days and can occur for up to 2 weeks.[788] According to the applicant, once infected, approximately 81% of COVID–19 patients experience mild disease, 14% experience severe disease, and 5% experience critical disease.[789] The applicant stated that severity of disease changes with age—approximately 113 in 100,000 people aged 18–49 years are hospitalized, compared to 250 in 100,000 aged 50–64 years and 451 in 100,000 aged 65+.[790] The applicant asserted that other risk factors for severity include underlying comorbidities but severe illness can occur in otherwise healthy individuals at any age.[791]

According to the applicant, patients who present to the hospital with evidence of pneumonia may require supplemental oxygen in severe cases, or, those with critical illness may develop hypoxemic respiratory failure, acute respiratory distress syndrome, and multiorgan failure that requires ventilation support.[792] The applicant cited one study of 2,482 hospitalized COVID–19 patients, in which 32% of patients were admitted to the intensive care unit (ICU) for a median stay of 6 days and 19% received invasive mechanical ventilation, 53% of whom died in the hospital.[793]

According to the applicant, VEKLURY® received FDA approval for use in the inpatient setting on October 22, 2020 via Priority Review and had received Fast Track designation.[794] Under the New Drug Application (NDA) FDA approval, VEKLURY® is indicated for adults and pediatric patients (12 years of age and older and weighing at least 40 kg) for the treatment of COVID–19 requiring hospitalization.[795] [796] Prior to its approval, on May 1, 2020, VEKLURY® received an Emergency Use Authorization (EUA) from FDA for the treatment of suspected or laboratory-confirmed COVID–19 in adults and children hospitalized with severe disease.[797] VEKLURY® continues to have an EUA for pediatric patients (12 years of age or younger weighing at least 3.5 kg or weighing 3.5 kg to less than 40 kgs) for emergency use to treat suspected or laboratory-confirmed COVID–19 in hospitalized pediatric patients.[798] [799]

According to the applicant, VEKLURY® has been available under the EUA since it was first issued in May 2020 for emergency use in the inpatient setting for patients with COVID–19. The applicant asserted that between July 1, 2020 and September 30, 2020, it entered into an agreement with the U.S. Government to allocate and distribute commercially-available VEKLURY® across the country.[800] The applicant stated that under this agreement, the first sale of VEKLURY® was completed on July 10, 2020. The applicant stated that they transitioned to a more traditional, unallocated model of distribution as of October 1, 2020.

According to the applicant, as of August 1, 2020, VEKLURY® is uniquely identified by ICD–10–PCS codes XW033E5 (Introduction of remdesivir anti-infective into peripheral vein, percutaneous approach, new technology group 5) and XW043E5 (Introduction of remdesivir anti-infective into central vein, percutaneous approach, new technology group 5). Prior to August 1, 2020, the generic, non-COVID–19 ICD–10–PCS codes 3E033GC (Introduction of other therapeutic substance into peripheral vein, percutaneous approach) and 3E043GC (Introduction of other therapeutic substance into central vein, percutaneous approach) could be reported for the use of VEKLURY®.

As discussed previously, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome, the applicant asserted VEKLURY® is a SARS–CoV–2 nucleotide analog RNA polymerase inhibitor, and that there are no other antiretroviral therapies that have received an EUA or an approval from FDA to treat COVID–19. The applicant stated, however, that convalescent plasma has also received an EUA for the treatment of hospitalized patients with COVID–19.[801] [802] According to the applicant, convalescent plasma is collected from individuals who have been infected with SARS–CoV–2 and have developed antibodies to the virus. The applicant stated that plasma is transfused into infected patients with the expectation that the antibodies present will neutralize the virus.[803] The applicant asserted this mechanism of action is different from VEKLURY® which works as a nucleotide analog to inhibit viral replication. We note that, as a result of their evaluation of the most recent information available, on February 4, 2021 FDA reissued the EUA for convalescent plasma. The EUA authorizes only the use of high titer COVID–19 convalescent plasma, for the treatment of hospitalized patients early in the course of disease. The use of low titer COVID–19 convalescent plasma is not authorized under the EUA.[804]

[804] FDA reissued the EUA on March 9, 2021. FDA In Brief: FDA Updates Emergency Use Authorization for COVID–19 Convalescent Plasma

Continued

We note that another inpatient treatment for COVID–19, Olumiant® (baricitinib), in combination with VEKLURY®, has received an EUA. Specifically, the EUA for Olumiant®, which should be administered in combination with VEKLURY®, is for the treatment of COVID–19 in certain hospitalized patients requiring supplemental oxygen, invasive mechanical ventilation, or extracorporeal membrane oxygenation (ECMO).[805] Olumiant® is a Janus kinase (JAK) inhibitor with prior FDA approval for another indication—the treatment of adult patients with moderately to severely active rheumatoid arthritis who have had inadequate response to one or more tumor necrosis factor (TNF) antagonist therapies.[806]

According to the applicant, because of the rapidly evolving nature of the COVID–19 pandemic, there is not a current standard of care used across hospitals in the United States.

With regard to the second criterion, whether the technology is assigned to the same or a different MS–DRG, the applicant asserted that as there no other antiretroviral therapies for the treatment of patients with COVID–19, VEKLURY® could not be assigned to the same MS–DRG as existing technologies.

With regard to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant asserted VEKLURY® represents a novel treatment option for patients with COVID–19 who are hospitalized. The applicant stated COVID–19 is a completely separate disease from those caused by other coronaviruses. The applicant asserted severe acute respiratory syndrome (SARS) is caused by the coronavirus SARS–CoV and was first reported in 2003. The applicant stated SARS symptoms were similar to COVID–19 and included high fever, body aches, and mild respiratory symptoms but no treatments specific to SARS–CoV have been developed.[807] According to the applicant, MERS–CoV, the Middle east respiratory syndrome coronavirus, was first identified in 2012 and has some similarities in etiology to SARS–CoV–2 but lacks treatment options.[808]

Based on the applicant's statements as summarized previously, the applicant believes that VEKLURY® is not substantially similar to other currently available therapies and/or technologies and meets the ''newness'' criterion. We note that although there may not be other antiretrovirals available for the treatment of COVID–19, cases involving VEKLURY® may map to the same MS–DRGs as other treatments for COVID–19. We also note that VEKLURY® may not treat a different disease or patient population as existing treatments for COVID–19, as Olumiant® (administered with VEKLURY®) and convalescent plasma appear to treat the same disease and similar patient population.

In the FY 2009 IPPS final rule (73 FR 48561 through 48563), we revised our regulations at § 412.87 to codify our longstanding practice of how CMS evaluates the eligibility criteria for new medical service or technology add-on payment applications. We stated that new technologies that have not received FDA approval do not meet the newness criterion. In addition, we stated we do not believe it is appropriate for CMS to determine whether a medical service or technology represents a substantial clinical improvement over existing technologies before the FDA makes a determination as to whether the medical service or technology is safe and effective. For these reasons, we first determine whether a new technology meets the newness criterion, and only if so, do we make a determination as to whether the technology meets the cost threshold and represents a substantial clinical improvement over existing medical services or technologies. We also finalized at 42 CFR 412.87(c) (subsequently redesignated as 412.87(e)) that all applicants for new technology add-on payments must have FDA approval or clearance by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered.

In the FY 2021 IPPS/LTCH PPS final rule, to more precisely describe the various types of FDA approvals, clearances, licensures, and classifications that we consider under our new technology add-on payment policy, we finalized a technical clarification to § 412.87(e)(2) to indicate that new technologies must receive FDA marketing authorization (for example, pre-market approval (PMA); 510(k) clearance; the granting of a De Novo classification request; approval of a New Drug Application (NDA); or Biologics License Application (BLA) licensure) by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. As noted in the FY 2021 IPPS/LTCH PPS final rule, this technical clarification did not change our longstanding policy for evaluating whether a technology is eligible for new technology add-on payment for a given fiscal year, and we continue to consider FDA marketing authorization as representing that a product has received FDA approval or clearance for purposes of eligibility for the new technology add-on payment under § 412.87(e)(2) (85 FR 58742).

An EUA by the FDA allows a product to be used for emergency use, but under our longstanding policy, we believe it would not be considered an FDA marketing authorization for the purpose of new technology add-on payments, as a product that is available only through an EUA is not considered to have FDA approval or clearance. Therefore, under the current regulations at 42 CFR 412.87(e)(2) and consistent with our longstanding policy of not considering eligibility for new technology add-on payments prior to a product receiving FDA approval or clearance, we believe a product available only through an EUA would not be eligible for new technology add-on payments. Therefore, cases involving hospitalized pediatric patients (12 years of age or younger weighing at least 3.5 kg or weighing 3.5 kg to less than 40 kgs) receiving VEKLURY® for emergency use to treat suspected or laboratory-confirmed COVID–19 would not be eligible for new technology add-on payment, if VEKLURY® is approved for new technology add-on payment for the patient population indicated in its FDA approval.

We refer the reader to our comment solicitation in section II.F.7 of the preamble of this proposed rule regarding how data reflecting the costs of a product with an EUA, which may become available upon authorization of the product for emergency use (but prior to FDA approval or clearance), should be considered for purposes of the 2-year to 3-year period of newness for new technology add-on payments for a product with or expected to receive an EUA, including whether the newness period should begin with the date of the EUA.

We also invite public comments on any implications of the distribution agreement described previously with regard to the market availability of VEKLURY® .

---

We also refer the reader to our proposal in section II.F.8 of the preamble of this proposed rule to extend the new COVID–19 treatments add-on payment (NCTAP) through the end of the fiscal year in which the PHE ends for certain products and discontinue NCTAP for products approved for new technology add-on payments in FY 2022.

We invite public comments on whether VEKLURY® meets the newness criterion.

With regard to the cost criterion, the applicant used the FY 2019 MedPAR LDS and the February through June 2020 Electronic Data Interchange (EDI) transaction data to identify applicable cases. The applicant used the FY 2022 thresholds and the FY 2019 NPRM IPPS/LTCH impact file to standardize charges. As COVID–19 is an emergent disease, the applicant asserted that FY 2019 MedPAR claims may not be reflective of actual cases. Accordingly, and as summarized below, the applicant identified the FY 2019 MedPAR cases as proxy COVID–19 cases in its cost analysis. To supplement and confirm its MedPAR findings, the applicant used EDI data that includes actual COVID–19 cases from February through June 2020 to capture what the applicant described as true COVID–19 MS–DRG mapping and charges.

For the MedPAR LDS cases, the applicant used B97.29 with a manifestation code (J12.89 or J20.8 or J40 or J22 or J98.8 or J80). According to the applicant, this is based on the CDC guidance which specifies use of B97.29 with additional coding to identify the manifestation prior to the April 1, 2020 COVID–19 code. The applicant developed 3 sensitivity scenarios to further differentiate the MedPAR cases; Scenario 1: All Proxy COVID–19, Scenario 2: Proxy COVID–19 without ventilation, and Scenario 3: Proxy COVID19 with ventilation. Next, the applicant analyzed linked 837 and 835 inpatient EDI transaction sets that were processed February through June of 2020. The 837 and 835 transaction sets are updated daily and stored in the Inovalon provider research datasets, accounting for approximately 5–7% of the total Medicare FFS volume nationally on average. For cases prior to April 1, the applicant used the same coding as the MedPAR analysis. For claims on or after April 1, 2020, the applicant used the actual COVID–19 code U07.1. The applicant then identified cases using the 3 sensitivity scenarios; Scenario 4: All COVID–19, Scenario 5: COVID–19 without ventilation, and Scenario 6: COVID–19 with ventilation.

The claim search conducted by the applicant identified 1,726 cases mapping to 25 MS–DRGs for scenario one, 274 cases mapping to eight MS–DRGs for scenario two, 1,393 cases mapping to 21 MS–DRGs for scenario three, 3,826 cases mapping to 21 MS–DRGs for scenario four, 859 cases mapping to seven MS–DRGs for scenario five, and 2,917 cases mapping to 14 MS–DRGs for scenario six. The MS–DRGs identified in each scenario are listed in the following tables.

BILLING CODE 4120–01–P

List of Identified MS-DRGs With Volumes Higher Than 10 Cases For Scenario 1: All Proxy COVID-19	
MS-DRG	**Description**
871	Septicemia or Severe Sepsis without Mv >96 Hours with MCC
193	Simple Pneumonia & Pleurisy with MCC
202	Bronchitis & Asthma with CC/MCC
189	Pulmonary Edema & Respiratory Failure
190	Chronic Obstructive Pulmonary Disease with MCC
291	Heart Failure & Shock with MCC or Peripheral Extracorporeal Membrane Oxyg
194	Simple Pneumonia & Pleurisy with CC
191	Chronic Obstructive Pulmonary Disease with CC
208	Respiratory System Diagnosis with Ventilator Support <=96 Hours
870	Septicemia or Severe Sepsis with Mv >96 Hours or Peripheral Extracorporea
177	Respiratory Infections & Inflammations with MCC
872	Septicemia or Severe Sepsis without Mv >96 Hours without MCC
853	Infectious & Parasitic Diseases with O.R. Procedure with MCC
195	Simple Pneumonia & Pleurisy without CC/MCC
207	Respiratory System Diagnosis with Ventilator Support >96 Hours or Periphe
166	Other Resp System O.R. Procedures with MCC
203	Bronchitis & Asthma without CC/MCC
205	Other Respiratory System Diagnoses with MCC
682	Renal Failure with MCC
308	Cardiac Arrhythmia & Conduction Disorders with MCC
192	Chronic Obstructive Pulmonary Disease without Cc/MCC
292	Heart Failure & Shock with CC
178	Respiratory Infections & Inflammations with CC
698	Other Kidney & Urinary Tract Diagnoses with MCC
280	Acute Myocardial Infarction, Discharged Alive with MCC

List of Identified MS-DRGs with Volumes Higher Than 10 Cases for Scenario 2: Proxy COVID-19 with Ventilation	
MS-DRG	**Description**
871	Septicemia or Severe Sepsis without Mv >96 Hours w MCC
208	Respiratory System Diagnosis with Ventilator Support <=96 Hours
189	Pulmonary Edema & Respiratory Failure
870	Septicemia or Severe Sepsis with Mv >96 Hours or Peripheral Extracorporea
291	Heart Failure & Shock with MCC or Peripheral Extracorporeal Membrane Oxyg
207	Respiratory System Diagnosis with Ventilator Support >96 Hours or Periphe
193	Simple Pneumonia & Pleurisy with MCC
190	Chronic Obstructive Pulmonary Disease with MCC

List of Identified MS-DRGs with Volumes Higher Than 10 Cases for Scenario 3: Proxy COVID-19 without Ventilation	
MS-DRG	**Description**
871	Septicemia or Severe Sepsis without Mv >96 Hours w MCC
193	Simple Pneumonia & Pleurisy w MCC
202	Bronchitis & Asthma with CC/MCC
190	Chronic Obstructive Pulmonary Disease with MCC
194	Simple Pneumonia & Pleurisy with CC
189	Pulmonary Edema & Respiratory Failure
291	Heart Failure & Shock with MCC or Peripheral Extracorporeal Membrane Oxyg
191	Chronic Obstructive Pulmonary Disease with CC
872	Septicemia or Severe Sepsis without Mv >96 Hours without MCC
177	Respiratory Infections & Inflammations with MCC
195	Simple Pneumonia & Pleurisy without CC/MCC
203	Bronchitis & Asthma without CC/MCC
853	Infectious & Parasitic Diseases with O.R. Procedure with MCC
205	Other Respiratory System Diagnoses with MCC
178	Respiratory Infections & Inflammations with CC
292	Heart Failure & Shock with CC
192	Chronic Obstructive Pulmonary Disease without CC/MCC
280	Acute Myocardial Infarction, Discharged Alive with MCC
166	Other Resp System O.R. Procedures with MCC
682	Renal Failure with MCC
308	Cardiac Arrhythmia & Conduction Disorders with MCC

List of Identified MS-DRGs with Volumes Higher Than 10 Cases for Scenario 4: All COVID-19	
MS-DRG	**Description**
177	Respiratory Infections & Inflammations with MCC
871	Septicemia or Severe Sepsis without Mv >96 Hours with MCC
870	Septicemia or Severe Sepsis with Mv >96 Hours or Peripheral Extracorporea
207	Respiratory System Diagnosis with Ventilator Support >96 Hours or Periphe
178	Respiratory Infections & Inflammations with CC
208	Respiratory System Diagnosis with Ventilator Support <=96 Hours
193	Simple Pneumonia & Pleurisy with MCC
179	Respiratory Infections and Inflammations without CC/MCC
004	Tracheostomy with Mv >96 Hours Or Principal Diagnosis Except Face, Mouth and Neck without Major O.R.
194	Simple Pneumonia & Pleurisy with CC
853	Infectious & Parasitic Diseases with O.R. Procedure with MCC

List of Identified MS-DRGs with Volumes Higher Than 10 Cases for Scenario 4: All COVID-19	
MS-DRG	**Description**
377	Gastrointestinal Hemorrhage with MCC
640	Miscellaneous Disorders of Nutrition, Metabolism, Fluids and Electrolytes with MCC
682	Renal Failure with MCC
981	Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC
291	Heart Failure & Shock with MCC or Peripheral Extracorporeal Membrane Oxyg
480	Hip and Femur Procedures Except Major Joint with MCC
637	Diabetes with MCC
689	Kidney and Urinary Tract Infections with MCC
195	Simple Pneumonia & Pleurisy without CC/MCC
698	Other Kidney & Urinary Tract Diagnoses with MCC

List of Identified MS-DRGs with Volumes Higher Than 10 Cases for Scenario 5: COVID-19 and Ventilation	
MS-DRG	**Description**
870	Septicemia or Severe Sepsis with Mv >96 Hours or Peripheral Ecmo
207	Respiratory System Diagnosis with Ventilator Support >96 Hours or Peripheral Ecmo
871	Septicemia or Severe Sepsis without Mv >96 Hours with MCC
208	Respiratory System Diagnosis with Ventilator Support <=96 Hours
177	Respiratory Infections & Inflammations with MCC
004	Tracheostomy with Mv >96 Hours or Principal Diagnosis Except Face, Mouth and Neck without Major O.R.
853	infectious & Parasitic Diseases with O.R. Procedure with MCC

List of Identified MS-DRGs with Volumes Higher Than 10 Cases for Scenario 6: COVID-19 without Ventilation	
MS-DRG	**Description**
177	Respiratory Infections & Inflammations with MCC
871	Septicemia or Severe Sepsis without Mv >96 Hours with MCC
178	Respiratory Infections & Inflammations with CC

BILLING CODE 4120–01–C

The applicant determined an average unstandardized case weighted charge per case of $56,643 for Scenario 1; $82,733 for Scenario 2; $51,100 for Scenario 3; $75,891 for Scenario 4; $131,004 for Scenario 5; and $59,393 for Scenario 6.

The applicant stated that 33 percent of the length of stay charges from relevant cases were removed as charges for and related to the prior technologies in order to estimate the potential decrease in length of stay achieved by use of VEKLURY®. The applicant stated that these length of stay charges were removed from relevant cases to conservatively estimate the potential reduction in charges due to decreased length of stay through use of VEKLURY®. The applicant asserted that this offset was determined based on findings from the Adaptive COVID–19 Treatment Trial (ACTT–1), which found those treated with VEKLURY® had a median recovery time of 10 days, as compared with 15 days for those who received placebo.

After calculating the average standardized charge per case for all scenarios, the applicant calculated the standardized charge per case for each MS–DRG. Next, for the analysis involving MedPAR, the applicant indicated that it applied the 2-year inflation factor used in the FY 2021 IPPS/LTCH PPS final rule to calculate outlier threshold charges of 13.1 percent. We note that the inflation factor used in the FY 2021 IPPS/LTCH PPS final rule was 13.2 percent (1.13218) (85 FR 59039), which would have increased the inflated charges. For the analysis involving the EDI, the applicant used an inflation factor of 1.06353 or 6.4%, which it indicated was the same inflation factor used in the FY 2021 IPPS/LTCH PPS final rule (85 FR 59039). We note that the inflation factor used in the FY 2021 IPPS/LTCH PPS final rule was 6.4% (1.06404) (85 FR 59039), but this does not affect the cost analysis. To calculate the charges for the technology, the applicant used the national average CCR for the Drugs cost center of 0.187 from the FY 2021 Final IPPS rule. Lastly, the applicant calculated the case-weighted threshold amount and the final inflated average case-weighted standardized charge per case for each scenario.

The applicant stated that for Scenario 1, the final inflated average case-weighted standardized charge per case of $69,741 exceeded the average case-weighted threshold amount of $56,643 by $13,098. For Scenario 2, the final inflated average case-weighted standardized charge per case of $107,860 exceeded the average case-weighted threshold amount of $82,733 by $25,127. For Scenario 3, the final inflated average case-weighted standardized charge per case of $60,749 exceeded the average case-weighted threshold amount of $51,100 by $9,649. For Scenario 4, the final inflated average case-weighted standardized charge per case of $110,553 exceeded the average case-weighted threshold amount of $75,891 by $34,662. For Scenario 5, the final inflated average case-weighted standardized charge per case of $203,406 exceeded the average case-weighted threshold amount of $131,004 by $72,402. For Scenario 6, the final inflated average case-weighted standardized charge per case of $63,915

exceeded the average case-weighted threshold amount of $59,393 by $4,522.

The applicant stated that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, VEKLURY® meets the cost criterion.

We invite public comment on whether VEKLURY® meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that VEKLURY® represents a substantial clinical improvement over existing technologies because it shortens time to recovery in patients hospitalized with severe COVID–19. The applicant also asserted that it represents a substantial clinical improvement because the technology results in improved clinical status and a trend toward reduced mortality, with the most significant reduction seen in a post-hoc analysis of patients with COVID–19 on low-flow oxygen treated with VEKLURY®. The applicant further asserted VEKLURY® results in better clinical status for patients hospitalized with moderate COVID–19.

As stated above, the applicant asserted that VEKLURY® represents a substantial clinical improvement over existing technologies because it shortens time to recovery in patients hospitalized with severe COVID–19. To support this claim, the applicant referenced published, peer-reviewed results from the ACTT–1 study, a multi-center, multi-country adaptive, double-blinded, placebo-controlled, randomized clinical trial. Patients with confirmed COVID–19 and evidence of lung involvement were randomly assigned to receive either VEKLURY® (n=532; 200 mg loading dose on day 1, followed by 100 mg daily for up to 9 additional days) or placebo (n=516) for up to 10 days. Patients could receive other treatments if a participating hospital had a written policy or guideline for treating COVID–19. The study was conducted in 60 trial sites across the world with a majority of trial sites within the United States (45 trial sites plus 13 sub-sites within the United States). The other sites were in Denmark (8), the United Kingdom (5), Greece (4), Germany (3), Korea (2), Mexico (2), Spain (2), Japan (1), and Singapore (1). The primary outcome measure of the ACTT–1 study was time to recovery, defined as the first day, from the time of enrollment into the study, that patients exhibited improvement in conditions based on hospitalization activity limitation, oxygen requirement, and medical care requirement.[809]

According to the applicant, as part of the trial design, an interim analysis was planned to determine if the study should be stopped early for futility, efficacy, or safety, if there was clear and substantial evidence of a treatment difference between study drug and placebo. An independent data and safety monitoring board met to review interim data and determined VEKLURY® was better than a placebo for the primary endpoint, time to recovery.[810] The applicant stated those treated with VEKLURY® had a median recovery time of 10 days, as compared with 15 days for those who received placebo (rate ratio for recovery, 1.29; 95% confidence interval [CI], 1.12 to 1.49; P<0.001), and the number of serious adverse events was lower in the VEKLURY® treated group.[811]

As stated previously, the applicant asserted VEKLURY® represents a substantial clinical improvement over existing technologies because use of VEKLURY® results in improved clinical status and reduced mortality in patients with COVID–19 on low-flow oxygen. According to the applicant, the pivotal ACTT–1 study showed an overall trend toward reduction in mortality with the most significant reduction observed in a post-hoc analysis of patients on low-flow oxyen treated with VEKLURY®. The overall mortality effect was not statistically significant. The applicant stated those treated with VEKLURY® continued to receive oxygen for fewer days (median, 13 days vs. 21 days) and the incidence of new oxygen use was lower in the VEKLURY® group (incidence, 36%; 95% CI, 26% to 47%) compared with the placebo group (incidence, 44%; 95% CI, 33% to 57%). In the post-hoc analysis, those receiving low-flow supplemental oxygen (that is, not those receiving noninvasive ventilation or high-flow oxygen, nor those receiving invasive mechanical ventilation or ECMO) treated with VEKLURY® had the largest reduction in mortality compared to the same cohort receiving the placebo (hazard ratio, 0.30; 95% CI, 0.14 to 0.64).[812]

As stated previously, the applicant asserted VEKLURY® results in better clinical status for patients hospitalized with moderate COVID–19. To support this claim, the applicant referenced published, peer-reviewed results from an open label, placebo controlled, randomized clinical trial. Patients with moderately severe COVID–19 (pulmonary infiltrates on imaging but oxygen saturation >94 percent on room air) were randomly assigned to receive either VEKLURY® plus continued standard of care for 10 days (n=197), VEKLURY® plus continued standard of care for 5 days (n=199), or continued standard of care (n=200). Standard of care could include use of concomitant medications such as steroids, hydroxychloroquine/chloroquine, lopinavir-ritonavir, tocilizumab, and azithromycin. The median time to start VEKLURY® treatment was 8 days after start of symptoms. The median length of treatment in the 10-day group was actually 6 days. Patients who improved could be discharged from the hospital before completing their assigned course of treatment. The study was conducted in 105 trial sites in the United States, Europe and Asia. The primary end point was assessment of clinical status on day 11 after initiation of treatment. Clinical status was assessed on a 7-point ordinal scale ranging from death (category 1) to discharged (category 7).[813]

According to the applicant, on day 11, patients with moderate COVID–19 treated with VEKLURY® for 5 days had a better clinical status compared with the standard of care (odds ratio 1.65; 95% CI, 1.09 to 2.48, P=0.02). The applicant stated the difference was not statistically significant between those treated with VEKLURY® for 10 days compared with the standard of care (P=0.18 by Wilcoxon rank sum test; the proportional odds assumption was not met for this comparison). The applicant asserted that post hoc analyses demonstrated improved clinical status in both the 5- and 10-day treated cohorts at 14 days (P=.03 for both groups). The applicant stated there were no significant differences in adverse events for those treated with Veklury for 5 days.[814]

We note that the articles submitted by the applicant in support of substantial

[814] Ibid. Spinner CD, Gottlieb RL, Criner GJ, et al. Effect of Remdesivir vs Standard Care on Clinical Status at 11 Days in Patients With Moderate COVID–19 A Randomized Clinical Trial. *JAMA.* 2020; 342(11):1048–1057.

clinical improvement used study designs that may be subject to bias, such as the adaptive and open label design. The ACTT–1 study included a prespecified interim analysis as part of its adaptive design but no changes were made to the placebo arm. We are unclear whether this may suggest that VEKLURY® did not demonstrate superiority over the control. We also note the ACTT–1 study showed considerable differences between geographic regions in median time to recovery for patients assigned to VEKLURY® compared to those assigned to placebo. For example, for the patient population studied at U.S. sites, the median time to recovery in the VEKLURY® group (n=310) vs. the placebo group (n=271) was 11 days vs. 16 days, respectively, whereas at non-US sites, patients treated with VEKLURY® (n=89) vs. placebo (n=81) experienced a median time to recovery of 8 vs. 12 days, respectively.[815] Furthermore, the ACTT–1 study allowed other simultaneous treatments based on individual hospital policies or guidelines, which may have potentially confounded the results of the trial.

We are inviting public comments on whether VEKLURY® meets the substantial clinical improvement criterion.

In this section, we summarize and respond to written public comments received in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for VEKLURY®.

Comment: The applicant responded to questions elicited by its presentation at the New Technology Town Hall Meeting held in December 2020.

First, the applicant was asked to provide information on adverse events and readmissions specifically in patients over 65 years with co-morbidities. The applicant stated that in the pivotal ACTT–1 study, the incidence of overall adverse events was similar among participants ≥65 years of age in both the VEKLURY® and placebo groups (VEKLURY® 65.6%; placebo: 69.7%).[816] The applicant asserted that reported clinical experience has not identified differences in responses between patients over 65 years old and patients under 65 years old and no dosage adjustment is required in patients over the age of 65 years. The applicant stated the NDA for VEKLURY® notes that ''appropriate caution should be exercised in the administration of Veklury and monitoring of elderly patients, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.'' [817] According to the applicant, subanalyses of readmission rates among participants who were at least 65 years of age with comorbidities have not been conducted because the overall rate of readmission is too low for any subanalyses to be meaningful. The applicant stated that in the ACTT–1 study overall, readmittance was reported in 26 participants (5%) in the VEKLURY® group and in 15 participants (3%) in the placebo group.

Second, the applicant was asked to comment on findings of the World Health Organization (WHO)-sponsored SOLIDARITY trial. According to the applicant, the SOLIDARITY trial is an ongoing, multi center, open-label global trial that was designed to (1) provide access to treatments that the WHO expert groups recommended for mortality studies and (2) collect in-hospital mortality data from a large number of participants without posing a significant burden on overstressed healthcare systems. The applicant stated that the trial prioritizes broad access to investigational treatments, particularly in countries where ongoing trials of these treatments were not available, resulting in significant heterogeneity in trial adoption, implementation, controls, and patient populations.

According to the applicant, interim results from the WHO study were published in the *New England Journal of Medicine* (NEJM) on December 2, 2020.[818] The applicant stated that between March 22, 2020 and October 4, 2020, 11,330 adult participants were enrolled at 405 hospitals in 30 countries with vastly different healthcare systems. Of these, 2,743 participants were treated with VEKLURY® and 2,708 were designated as the VEKLURY® control group (received local standard of care only without placebo). The primary endpoint of mortality at Day 28 was 12.5% in the VEKLURY® group and 12.7% in the standard of care group (Kaplan-Meier rate ratio: 0.95 [95% CI: 0.81 to 1.11; p=0.50]). The authors also reported progression to ventilation and time to discharge as secondary endpoints. At the time of the interim analysis, 11.9% in the VEKLURY® group and 11.5% in the standard of care group had progressed to mechanical ventilation and there were no differences between the VEKLURY® and standard of care groups in time to discharge. None of the three drugs evaluated definitively reduced mortality (overall or in any subgroup), initiation of ventilation, or duration of hospitalization.

The applicant stated concerns that the data from WHO's open-label global trial has limitations in light of the trial design. According to the applicant, the variations in the clinical settings of some countries may result in heterogeneity in local standards of care, access to earlier care, or access to mechanical ventilation, which could account for the high observed mortality rate in ventilated patients in SOLIDARITY. Additionally, the applicant stated that lack of detail on the level of oxygen support (low versus high), duration of symptom onset prior to randomization, and the number of VEKLURY® doses administered precludes subanalyses that could elucidate subpopulations who derived benefit from VEKLURY® treatment. Consequently, according to the applicant, it is unclear what conclusive findings can be drawn from the study results at this time.

The applicant stated that according to a perspective piece by Rubin, et al., the FDA approval for VEKLURY® was based on robust evidence from three pivotal studies, including the randomized, double-blind, placebo-controlled ACTT–1 study. The applicant stated that in the opinion of Rubin, et al., the results of SOLIDARITY were not inconsistent with the results of ACTT–1 and any apparent inconsistencies arose from differences in the designs and purposes of the studies. The applicant asserted that the authors of the perspective piece stated that the effect of VEKLURY® appears to be on the course of hospitalization rather than on mortality.[819]

According to the applicant, an editorial by Harrington, et al. indicated that the authors consider it likely that the estimated treatment effects on mortality that were observed in SOLIDARITY are largely accurate given the size of the SOLIDARITY study; however, aspects of the study design that allowed for the rapid execution of the study undermine the ability of the

study to evaluate more subtle endpoints, such as time to recovery.[820]

The applicant noted that treatment guidelines from the US National Institute of Health and the Infectious Disease Society of America, which have been updated since publication of the interim data from the SOLIDARITY study, continue to recommend treatment with VEKLURY® in hospitalized patients who require supplemental oxygen. Further, the applicant asserted, these efficacy and safety data have supported regulatory approvals or temporary authorizations to treat COVID–19 in approximately 50 countries worldwide.

Third, the applicant was asked to provide more information on the evidence showing there was a trend towards lower mortality, notably in patients who received low flow oxygen. The applicant stated that in the overall ACTT–1 population, there was a numerical trend toward lower mortality in the VEKLURY® group (11.4%) compared to the placebo group (15.2%), which did not reach statistical significance (p=0.07).[821] The applicant asserted that a post-hoc analysis of participants receiving low-flow supplemental oxygen (baseline ordinal scale score of 5), revealed that VEKLURY® reduced mortality by 70% compared with placebo (4.0% vs. 12.7%; hazard ratio: 0.30 [95% CI: 0.14 to 0.64]).

Lastly, the applicant was asked to provide more information to justify the claim that all subgroups consistently improved with VEKLURY®, given that Medicare patients are older and frequently have co-morbidities. According to the applicant, across the clinical spectrum, hospitalized patients with COVID–19 receiving VEKLURY® recovered 5 days faster, on average, than those receiving placebo (10 days vs. 15 days; rate ratio: 1.29; 95% CI: 1.12–1.49; p<0.001), representing an increased recovery rate of 29%.[822] The applicant stated that this clinically meaningful benefit is observed across subgroups, including among participants at least 65 years of age.

Response: We appreciate the applicant's responses to questions asked at the New Technology Town Hall Meeting and will take this information into consideration when deciding whether to approve new technology add-on payments for VEKLURY®.

u. ZEPZELCA™ (lurbinectedin)

Jazz Pharmaceuticals submitted an application for new technology add-on payments for ZEPZELCA™ for FY 2022. According to the applicant, ZEPZELCA™ is an alkylating drug indicated for the treatment of adult patients with metastatic small cell lung cancer (SCLC) with disease progression on or after platinum-based chemotherapy. ZEPZELCA™ is a marine-derived, synthetic antineoplastic compound that inhibits transcription-dependent replication stress and genome instability in tumor cells.

According to the applicant, small cell lung cancer (SCLC) is an aggressive type of lung cancer where patients that progress after first-line chemotherapy have a poor prognosis due to limited clinical benefit from currently available second-line chemotherapy. Patients relapsing or progressing more than 90 days after completion of first-line treatment are considered platinum sensitive and may be rechallenged with platinum-based chemotherapy.[823] The majority of SCLC treated patients show disease relapse and are eligible for second-line therapy; however, few second-line treatment options exist.[824]

According to the applicant, lung cancer overall is the second most common malignancy in the United States with 234,030 new cases and 154,050 deaths estimated in 2018.[825] Per the applicant, where most lung cancers are classified as non-SCLC, SCLC now comprises approximately 15% of all lung cancers. According to the applicant, SCLC is the most aggressive form of lung cancer characterized by rapid disease progression and early metastatic spread [826] [827] [828]—doubling in cell number about every 30 days and spreading quickly to lymph nodes and other organs.[829] The applicant stated that the Veterans Lung Cancer Study Group used a two-stage system for describing SCLC, with a limited-stage (30% of cases) which is confined to a smaller portion of the body, and an extensive-stage (70% of cases) where the tumor was widespread.[830] [831] Many patients with SCLC have substantial comorbidities that may affect performance status and treatment options.[832] A restrospective review analysis of Extensive-stage SCLC (ES–SCLC) patients found that when compared to patients at diagnosis, patients receiving second-line therapy were more likely to have congestive heart failure (67% vs 49%), thromboembolism (9% vs 2%), and depression (11% vs 7%).[833] Further, these patients receiving second-line therapy were more likely to have infectious disease (57% vs 43%), electrolyte disorders (50% vs 22%), anemia (45% vs 19%), neutropenia (17% vs <0.2%), thrombocytopenia (12% vs 2%), and diarrhea (7% vs 3%) compared to the incidence of these comorbidities at diagnosis of ES–SCLC.[834]

According to the applicant, the standard of care for first-line chemotherapy for both limited-stage SCLC and ES–SCLC is platinum doublet and, in the case of ES–SCLC, platinum doublet in combination with a checkpoint inhibitor. SCLC is sensitive to platinum-based chemotherapy in the first-line setting but almost universally relapses, requiring subsequent lines of therapy.[835] [836] [837] Once a patient

Continued

relapses, the likelihood of response is highly dependent on time from initial therapy to relapse,[838] with survival based on the duration of remission.[839] According to the applicant, ES–SCLC is incurable; patients are treated with palliative intent, with a median survival of 7 to 11 months after diagnosis and with less than 5% survival at 2 years.[840] [841] Even limited-stage disease is rarely cured with radical local therapy (surgery or radiotherapy), and systemic chemotherapy (platinum plus etoposide) remains the cornerstone of first-line treatment in SCLC.[842] Despite best management, the 5-year overall survival (OS) of even limited-stage SCLC is still only 15% to 25%.[843] [844]

The applicant asserted that while SCLC shows high sensitivity to first-line chemotherapy and radiotherapy, most patients develop disease relapse or progression within one year of treatment.[845] [846] [847] It is reported that about 80% of limited-disease SCLC patients and almost all patients with ES–SCLC will develop relapse or progression after first-line treatment. Without second-line chemotherapy, the median survival time is 2 to 4 months.[848] [849] The applicant stated that for patients classified as sensitive to first line treatment, due to remaining relapse-free for at least 3 months after treatment, rechallenge with the same chemotherapy regimen given as first line treatment is reasonable. For those classified as refractory (disease progression through first line treatment) and resistant (patients who show initial response to treatment but whose disease progresses within 3 months of completing chemotherapy), the second line treatment is Hycamtin (topotecan). According to the applicant, topotecan was the only preferred agent in the National Comprehensive Cancer Network (NCCN) Clinical Practice Guidelines for second-line treatment of patients with a Chemotherapy-free Interval (CTFI) <6 months. In summarizing the evidence of topotecan efficacy, the applicant stated that studies showed a median survival of 6.8 to 7.8 months,[850] [851] [852] progression free survival of 2.7 to 3.5 months,[853] [854] [855] and a median time to progression of 13.3 weeks.[856] Furthermore, the applicant asserted that topotecan is associated with hematological toxicities such as anemia, neutropenia, thrombocytopenia, and febrile neutropenia.[857] [858] [859]

The applicant stated that since topotecan's approval in 1998, no other second-line SCLC treatment option had been approved until ZEPZELCA™ gained approval in June 2020. According to the applicant, ZEPZELCA™ is the first second-line treatment option for SCLC since 1998.

According to the applicant, the FDA approved ZEPZELCA™ on June 15, 2020 under the FDA's Accelerated Approval Program with Priority Review. ZEPZELCA™ was also granted Orphan Drug Designation by the FDA. ZEPZELCA™ is administered intravenously as a 3.2 mg/m^2 dose over one hour, repeated every 21 days until disease progression or unacceptable toxicity. ZEPZELCA™ will typically be administered in an outpatient clinic. However, per the applicant, because many patients with SCLC have substantial comorbidities that may necessitate hospitalization and initiation of treatment, the first infusion and possibly some additional infusions will be administered in the inpatient

hospital setting.[860] The applicant stated that there are no existing ICD–10–PCS codes that uniquely identify the administration of ZEPZELCA™. The applicant submitted a request for a unique ICD–10–PCS code to identify the technology beginning FY 2022.

As previously discussed, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and, therefore, would not be considered ''new'' for purposes of new technology add-on payments.

With respect to the first criterion, whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome, the applicant asserted that the mechanism of action of ZEPZELCA™ is not the same or similar to the mechanism of action of currently available products used in the treatment of patients with metastatic SCLC with disease progression on or after platinum-based chemotherapy. Per the applicant, ZEPZELCA™ is a novel synthetic antineoplastic marine derived compound with a unique mode of action and chemical structure, with a terminal half-life of 51 hours and total plasma clearance of 11 L/h (50%).[861] [862] According to the applicant, ZEPZELCA™ is a transcription inhibitor that binds DNA preferentially in quinine-rich sequences located within gene regulatory elements and induces a rapid degradation of transcribing RNA polymerase II that induces the eviction of oncogenic transcription factors and the silencing of their transcription program. The applicant states that ZEPZELCA™ has preclinical data which suggests that oncogenic transcription of DNA to RNA was selectively inhibited via the dual actions of RNA polymerase II degradation and the formation of DNA breaks, which leads to apoptosis.[863] The applicant further states that ZEPZELCA™ has been shown to induce immunogenic cell death,[864] and based on preclinical data, impacts the tumor microenvironment by altering the survival of tumor-associated macrophages (TAMs) and the production and function of key oncogenic inflammatory and growth factors.[865]

According to the applicant, topotecan is a semi-synthetic derivative of camptothecin with topoisomerase I-inhibitory activity that relieves torsional strain in DNA by inducing reversible single strand breaks. The pharmacokinetics of topotecan have been evaluated in cancer patients following doses of 0.5 to 1.5 mg/m^2 administered as a 30-minute infusion. Topotecan exhibits multiexponential pharmacokinetics with a terminal half-life of 2 to 3 hours. Total exposure area under the curve (AUC) is approximately dose proportional.[866] The applicant asserts that a clinical differentiator of ZEPZELCA™ from topotecan is the rate of hematologic adverse reactions including neutropenia, anemia, thrombocytopenia, and febrile neutropenia.[867] [868] [869]

Lastly, the applicant asserted that ZEPZELCA™ is not substantially similar to the more recently approved first-line treatments for ES–SCLC, TECENTRIQ® (atezolizumab) and IMFINZI® (durvalumab), both of which are PD–L1 blocking antibodies.

With respect to the second criterion, whether a product is assigned to the same or a different MS–DRG, the applicant stated that ZEPZELCA™ will not map to MS–DRGs distinct from other treatments for SCLC.

With respect to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population when compared to an existing technology, the applicant stated that there have been no approved treatments for second-line treatment of SCLC since 1998 when topotecan was approved. Topotecan is indicated for the treatment of small cell lung cancers in patients with chemotherapy-sensitive disease after failure of first-line chemotherapy.[870] The applicant states that topotecan is approved for relapses at least 60 days after initiation of a platinum-containing first-line regimen. ZEPZELCA™ is indicated for the treatment of adult patients with metastatic small cell lung cancer (SCLC) with disease progression on or after platinum-based chemotherapy.[871] The applicant also stated that ZEPZELCA was listed as a preferred regimen by the NCCN Clinical Practice Guidelines for second-line treatment of patients with a chemotherapy free interval (CTFI) ≤6 months and recommended for patients with a CTFI >6 months.[872]

The applicant repeated results concerning the efficacy of topotecan and asserted that the efficacy results were achieved with a high rate of grade three and four hematologic Treatment Emergent Adverse Events (TEAEs).

In summary, the applicant asserted that ZEPZELCA™ meets the newness criterion because its mechanism of action is not the same or similar to the mechanism of action of currently available products used in the treatment of adult patients with metastatic SCLC and because it is indicated in patients with disease progression on or after platinum-based chemotherapy.

We are inviting public comments on whether ZEPZELCA™ is substantially similar to an existing technology and whether it meets the newness criterion.

With respect to the cost criterion, the applicant conducted the following analysis to demonstrate that ZEPZELCA™ meets the cost criterion. For the primary cost analysis cohort the applicant used the selection criteria of the presence of a lung cancer code as defined by ICD–10–CM family C34 (Malignant neoplasm of bronchus and lung) as the principal diagnosis and the presence of any chemotherapy code as

defined by ICD_10–CM Z51.11 (Encounter for antineoplastic chemotherapy), ICD–10–CM Z51.12 (Encounter for antineoplastic immunotherapy), or any ICD–10–PCS chemotherapy code. Additionally, the applicant performed three sensitivity analyses for the cost criterion. The first is a broad cohort with the selection criteria of the presence of at least one lung cancer code (C34xx) and the presence of any chemotherapy code as defined by ICD–10–CM code Z51.11 (Encounter for antineoplastic chemotherapy), Z51.12 (Encounter for antineoplastic immunotherapy), or any ICD–10PCS chemotherapy code. The second and third analyses involved TECENTRIQ® and IMFINZI® which are both immunotherapy drugs that have FDA approval for use as part of the first-line treatment in patients with SCLC. These drugs are to be used along with chemotherapy. The second analysis is the ''TECENTRIQ®'' cohort with the selection criteria of the presence of at least one lung cancer code (C34xx) as either the principal or admitting diagnosis, and excluding cases with any ES–SCLC surgical codes. The final analysis, the ''IMFINZI®'' cohort, has the selection criteria of at least one of the following: (1) Presence of at least one lung cancer code (C34xx) and presence of any platinum-based chemotherapy code as defined by ICD–10–CM Z51.11 (Encounter for antineoplastic chemotherapy) or Z51.12 (Encounter for antineoplastic immunotherapy); (2) Presence of at least one lung cancer code (C34xx) and assigned to MS–DRGs for respiratory neoplasms (180–182). The applicant stated that ZEPZELCA™ is supplied in 4 mg single-dose vials with the recommended dose of 3.2 mg/m² by intravenous infusion over 60 minutes every 21 days until disease progression or unacceptable toxicity. Based on clinical study, the applicant stated that a single dose of ZEPZELCA™ ranged from 4.05 mg to 6.4 mg. To identify cases that may be eligible for the use of ZEPZELCA™, the applicant searched the FY 2019 MedPAR LDS file using these cohort selection criteria. The applicant stated that in all analyses, they imputed a case count of 11 for MS–DRGs with fewer than 11 cases and calculated the weighted average standardized charges across all MS–DRGs.

Based on the FY 2019 MedPAR LDS file, the applicant identified a total of 1,100 cases in the primary cohort (mapped to 17 MS–DRGs), 4,034 cases in the first sensitivity cohort (mapped to 195 MS–DRGs), 34,437 cases in the second sensitivity cohort (mapped to 253 MS–DRGs), and 24,209 cases in the third sensitivity cohort (mapped to 128 MS–DRGs). The applicant utilized the FY 2019 Final Rule with Correction Notice IPPS Impact File. Using the cases identified, the applicant then calculated the unstandardized average charges per case for each MS–DRG. The applicant expects that ES–SCLC patients will receive their initial dose of ZEPZELCA™ in the inpatient setting. The applicant then standardized the charges and inflated the charges by 1.13218 or 13.2 percent, the same inflation factor used by CMS to update the outlier threshold in the FY 2021 IPPS/LTCH PPS final rule. The applicant removed charges associated with chemotherapy since treatment with ZEPZELCA™ would replace chemotherapy. To do so the applicant found the ratio of chemotherapy charges to radiology charges (0.14470075) from claims in the FY 2019 inpatient standard analytic file with a primary diagnosis of lung cancer (ICD–10–CM C34xx) and chemotherapy charges greater than zero. The applicant then added the charges for ZEPZELCA™ by converting the costs of a single treatment (two single-dose vials) to a charge by dividing the cost by the national average cost-to-charge ratio of 0.187 for pharmacy from the FY 2021 IPPS/LTCH PPS final rule. The applicant calculated a final inflated average case weighted standardized charge per case for the primary cohort as $206,030, and $182,895, $146,174, and $130,975 for sensitivity cohorts 1, 2 and 3, respectively. The applicant referred to the FY 2022 New Technology Thresholds data file to determine the average case-weighted threshold amount for the primary cohort as $79,420, and $70,499, $70,226, and $57,383 for sensitivity cohorts 1, 2 and 3, respectively. The final inflated average case-weighted standardized charge per case in the primary cohort and three sensitivity cohorts exceeded the average case-weighted threshold amount by $126,610, $112,396, $75,948, and $73,592 respectively. Because the final inflated average case-weighted standardized charge per case exceeds in all scenarios the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion.

While we would not expect a significant difference, we note that instead of referring to the correction notice tab within the FY 2022 New Technology Thresholds data file, the applicant referred to the final rule tab. The FY 2022 New Technology Thresholds data file is available on the CMS IPPS home page at: *https://www.cms.gov/medicare/acute-inpatient-pps/fy-2021-ipps-final-rule-home-page#Data*.

We also note that the analysis provided by the applicant includes many MS–DRGs that are defined by factors that may or may not be related to ZEPZELCA™'s indication for metastatic SCLC. For example, it is not clear that MS–DRG 004 Trach w MV >96 Hrs or Pdx Exc Face, Mouth & Neck w/o Maj O.R has a direct connection to small cell lung cancer though it may be related.

We are inviting public comment on whether ZEPZELCA™ meets the cost criterion.

With respect to the substantial clinical improvement criterion, the applicant asserted that ZEPZELCA™ significantly improves clinical outcomes over existing treatment options for adult patients with metastatic SCLC with disease progression on or after platinum-based chemotherapy in five ways. First, ZEPZELCA™ offers an improved treatment option from both a safety and efficacy standpoint. Second, ZEPZELCA™ offers safety improvement for treatment of patients with metastatic SCLC with disease progression on or after platinum-based chemotherapy over safety results previously reported in the literature for a comparable patient population. Third, patients with metastatic SCLC whose disease progresses on or after platinum-based chemotherapy achieved higher overall response rates (ORRs) following treatment with ZEPZELCA™ than ORR that had been previously reported in the literature for a comparable patient population. Fourth, overall survival (OS) rates achieved with ZEPZELCA™ are clinically meaningful and are the highest rates reported for patients with metastatic SCLC whose disease progresses on or after platinum-based chemotherapy in more than 2 decades. Fifth, the applicant asserted that ZEPZELCA™ may represent a valuable treatment alternative to platinum rechallenge. The applicant submitted (or in some cases, referred to) multiple sources in support of these claims including retrospective analyses and other studies, a meta-analysis, data abstracts, literature reviews, prescribing information, FDA approved cancer therapies, practice guidelines, workgroup deliberations, a commentary, and an opinion regarding survival outcomes.

With regard to the first claim, the applicant stated that ZEPZELCA™ is the first second-line treatment option approved for SCLC since 1998 and is

indicated for the treatment of adult patients with metastatic SCLC with disease progression on or after platinum-based chemotherapy, a patient population with dismal outcomes. The applicant also stated that ZEPZELCA™ offers an improved treatment option from both a safety and efficacy standpoint. The applicant outlined the nature of small cell lung cancer, patient treatment and prognosis. The applicant also stated that ZEPZELCA™ could represent a valuable option for a patient population with high unmet medical need.[873] Specifically, the applicant referred to four analyses, an epidemiology review, prescribing information, practice guidelines, a literature review inclusive of four articles, and one ZEPZELCA™ study.

First, an analysis stated that although small cell lung cancer shows high sensitivity to first-line chemotherapy and radiotherapy, most patients develop disease relapse or progression.[874] Another analysis stated that most patients experience relapse of small cell lung cancer within 1 year of treatment.[875] A separate analysis indicated that most patients who have initially responded to chemotherapy and radiotherapy eventually experience recurrence of the cancer in a few months.[876] The fourth analysis indicated that almost all patients with extended disease will develop disease relapse or progression after first-line treatment and that without second-line chemotherapy, the median survival time is 2 to 4 months.[877]

Next, in referring to the epidemiology review, the applicant stated that most cases of small cell lung cancer occur in individuals aged 60–80.[878] In referring to prescribing information, the applicant stated that in 1998, Hycamtin (topotecan) was approved for patients with SCLC sensitive disease after failure of first-line chemotherapy. The applicant further stated that in the topotecan Phase 3 clinical study, sensitive disease was defined as disease responding to chemotherapy, but subsequently progressing at least 60 days after chemotherapy.[879]

Next, in referring to practice guidelines, the applicant stated that ZEPZELCA was studied in a broader (resistant disease and sensitive disease) population of SCLC patients and that prespecified subgroup analyses of ZEPZELCA results were done for patients with SCLC by CTFI in patients with resistant disease (CTFI <90 days) and sensitive disease (CTFI interval ≥90 days). The applicant further noted that NCCN guidelines list ZEPZELCA as a preferred regimen for second-line treatment of patients with a CTFI ≤6 months and recommended ZEPZELCA for patients with a CTFI >6 months.[880]

Next, the applicant referred to a literature review and submitted four sources. First, per the applicant, Iams et. al. describes available data on clinical efficacy, the emerging evidence regarding biomarkers and ongoing clinical trials using immune checkpoint inhibitors and other immunotherapies in patients with SCLC. The article included a discussion of the significant unmet needs in second-line therapy for SCLC.[881] Second, per the applicant, Tsiouprou et. al. reported on a literature review of immunotherapy in treatment of ES–SCLC and included a discussion of the significant unmet needs in second-line therapy for SCLC.[882] Third, per the applicant, Wang et. al. presented a review of SCLC development, current therapy and included a discussion of the significant unmet needs in second-line therapy for SCLC.[883] Fourth, per the applicant, Taniguchi et. al., is an opinion article discussing recent developments in the treatment of SCLC and includes a discussion of the significant unmet needs in second-line therapy for SCLC.[884]

Finally, the applicant referred to Trigo, et. al., and stated that authors expressed that ZEPZELCA could present a valuable potential new treatment option after first-line platinum based chemotherapy.[885]

With regard to the second claim, the applicant asserted that ZEPZELCA™ offers safety improvement for treatment of patients with metastatic SCLC with disease progression on or after platinum-based chemotherapy over safety results previously reported in the literature for a comparable patient population. The applicant asserted that safety is of particular importance for patients ≥65 with age being a major patient-related risk factor.[886] The applicant also referred to a meeting abstract stating that several acute comorbidities were more common in Medicare patients initiating second-line chemotherapy than in all patients at diagnosis: Infectious disease (57% versus 43%), electrolyte disorder (50% versus 22%), anemia (45% versus 19%), neutropenia (17% versus 0.1%), thrombocytopenia (12% versus 2%), and diarrhea (7% versus 3%).[887]

The applicant also referred to six studies to support this claim. First, the applicant submitted Trigo et. al., that was based on Study B–005 (NCT01454972), a single-arm, open label, phase II basket trial to evaluate the activity and safety of lurbinectedin in patients with SCLC after failure of platinum-based chemotherapy. One hundred five patients with a diagnosis of SCLC and pre-treated with only one previous chemotherapy-containing line of treatment were included. Treatment consisted of 3.2mg/m2 lurbinectedin intravenously every 3 weeks until disease progression or unacceptable toxicity. The safety-related outcomes demonstrated the following adverse events: Anemia 9%, leucopenia 29%, neutropenia 46%, and thrombocytopenia 7%. Serious treatment-related adverse events occurred in 10% of patients, of which

neutropenia and febrile neutropenia were the most common with 5% of patients for each.[888]

Second, the applicant submitted an article from Von Pawel, et. al., of a randomized phase 3 study of a total of 637 patients with refractory or sensitive SCLC treated with topotecan and reported hematologic toxicities of grade ≥3 anemia, 30.5%; neutropenia, 53.8%; thrombocytopenia, 54.3%; febrile neutropenia, 3%.[889]

Third, the applicant submitted an open label phase 2 study of 179 patients with SCLC who relapsed after initial platinum-based chemotherapy, treated with topotecan and reported hematologic toxicities of neutropenia, 78.4%; thrombocytopenia, 45.5%; and febrile neutropenia/neutropenic infection/neutropenic sepsis, 18%.[890]

Fourth, the applicant submitted an abstract from Monnet, et. al. of an open-label, multicenter, phase 3 trial that randomized patients with SCLC that responded to first-line platin-etoposide doublet treatment but showed evidence of disease relapse or progression at least 90 days after completion of the first-line treatment. Eighty-two patients were assigned to each treatment group: Those receiving combination chemotherapy (carboplatin and etoposide) versus those receiving oral topotecan. The abstract indicated that grade ¾ neutropenia was significantly more common in the topotecan group at 35.8% versus 19.7%; insignificantly more febrile neutropenia in the topotecan arm at 13.6% versus 6.2%; no difference for grade ¾ thrombocytopenia, 35.8% versus 30.9%; and anemia, 24.6% versus 21%.[891]

Fifth, the applicant submitted an abstract from Leary, et. al., that is described as a pooled safety analysis with data from the phase II, single arm basket study by Trigo, et. al. (discussed previously), and a phase III RCT, the CORAIL study. The pooled analysis included a total of 554 patients treated with lurbinectedin. Of the 554, 335 were from the phase II basket study with selected solid tumors (9 indications including 105 patients with small cell lung cancer) and 219 were from the phase III CORAIL study with platinum resistant ovarian cancer. Authors presented an indirect exploratory comparison (pooled data from CORAIL + basket) and a direct comparison (data from CORAIL) of lurbinectedin vs. topotecan. Authors reported adverse events with lurbinectedin were grade ½ fatigue, nausea and vomiting. Treatment-related lurbinectedin/topotecan outcomes showed: Dose reductions: 22.9/48.3%; delays: 25.8/52.9%; grade ≥3 serious adverse events: 15.0/32.2%; discontinuations: 3.2/5.7%; deaths: 1.3/1.5%; granulocyte colony stimulating factor (G–CSF) use: 23.8/70.1%; and transfusions: 15.9/52.9%. Authors concluded by stating that a significant safety advantage was observed when lurbinectedin was compared with topotecan in the CORAIL trial in terms of hematological toxicities. Authors also noted that with the limitations of indirect comparisons, in the pooled safety analysis, fewer lurbinectedin-treated patients had severe hematological toxicities, severe adverse events, dose adjustments, treatment discontinuations and use of supportive treatments than topotecan-treated patients.[892]

Sixth, the applicant provided a presentation summarizing results from the randomized phase 3 CORAIL study. The patient population was comprised of platinum resistant ovarian, fallopian or primary peritoneal cancer. Enrolled patients were randomly assigned to receive lurbinectedin or investigator choice of pegylated liposomal doxorubicin (PLD) or topotecan. The applicant stated that ZEPZELCA™ was better tolerated than the control arm and that, overall, the data support a favorable safety profile for ZEPZELCA™.[893]

With regard to the third claim, the applicant stated that patients with metastatic SCLC whose disease progresses on or after platinum-based chemotherapy achieved higher ORRs following treatment with ZEPZELCA™ than ORR that had been previously reported in the literature for a comparable patient population. The applicant referred to four primary resources in support of ZEPZELCA™. First, as described previously, the applicant submitted Trigo, et. al., in which the primary endpoint is described as lurbinectedin anti-tumor activity in terms of investigator-assessed overall response (OR) and duration of response (DOR) as a secondary endpoint.[894] The OR rate was identified as 35.2% and the mean DOR as 5.3 months. Second, the applicant submitted an abstract from Subbiah, et. al., a sub-study from Study B–005, that concluded that time from randomization to response was similar regardless of prior resistance or sensitivity to platinum-based chemotherapy, and clinically meaningful DOR was noted in both subgroups of responders.[895] Third, the applicant submitted an abstract from a second sub-study from Study B–005, indicating that ORR was similar across baseline characteristics: Age <65 = 36.8%; age ≥65 = 32.4%; female = 31%; male = 38.1%; 1 prior line of therapy = 34.7%; ≥2 prior lines of therapy = 42.9%; BSA ≤1.8m2 = 34.5%; and BSA >1.8m2 = 36%. The authors concluded by noting that response to lurbinectedin appeared consistent regardless of baseline patient characteristics.[896] Fourth, the applicant submitted a commentary from Arrieta, et. al., and stated that ZEPZELCA™ outperformed all previously reported results for topotecan.[897]

The applicant also referred to three additional sources reflecting ORRs following treatment with topotecan. The Phase 3 trial of a total of 637 patients with refractory or sensitive SCLC treated with topotecan demonstrated an ORR of 16.9% and DOR of 4.2 months.[898] In the open-label, multicenter, phase 3 trial of 164 patients with sensitive relapsed SCLC that responded to first-line platin etoposide doublet treatment but showed evidence of disease relapse or progression at least 90 days after

completion of the first-line treatment, patients randomized to the topotecan group demonstrated an ORR of 25%.[899] Lastly, a randomized, multi-center phase 3 trial of 107 patients treated with topotecan reported an ORR of 24.3%.[900]

With regard to the fourth claim, the applicant stated that the OS rates achieved with ZEPZELCA™ are clinically meaningful and are the highest rates reported for patients with metastatic SCLC whose disease progresses on or after platinum-based chemotherapy in more than 2 decades. The applicant submitted two studies in support of its claim of improved survival rates in patients treated with ZEPZELCA™. First, as described previously, the applicant submitted Trigo, et. al. and highlighted secondary endpoints including progression-free survival, progression-free survival at 4 and 6 months, overall survival and overall survival at 6 and 12 months. The mean progression free survival was identified as 3.5 months, mean overall survival 9.3 months in the overall population, 11.9 months in patients with a CTFI ≥90 days and 5.0 months in those with CTFI <90 days.[901]

Second, the applicant submitted an abstract from Subbiah, et. al., that summarized a sub-study from Study B–005 in which overall survival was a secondary endpoint. Authors report that patients treated with lurbinectedin had CTFI ≥180 days and form the basis for their analysis. Sixty percent of patients were male, had ECOG PS 0–1, and had a median age of 57 years. Extensive stage disease at initial diagnosis was present in 35% of patients. All 20 patients had received prior platinum/etoposide, with no prior immunotherapy. Authors also reported that with a censoring of 55.0%, the median overall survival was 16.2 months. Per the abstract, eleven patients (55.0%) were censored for survival analysis: Eight were on follow-up after disease progression, two were ongoing lurbinectedin treatment, and one had treatment discontinuation because of a treatment-related adverse event (worsening of prior peripheral neuropathy). Median follow-up was 15.6 months. Authors concluded time from randomization to response was similar regardless of prior resistance or sensitivity to platinum-based chemotherapy.[902]

The applicant also referred to several randomized phase I and II studies of patients undergoing alternate therapies and highlighted those OS rates. The applicant provided an abstract from Monnet, et. al., (as mentioned previously with respect to applicant's second and third claims) summarizing results from a study that investigated whether the doublet carboplatin-etoposide was superior to topotecan monotherapy as second-line treatment in patients with sensitive relapsed SCLC. Authors reported patients treated with topotecan had progression free survival (PFS) of 2.7 months and OS of 7.4 months.[903] The applicant also referred to Evans, et. al., summarizing results from a study of patients with SCLC who relapsed after initial platinum-based chemotherapy who were divided into subgroups, chemosensitive vs. chemo-resistant/refractory disease. Patients were treated with topotecan. Authors reported topotecan PFS of 3.0 months and OS of 6.8 months.[904] The applicant referred to Von Pawel, et. al., summarizing the results of a phase 3 trial of a total of 637 patients with refractory or sensitive SCLC, including topotecan PFS of 3.5 months and OS of 7.8 months (5.7 months for refractory).[905] Lastly, the applicant referred to Von Pawel, et. al., that reported randomized, multi-center phase 3 results for topotecan with time to progression of 13.3 weeks and median OS of 25 weeks.[906]

The applicant explained that a statement from an American Society of Clinical Oncology (ASCO) workgroup indicated that relative improvements in median OS of at least 20% are necessary to define a clinically meaningful improvement in outcome.[907] The applicant summarized oncology literature reviews between 2014 and 2016 asserting that ASCO's threshold for OS was met in only 12% of studies (6 of 49) and 19% of therapies.[908] [909]

The applicant further stated that ZEPZELCA™'s median OS for the overall population compared to the literature, meets the ASCO threshold and, for subsets of patient groups, median OS exceeds the ASCO threshold for clinically meaningful.

The applicant concluded by stating that there is an urgent need for new treatment options for the SCLC population.[910] The applicant asserted that CMS's new technology add-on payment approval of TECENTRIQ® for the treatment of patients with ES–SCLC effective for FY 2021 (85 FR 58684) further supports the urgency, referring to its 2 month improvement in survival.

The applicant also referred to comments from specialists in the field of lung cancer stating that despite small trial sizes, improvement in overall survival is a major achievement and that any advance in survival is important given that few patients diagnosed with SCLC survive for even a year despite treatment.[911]

With regard to the fifth claim, that ZEPZELCA™ may represent a valuable treatment alternative to platinum rechallenge, the applicant submitted several sources pertaining to ZEPZELCA™. First, the applicant submitted two sub-analyses from Subbiah, et. al., that were based on Study B–005 as its primary support for ZEPZELCA™. In both of these sub-analyses, patients had been pre-treated with one prior platinum-containing line. The first analysis included 20 patients from a subset of patients with CTFI >180 and authors report that patients

[911] NCI Staff. For small cell lung cancer, immunotherapy drug finally brings improved survival. National Cancer Institute. October 3, 2018. *https://www.cancer.gov/news-events/cancer-currents-blog/2018/small-cell-lung-cancer-atezolizumab-survival.*

treated with lurbinectedin had an ORR at 60.0% and a median DoR of 5.5 months. The second analysis included 60 patients from a SCLC cohort of the basket trial, with CTFI >90 d (20 pts with CTFI >180 d). The applicant states that ZEPZELCA™ was shown to be effective and well-tolerated in the platinum-sensitive relapsed SCLC population especially when CTFI >180 days. From these results, the authors concluded that ZEPZELCA™ may represent a valuable alternative to platinum rechallenge.[912] [913] The applicant also referenced Arrieta et. al., stating that ZEPZELCA™ data outperformed less established treatment schemes including platinum rechallenge.[914] The applicant stated that the July 7, 2020 NCCN Clinical Practice Guidelines in Oncology indicate that lurbinectedin is identified as a Preferred Regimen in relapse ≤6 months and a Recommended Regimen in relapse >6 months.[915] The applicant referred to the authors' conclusion in Genestreti et. al., stating that the outcome for second line chemotherapy for SCLC is poor and that rechallenge platinum/etoposide is a reasonable option with potentially better outcomes than standard chemotherapy.[916]

Finally, the applicant referred to Monnet, et. al., stating that patients treated with combination therapy, carboplatin and etoposide, achieved a median OS of 7.4 months and ORR of 49%.[917]

After review of the information provided by the applicant, we have the following concerns. The evidence submitted by the applicant in support of ZEPZELCA™'s improvement in overall response and survival rates is based on one single-arm, open label, phase II basket study (Study B–005 (NCT01454972)) and several smaller subsetted analyses that were based on the basket study, and we note that without a direct comparison arm it may be more difficult to draw definitive conclusions.[918] [919] [920] [921] We note the following differences between the historical control patients and patients treated with ZEPZELCA™ in these studies, which may confound the comparisons: First, patients with central nervous system involvement (brain metastases) were excluded from ZEPZELCA™ treatment, and we note that Arrieta, et. al., noted that this criterion is of particular interest when translating results to the clinical setting, since patients with SCLC are known to be prone to develop brain metastases, and up to 50% do so throughout the disease course.[922] Second, patients treated with ZEPZELCA™ had access to immunotherapy during first line treatment, which may support patients' immune systems in fighting cancer. Third, the CTFI used in the single arm basket trial differs from those used in the historical controls of topotecan studies, and we note that CTFIs can impact treatment response and outcome. As, per the applicant, ZEPZELCA™ was listed as a preferred regimen by the NCCN Clinical Practice Guidelines for second-line treatment of patients with a CTFI ≤6 months and recommended for patients with a CTFI >6 months, while topotecan is only FDA approved for chemotherapy-sensitive cases, defined using a 60 day CTFI, we note that the appropriate comparator treatment for ZEPZELCA™ would differ depending on the CTFI subset. However, the historical controls relied on an overall topotecan population with CTFI >60. To the extent that this group was more heavily weighted with patients in the lower CTFI group, it is unclear whether this may partially explain the poorer outcomes of patients in the historical control groups. We also note that, while the claim of improved hematological outcomes using ZEPZELCA™ appears to be mostly supported by the female-only arm of the CORAIL study, results from the pooled sample of the basket trial still appeared to demonstrate an improvement over the topotecan arm. We believe that this may suggest that the inclusion of male patients did not alter the conclusion that patients treated with ZEPZELCA™ appeared more favorable than those treated with topotecan. We further note that bone marrow stimulating drugs were allowed in the topotecan arm of the CORAIL study so the observed adverse hematologic effects may have been the best case for that arm of the study. Finally, we note that the subsetted analyses generated from the primary basket study have small sample sizes and the authors of these studies stated that further research on larger populations is required to draw firm conclusions.[923] [924]

We invite public comments on whether ZEPZELCA™ meets the substantial clinical improvement criterion.

We did not receive any written comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for ZEPZELCA™.

6. Proposed FY 2022 Applications for New Technology Add-On Payments (Alternative Pathways)

As discussed previously, beginning with applications for FY 2021, a medical device that is part of FDA's Breakthrough Devices Program and has received marketing authorization for the indication covered by the Breakthrough Device designation may qualify for the new technology add-on payment under an alternative pathway. Additionally, beginning with FY 2021, a medical product that is designated by the FDA as a Qualified Infectious Disease Product (QIDP) and has received marketing authorization for the indication covered by the QIDP

[923] Subbiah V, et al. Activity in second-line SCLC patient candidates for platinum rechallenge. ESMO (European Society for Medical Oncology) 2020 Congress; September 19–21, 2020. Poster 1784P

[924] Sands J, et al. Phase 2 basket trial of lurbinectedin in small-cell lung cancer (SCLC): Analysis of efficacy by baseline characteristics. IASLC 2020 North American Conference on Lung Cancer. Accepted for presentation October 16–17, 2020.

designation, and, beginning with FY 2022, a medical product that is a new medical product approved under FDA's Limited Population Pathway for Antibacterial and Antifungal Drugs (LPAD) and used for the indication approved under the LPAD pathway, may also qualify for the new technology add-on payment under an alternative pathway. Under an alternative pathway, a technology will be considered new and not substantially similar to an existing technology for purposes of the new technology add-on payment under the IPPS and will not need to meet the requirement that it represents an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. These technologies must still meet the cost criterion.

We note, section 1886(d)(5)(K)(ii)(II) of the Act provides for the collection of data with respect to the costs of a new medical service or technology described in subclause (I) for a period of not less than 2 years and not more than 3 years beginning on the date on which an inpatient hospital code is issued with respect to the service or technology. Our regulations in § 412.87(c)(2) for breakthrough devices and § 412.87(d)(2) for certain antimicrobial products state that a medical device/product that meets the condition in paragraph (c)(1) or (d)(1) of § 412.87 will be considered new for not less than 2 years and not more than 3 years after the point at which data begin to become available reflecting the inpatient hospital code (as defined in section 1886(d)(5)(K)(iii) of the Act) assigned to the new technology (depending on when a new code is assigned and data on the new technology become available for DRG recalibration). After CMS has recalibrated the DRGs, based on available data, to reflect the costs of an otherwise new medical technology, the medical technology will no longer be considered ''new'' under the criterion of this section.

We received 17 applications for new technology add-on payments for FY 2022 under the alternative new technology add-on payment pathway. One applicant withdrew its application prior to the issuance of this proposed rule. Of the remaining 16 applications, 13 of the technologies received a Breakthrough Device designation from FDA and three were designated as a QIDP by FDA. We did not receive any applications for technologies approved through the LPAD pathway.

In accordance with the regulations under § 412.87(e)(2), applicants for new technology add-on payments, including Breakthrough Devices, must have FDA marketing authorization by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. Under the policy finalized in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58742), we revised the regulations at § 412.87(e) by adding a new paragraph (3) which provides for conditional approval for a technology for which an application is submitted under the alternative pathway for certain antimicrobial products (QIDPs and LPADs) at § 412.87(d) that does not receive FDA marketing authorization by the July 1 deadline specified in § 412.87(e)(2), provided that the technology receives FDA marketing authorization by July 1 of the particular fiscal year for which the applicant applied for new technology add-on payments. We refer the reader to the FY 2021 IPPS/LTCH final rule for a complete discussion of this policy (85 FR 58737 through 58742).

As we did in the FY 2021 IPPS/LTCH PPS proposed rule, for applications under the alternative new technology add-on payment pathway, in this proposed rule we are making a proposal to approve or disapprove each of these 16 applications for FY 2022 new technology add-on payments. Therefore, in this section of the preamble of this proposed rule, we provide background information on each alternative pathway application and propose whether or not each technology would be eligible for the new technology add-on payment for FY 2022. We refer readers to section II.H.8. of the preamble of the FY 2020 IPPS/LTCH PPS final rule (84 FR 42292 through 42297) and FY 2021 IPPS/LTCH PPS final rule (85 FR 58715 through 58733) for a complete discussion of the alternative new technology add-on payment pathways for these technologies.

a. Alternative Pathway for Breakthrough Devices

(1) Aprevo™ Intervertebral Body Fusion Device

Carlsmed, Inc. submitted an application for new technology-add on payments for the aprevo™ Intervertebral Fusion Device (aprevo™) for FY 2022. Per the applicant, the device is an interbody fusion implant that stabilizes the lumbar spinal column and facilitates fusion during lumbar fusion procedures indicated for the treatment of spinal deformity. The applicant states that the implant device is custom made for patient-specific features, by using patient CT scans to create 3D virtual models of the deformity. The device is used during anterior lumbar interbody fusion, lateral lumbar interbody fusion, transforaminal lumbar interbody fusion, or standalone anterior lumbar interbody fusion procedures. According to the applicant, the aprevo™ device is additively manufactured and made from Titanium Alloy (Ti-6Al-4V) per ASTM F3001, and has a cavity intended for the packing of bone graft. In addition, the applicant explained that aprevo™ is used with supplemental fixation devices and bone graft packing. Per the applicant, the device was formerly known as ''Corra™.''

The aprevo™ device received FDA Breakthrough Device designation under the name ''Corra'' on July 1, 2020 for the Corra Anterior, Corra Transforaminal and Corra Lateral Lumbar Fusion System interbody device which is intended for use in anterior lumbar interbody fusion (ALIF), lateral lumbar interbody fusion (LLIF), and transforaminal lumbar interbody fusion (TLIF) under this designation. The applicant was granted FDA 510(k) clearance as a Class II medical device for the anterior lumbar interbody fusion and lateral lumbar interbody fusion indications on December 3, 2020. The applicant anticipates that the aprevo™ device will receive FDA marketing authorization by May 2021 for the additional indications of transforaminal interbody fusion and standalone anterior lumbar interbody fusion (which incorporates supplemental fixation). Since the anterior and lateral lumbar fusion indications that received marketing authorization on December 3, 2020 correspond to the indications that received Breakthrough Device designation, it appears that the newness date for these indications would be December 3, 2020. The transforaminal interbody fusion indication, which also corresponds to the indication that received Breakthrough Device designation, would have a different newness date, depending on when marketing authorization is received for that indication. We note that under the eligibility criteria for approval under the alternative pathway for certain transformative new devices, only the use of aprevo™ for the ALIF, LLIF, and TLIF indications, and the FDA Breakthrough Device designations it received for these uses, are relevant for purposes of the new technology add-on payment application for FY 2022.

According to the applicant, there are currently no unique ICD–10–PCS codes describing the device. The applicant submitted a request to the ICD–10 Coordination and Maintenance Committee for approval of a code for FY

2022 to uniquely identify the technology.

With respect to the cost criterion, the applicant provided the following analysis. The applicant used the MS–DRG grouping function within FindACode software in conjunction with the online MS–DRG v37.0 Definitions Manual to identify the appropriate MS–DRGs to which potential cases that may be eligible for treatment involving aprevo™ patient-specific interbody cages would most likely map. The applicant identified the following six relevant MS–DRGs:

MS-DRG	DESCRIPTOR
453	Combined Anterior/Posterior Spinal Fusion With Mcc
454	Combined Anterior/Posterior Spinal Fusion With Cc
455	Combined Anterior/Posterior Spinal Fusion Without Cc/Mcc
456	Spinal Fusion Except Cervical With Spinal Curvature Or Malignancy Or Infection Or Extensive Fusions With Mcc
457	Spinal Fusion Except Cervical With Spinal Curvature Or Malignancy Or Infection Or Extensive Fusions With Cc
458	Spinal Fusion Except Cervical With Spinal Curvature Or Malignancy Or Infection Or Extensive Fusions Without Cc/Mcc

The applicant conducted a review of ICD–10–PCS codes for procedures in which the aprevo™ patient-specific intervertebral body fusion cases might be placed into the lumbar spine of an adult patient diagnosed with spinal curvature. For MS–DRGs 453, 454, and 455, the applicant searched the FY 2019 MedPAR dataset for cases with any of the following procedure codes:

0SG00A0	Fusion of lumbar vertebral joint with interbody fusion device, anterior approach, anterior column, open approach
0SG00AJ	Fusion of lumbar vertebral joint with interbody fusion device, posterior approach, anterior column, open approach
0SG03A0	Fusion of lumbar vertebral joint with interbody fusion device, anterior approach, anterior column, percutaneous approach
0SG03AJ	Fusion of lumbar vertebral joint with interbody fusion device, posterior approach, anterior column, percutaneous approach
0SG04A0	Fusion of lumbar vertebral joint with interbody fusion device, anterior approach, anterior column, percutaneous endoscopic approach
0SG04AJ	Fusion of lumbar vertebral joint with interbody fusion device, posterior approach, anterior column, percutaneous endoscopic approach
0SG10A0	Fusion of 2 or more lumbar vertebral joints with interbody fusion device, anterior approach, anterior column, open approach
0SG10AJ	Fusion of 2 or more lumbar vertebral joints with interbody fusion device, posterior approach, anterior column, open approach
0SG13A0	Fusion of 2 or more lumbar vertebral joints with interbody fusion device, anterior approach, anterior column, percutaneous approach
0SG13AJ	Fusion of 2 or more lumbar vertebral joints with interbody fusion device, posterior approach, anterior column, percutaneous approach
0SG14A0	Fusion of 2 or more lumbar vertebral joints with interbody fusion device, anterior approach, anterior column, percutaneous endoscopic approach
0SG14AJ	Fusion of 2 or more lumbar vertebral joints with interbody fusion device, posterior approach, anterior column, percutaneous endoscopic approach
0SG30A0	Fusion of lumbosacral joint with interbody fusion device, anterior approach, anterior column, open approach
0SG30AJ	Fusion of lumbosacral joint with interbody fusion device, posterior approach, anterior column, open approach
0SG33A0	Fusion of lumbosacral joint with interbody fusion device, anterior approach, anterior column, percutaneous approach
0SG33AJ	Fusion of lumbosacral joint with interbody fusion device, posterior approach, anterior column, percutaneous approach
0SG34A0	Fusion of lumbosacral joint with interbody fusion device, anterior approach, anterior column, percutaneous endoscopic approach
0SG34AJ	Fusion of lumbosacral joint with interbody fusion device, posterior approach, anterior column, percutaneous endoscopic approach

For MS–DRGs 456, 457, and 458, the applicant searched the FY 2019 MedPAR dataset for cases reporting a procedure code in Table A in combination with a primary diagnosis code in Table B or a secondary diagnosis code in Table C.

BILLING CODE 4120–01–P

Table A – Procedure Codes	
0RGA3A0	Fusion of thoracolumbar vertebral joint with interbody fusion device, anterior approach, anterior column, percutaneous approach
0RGA3AJ	Fusion of thoracolumbar vertebral joint with interbody fusion device, posterior approach, anterior column, percutaneous approach

BILLING CODE 4120–01–C

The applicant identified 45,331 cases across all six MS–DRGs. The applicant first removed charges to account for the two types of prior technology devices that the applicant asserted are most likely to be replaced by aprevo™ Intervertebral Body Fusion Device. Specifically, the applicant calculated an average cost for the top five selling devices in each category of prior technology, which include standalone ALIF and LLIF lateral expandable cages.[925] The applicant then multiplied the cost of the technology being replaced by three, which, per the applicant, is the number of lumbar cages implanted for the correction of spinal curvature, to arrive at an estimated hospital cost per case.[926] The applicant converted costs to charges by weighting the operating cost-to-charge ratios for each of the 3,315 hospitals in the FY 2021 IPPS/LTCH final rule and correction notice impact file by each hospital's share of the 9,235,824 submitted bills to obtain a national average CCR of 0.2546, of which the inverse is a national-average hospital markup of 393 percent. The applicant then standardized the charges and applied an inflation factor of 13.1 percent, which, per the applicant, is the outlier charge inflation factor used in the FY 2021 IPPS/LTCH final rule (85 FR 59038), to update the charges from FY 2019 to FY 2021. We note that the applicant appears to have used the FY 2021 IPPS/LTCH PPS proposed rule inflation factor rather than the 2-year inflation factor from the FY 2021 IPPS/LTCH PPS final rule of 13.2 percent (85 FR 59039), which would have resulted in a higher inflated charge figure.

The applicant then added charges for the new technology by multiplying the estimated average cost for the aprevo™ Intervertebral Body Fusion Device by three devices per case and converting the cost to charges using the 393 percent hospital charge markup.

The applicant calculated a final inflated case-weighted average standardized charge per case of $247,648 and an average case-weighted threshold of $157,600. Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the technology meets the cost criterion.

We agree with the applicant that the aprevo™ Intervertebral Body Fusion meets the cost criterion and therefore are proposing to approve the aprevo™ Intervertebral Body Fusion device for the indications of ALIF and LLIF, and for the indication of TLIF, subject to the technology receiving FDA marketing authorization for that indication by July 1, 2021, as these indications correspond to the Breakthrough Device designation, for new technology add-on payments for FY 2022.

Based on preliminary information from the applicant at the time of this proposed rule, the cost of the aprevo™ Intervertebral Body Fusion is $31,500, or an estimated average cost of $10,500 per device multiplied by three, which, according to the applicant, is the average number of devices used per procedure. We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are proposing that the maximum new technology add-on payment for a case involving the use of the aprevo™ Intervertebral Body Fusion Device would be $20,475 for FY 2022

[925] Orthopedic Network News. ''2019 Spinal Surgery update.'' Volume 30, No. 4. October 2019.
[926] Ibid.

(that is 65 percent of the average cost of the technology).

We are inviting public comments on whether the aprevo™ Intervertebral Body Fusion Device meets the cost criterion and our proposal to approve new technology add-on payments for aprevo™ Intervertebral Body Fusion Device for FY 2022 for ALIF and LLIF, and for TLIF, subject to the technology receiving marketing authorization for that indication by July 1, 2021.

(2) aScope™ Duodeno

Ambu, Inc. submitted an application for new technology add on payments for the aScope™ Duodeno for FY 2022. The device is a sterile, single-use endoscope for endoscopy and endoscopic surgery indicated for treatment of the upper gastrointestinal (GI) tract. Per the applicant, the device includes a flexible insertion tube with a bendable tip equipped with lighting and camera. According to the applicant, the aScope™ Duodeno is inserted into the mouth of the patient and steered via the esophagus and stomach to the duodenum. The applicant states that single-use scopes eliminate the risk of patient-to-patient transmission of infection related to reprocessing. The applicant also states the device is designed to be used with aBox Duodeno, which is a video processor that outputs video imaging for observation and recording. Per the applicant, the device may also be used with existing external video monitors for image display as well as other endoscopic accessories and equipment.

The aScope™ Duodeno (formerly aScope 1 Duo) was designated as a Breakthrough Device, indicated for use with the aScope Base (now aBox Duodeno), endo-therapy accessories (for example, biopsy forceps) and other ancillary equipment (for example, video monitor) for endoscopy and endoscopic surgery within the duodenum, and received FDA 510(k) clearance as a Class II medical device on July 17, 2020 for the same indication. Per the applicant, the device was available on the market immediately after FDA clearance. According to the applicant, there are currently no unique ICD–10–PCS codes describing the device. The applicant stated that the applicant for EXALT™ Model D, another technology discussed in this section, submitted a request to the ICD–10 Coordination and Maintenance Committee for FY 2022 for a unique code to identify use of single-use duodenoscopes. The applicant further stated that since this code would describe and identify use of aScope, they did not submit a request for approval of a code to uniquely identify the technology.

To demonstrate that the technology meets the cost criterion, the applicant searched the FY 2019 MedPAR Limited Data Set (LDS) for cases reporting one of the following ICD–10–PCS codes commonly used to report endoscopic retrograde cholangiopancreatography (ERCP) and use of duodenoscopes:

0FD48ZX	Extraction of gallbladder, via natural or artificial opening endoscopic, diagnostic
0FD58ZX	Extraction of right hepatic duct, via natural or artificial opening endoscopic, diagnostic
0FD68ZX	Extraction of left hepatic duct, via natural or artificial opening endoscopic, diagnostic
0FD78ZX	Extraction of common hepatic duct, via natural or artificial opening endoscopic, diagnostic
0FD88ZX	Extraction of cystic duct, via natural or artificial opening endoscopic, diagnostic
0FD98ZX	Extraction of common bile duct, via natural or artificial opening endoscopic, diagnostic
0FDC8ZX	Extraction of ampulla of vater, via natural or artificial opening endoscopic, diagnostic
0FDD8ZX	Extraction of pancreatic duct, via natural or artificial opening endoscopic, diagnostic
0FDF8ZX	Extraction of accessory pancreatic duct, via natural or artificial opening endoscopic, diagnostic
0FJ48ZZ	Inspection of gallbladder, via natural or artificial opening endoscopic
0FJB8ZZ	Inspection of hepatobiliary duct, via natural or artificial opening endoscopic
0FJD8ZZ	Inspection of pancreatic duct, via natural or artificial opening endoscopic
0FB48ZX	Excision of gallbladder, via natural or artificial opening endoscopic, diagnostic
0FB58ZX	Excision of right hepatic duct, via natural or artificial opening endoscopic, diagnostic
0FB68ZX	Excision of left hepatic duct, via natural or artificial opening endoscopic, diagnostic
0FB78ZX	Excision of common hepatic duct, via natural or artificial opening endoscopic, diagnostic
0FB88ZX	Excision of cystic duct, via natural or artificial opening endoscopic, diagnostic
0FB98ZX	Excision of common bile duct, via natural or artificial opening endoscopic, diagnostic
0FBC8ZX	Excision of ampulla of vater, via natural or artificial opening endoscopic, diagnostic
0FBD8ZX	Excision of pancreatic duct, via natural or artificial opening endoscopic, diagnostic
0FBF8ZX	Excision of accessory pancreatic duct, via natural or artificial opening endoscopic, diagnostic
0FN98ZZ	Release common bile duct, via natural or artificial opening endoscopic
0FNC8ZZ	Release ampulla of vater, via natural or artificial opening endoscopic
0FND8ZZ	Release pancreatic duct, via natural or artificial opening endoscopic
0FNF8ZZ	Release accessory pancreatic duct, via natural or artificial opening endoscopic
4A0C8BZ	Measurement of biliary pressure, via natural or artificial opening endoscopic
0FF78ZZ	Fragmentation in common hepatic duct, via natural or artificial opening endoscopic
0FF98ZZ	Fragmentation in common bile duct, via natural or artificial opening endoscopic

The applicant excluded MS–DRGs that had fewer than 100 cases from the analysis. The applicant did not say how many cases it excluded based on this criterion.

In total, the applicant identified 54,848 cases across 40 unique MS–DRGs. The applicant then removed charges for prior technology by dividing the per use cost for reusable duodenoscopes and related components [927] by the hospital-specific cost-to-charge ratio from the FY 2021

[927] Derived from Travis, et al. minus the 20 percent overhead cost.

IPPS/LTCH Proposed Rule Impact File at the claims level and averaging the resulting estimated charges by MS–DRG. The applicant then standardized the charges and applied an inflation factor of 13.2 percent, or the 2-year inflation factor used to update the outlier threshold in the FY 2021 IPPS/LTCH final rule (85 FR 59039), to update the charges from FY 2019 to FY 2021. The applicant added charges for the aScope™ Duodeno and related components by dividing the cost per use by the national cost-to-charge ratio of 0.2970 for Supplies and Equipment (85 FR 58601).

The applicant calculated a final inflated average case-weighted standardized charge per case of $89,945 and an average case-weighted threshold of $64,894. Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the technology meets the cost criterion.

We agree with the applicant that the aScope™ Duodeno meets the cost criterion; and therefore, we are proposing to approve the aScope™ Duodeno for new technology add-on payments for FY 2022.

Based on preliminary information from the applicant at the time of this proposed rule, the cost of the aScope™ Duodeno is $2,184.27. However, the applicant noted in its application that this cost is broken down into three components, including the disposable sleeve, the aBox Duodeno (a video processor and light source), and other endoscopic accessories and equipment. We believe it is appropriate to only consider the cost of the disposable sleeve as the cost of the technology, as the other two components, which include the aBox Duodeno and an external monitor that, per the applicant, do not incur new costs per use, would thus be paid for under the IPPS for capital-related costs. As noted previously, because section 1886(d)(5)(K)(i) of the Act requires that the Secretary establish a mechanism to recognize the costs of new medical services or technologies under the payment system established under that subsection, which establishes the system for paying for the operating costs of inpatient hospital services, we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add on payments under the IPPS for capital-related costs. Thus, we believe the operating cost of the aScope™ Duodeno is $1,995.

Based on the information available at the time of this proposed rule, it appears that both aScope™ Duodeno and EXALT™ Model D will be identified by the same ICD–10–PCS code and share the same indication for endoscopy and endoscopic surgery within the duodenum. As we are unable to separately identify these cases to apply two separate payment amounts for these technologies, we are proposing to use a case-weighted average to calculate a single cost that would be used to determine the new technology add-on payment amount for both technologies. To compute the weighted average cost, we summed the total number of projected cases for each of the applicants, which equaled 12,064 (3,750 plus 8,314). Then we divided the number of projected cases for each of the applicants by the total number of cases, which resulted in the following case-weighted percentages: 31 percent for aScope™ Duodeno and 69 percent for EXALT™ Model D. We multiplied the cost per case for the manufacturer specific technology by the case-weighted percentage (0.31 * $1,995 = $620.13 for aScope™ Duodeno and 0.69 * $2,930 = $2,019.23 for EXALT™ Model D). This resulted in a case-weighted average cost of $2,639.36 for both technologies. We are inviting public comments on this proposed case-weighted average, as well as any alternative approaches for determining and applying the new technology add-on payment amount for cases involving these technologies, for FY 2022.

We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are proposing that the maximum new technology add-on payment for a case involving the use of aScope™ Duodeno or EXALT™ Model D would be $1,715.59 for FY 2022 (that is, 65 percent of the case-weighted average cost of both technologies).

We are inviting public comments on whether aScope™ Duodeno meets the cost criterion and our proposal to approve new technology add-on payments for aScope™ Duodeno for FY 2022. We are further inviting public comments on the calculation of the maximum new technology add-on payment amount for the aScope™ Duodeno.

(3) Caption Guidance™

Caption Health, Inc. submitted an application for new technology-add on payments for Caption Guidance™ for FY 2022. Per the applicant, Caption Guidance™ is an artificial intelligence (AI) guided medical imaging acquisition software system indicated for the acquisition of cardiac ultrasound images. The applicant explained that the system provides real-time guidance during transthoracic echocardiography (2D–TTE) to assist in obtaining anatomically correct and optimized images that represent standard 2D echocardiographic diagnostic views and orientations. The applicant also states that the technology is classified by FDA as software as a medical device (SaMD), so in order to use the software, the Caption Guidance™ system must be installed on a compatible third-party ultrasound system.

Caption Guidance™ is designated as a Breakthrough Device, indicated to assist medical professionals in the acquisition of cardiac ultrasound images, and received FDA De Novo approval on February 7, 2020 for the same indication. The applicant stated that an updated version of the system subsequently received 510(k) clearance under 510(k) number K200755 on April 16, 2020 on an expedited basis due to COVID–19. Per the applicant, an interim version of the software became available on March 17, 2020, though not sold, on an emergency basis to assist sites in responding to the COVID–19 pandemic. According to the applicant, the first version of the technology was released commercially on September 15, 2020 with a first date of sale of September 29, 2020. Therefore, we believe that the newness date for this technology is the date on which Caption Guidance™ became available on the market, September 15, 2020. The item is a Class II medical device assigned to product code QJU with descriptor Image Acquisition And/Or Optimization Guided By Artificial Intelligence. According to the applicant, there are currently no unique ICD–10–PCS codes describing the device. The applicant submitted a request to the ICD–10 Coordination and Maintenance Committee for a new code to uniquely identify the technology.

With respect to the cost criterion, the applicant searched the CY 2019 Limited Data Set (LDS)—Carrier Standard Analytic File (SAF), 5 percent sample, for beneficiaries receiving limited echocardiography, as described by Current Procedural Terminology (CPT®) code 93308 (Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, follow-up or limited study) with a place of service code 21 (inpatient hospital) or 23

(emergency department) and the associated inpatient stays. Per the applicant, limited echocardiography, the procedure most likely to include Caption Guidance, is not reliably reported in the inpatient setting. As a result, the applicant used a multi-step approach where corresponding inpatient stays were identified in the CY 2019 LDS—Inpatient SAF for the beneficiaries identified in the Carrier SAF. Inpatient stays were identified by matching on the unique beneficiary ID and by matching the carrier claim date of service against the inpatient admission and discharge dates. The applicant counted an inpatient stay if the date of service for CPT code 93308 occurred on or after the inpatient admission date (or during the three days preceding the date of admission), but was also on or before the discharge date of the hospital stay. The applicant eliminated non-inpatient claims and claims with a payment amount less than or equal to zero, as well as claims from hospitals that are not used in the ratesetting process.

The applicant summarized the remaining claims by MS–DRG, and by principal diagnosis and MS–DRG. The applicant cross-walked the MS–DRG codes to FY 2021 MS–DRG definitions using the MS–DRG grouper for FY 2021 and identified a list of 461 unique MS–DRGs to which cases representing patients who may be eligible for use of Caption Guidance™ mapped. The applicant also utilized data from current Caption Guidance™ customers to obtain a list of principal diagnoses associated with each MS–DRG. The applicant noted that, because this analysis began with the CY 2019 LDS Carrier SAF, 5 percent sample, the inpatient claims captured underrepresent the total number of inpatient stays in which CPT code 93308 is expected to be performed. The applicant applied the unique MS–DRG and principal diagnosis combinations to all inpatient claims in the CY 2018 and CY 2019 LDS SAF with a discharge date in FY 2019. The applicant then removed any claims where there were no billed charges in revenue centers 0480 (Cardiology-General) and 0483 (Cardiology-Echocardiology). The applicant explained that MS–DRG and principal diagnosis alone are unlikely to be a good proxy for performance of CPT code 93308. The applicant noted that there are charges to revenue centers 0480 and 0483 among nearly 100 percent of cases identified, and that no other revenue centers were billed at such high frequency. The applicant explained that it did not use the FY 2021 MedPAR LDS for this reason, as the dataset does not report charges by revenue center.

The applicant identified 1,932,386 cases mapping to 461 MS–DRGs. Then the applicant standardized the charges and applied the 2-year charge inflation factor used to adjust the outlier threshold determination, which the applicant stated was 10.22 percent. We note that the applicant appears to have used an inflation factor lower than the FY 2021 IPPS/LTCH PPS final rule of 13.2 percent (85 FR 59039), which would have resulted in a higher inflated charge figure. The applicant did not remove charges for prior technology as the applicant maintained that no existing technology is comparable to Caption Guidance™.

The applicant then added charges for the new technology. The applicant calculated the technology's cost per case in a multi-step process. First, the applicant multiplied the cost of Caption Guidance™ by the number of devices under the CCN of each subscribing provider to obtain a provider-specific total device cost. Next, for each subscribing provider, the applicant identified Medicare inpatient cases that would be eligible for Caption Guidance™ using the criteria and methodology described previously. The applicant then multiplied the number of inpatient cases by 15 percent, which per the applicant is consistent with published evidence that the percent of limited echocardiography cases ranged from 12 to 15 percent of all inpatient echocardiography services.[928] The applicant then added the number of Medicare hospital outpatient cases for CPT code 93308 for each subscribing provider to the estimated inpatient limited echocardiography utilization to estimate total Medicare limited echocardiography by provider. The applicant divided the total Medicare inpatient and outpatient cases receiving limited echocardiogram by an average Medicare share of 63 percent, which the applicant estimated by analyzing discharges reporting three ICD–10–PCS codes: B244ZZZ (Ultrasonography of right heart), B245ZZZ (Ultrasonography of left heart), and B246ZZZ (Ultrasonography of right and left heart) from HCUPnet's Nationwide Inpatient Sample, 2017, to obtain the total limited echocardiography cases. The applicant then divided the total device cost by the total limited echocardiography cases to obtain a provider-specific cost per case, which it then averaged across all subscriber hospitals. Finally, the applicant converted the cost per case to charges per case by dividing the cost per case by the national average cost-to-charge ratio for the cardiology cost center of 0.094 (85 FR 58601).

The applicant calculated a final inflated case-weighted average standardized charge per case of $113,435 and an average case-weighted threshold of $69,197. Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the technology meets the cost criterion.

We agree with the applicant that, using the cost per case provided by the applicant, the Caption Guidance™ system would meet the cost criterion and therefore are proposing to approve the Caption Guidance™ system for new technology add-on payments for FY 2022. However, as we note later in this section, because the cost per case can vary based on utilization of the technology, we would like further information on whether the Caption Guidance™ system would still meet the cost criterion if, for instance, an increase in utilization resulted in a cost per case that is lower than the figure the applicant provided.

Based on preliminary information from the applicant at the time of this proposed rule, the cost of the Caption Guidance™ system is $2,874. We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are proposing that the maximum new technology add-on payment for a case involving the use of the Caption Guidance™ system would be $1,868.10 for FY 2022 (that is 65 percent of the average cost of the technology). However, we refer the reader to our discussion and request for comments regarding our concerns with respect to determining a cost per case for a technology that utilizes a subscription for its cost, and note that we may consider finalizing a different add-on payment amount after consideration of comments received.

The applicant appears to have used a single list price of Caption Guidance™ per hospital with a cost per patient that can vary based on the volume of cases. We are interested in information about

[928] Ward RP, Lee L, Ward TJ, Lang RM. Utilization and Appropriateness of Transthoracic Echocardiography in Response to the COVID–19 Pandemic. *J Am Soc Echocardiogr.* 2020 June;33(6):690–691. doi: 10.1016/j.echo.2020.04.006. Epub 2020 April 10.

whether the cost per patient varies based on the utilization of the technology by the hospitals. The cost per patient could be skewed by the small number of hospitals utilizing the technology and their low case volumes. It is possible, if hospitals with large patient populations adopt Caption Guidance™, the cost per patient would be significantly lower.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58628), in a similar instance, we stated our understanding that there are unique circumstances to determining a cost per case for a technology that utilizes a subscription for its cost. We continue to welcome comments from the public as to the appropriate method to determine a cost per case for such technologies, including comments on whether the cost per case should be estimated based on subscriber hospital data as described previously, and if so, whether the cost analysis should be updated based on the most recent subscriber data for each year for which the technology may be eligible for the new technology add-on payment.

We invite public comments on whether the Caption Guidance™ system meets the cost criterion and our proposal to approve new technology add-on payments for Caption Guidance™ system for FY 2022, including on whether the newness period for this technology would begin on September 15, 2020.

(4) CERAMENT® G

BONESUPPORT Inc. submitted an application for new technology-add on payments for CERAMENT® G for FY 2022. Per the applicant, CERAMENT® G is an injectable bone-void filler made of calcium sulfate, hydroxyapatite, and gentamicin sulfate indicated for the surgical treatment of osteomyelitis. Per the applicant, this bone graft substitute fills gaps resulting from debridement of infected bone and prevents colonization of sensitive bacteria, promoting bone healing in two ways. The applicant stated that the primary mode of action is for CERAMENT® G to act as a resorbable ceramic bone-void filler intended to fill gaps and voids in the skeleton system created when infected bone is debrided. The applicant also stated that the secondary mode of action is to prevent the colonization of gentamicin-sensitive microorganisms in order to protect bone healing. Per the applicant, CERAMENT® G may eliminate the need to harvest autologous bone, avoiding pain and infection at the donor site.

CERAMENT® G is designated as a Breakthrough Device for use as a bone-void filler as an adjunct to systemic antibiotic therapy and surgical debridement as part of the surgical treatment of osteomyelitis. It has not yet received FDA 510(k) clearance. According to the applicant, there are no available codes that adequately describe the product CERAMENT® G. The applicant submitted a request to the ICD–10 Coordination and Maintenance Committee for approval of a code to uniquely identify the technology.

With respect to the cost criterion, the applicant used the MS–DRG grouping function within FindACode software in conjunction with the online MS–DRG v37.0 Definitions Manual to identify the appropriate MS–DRGs to which potential cases that may be eligible for treatment with CERAMENT® G would most likely map. The applicant identified the following seven relevant MS–DRGs:

MS-DRG	DESCRIPTOR
464	Wound debridement and skin graft except hand for musculoskeletal system and connective tissue disorders with CC
493	Lower extremity and humerus procedures except hip, foot and femur with CC
496	Local excision and removal of internal fixation devices except hip and femur with CC
498	Local excision and removal internal fixation devices of hip and femur with CC/MCC
504	Foot procedures with CC
511	Shoulder, elbow or forearm procedures, except major joint procedures with CC
516	Other musculoskeletal system and connective tissue O.R. procedures with CC

The applicant conducted a review of ICD–10–PCS codes for procedures that would use CERAMENT® G. For each MS–DRG, the applicant searched for cases reporting a diagnosis code from the Osteomyelitis category in combination with one of the procedure codes listed in the table that follows.

	0QDR0ZZ	Extraction of left toe phalanx, open approach

BILLING CODE 4120–01–C

The applicant identified 7,994 cases across the seven MS–DRGs. The applicant then removed charges for prior technology that may be replaced by CERAMENT® G. The applicant conducted a market analysis that identified 3 types of prior technology devices: Poly (methyl methacrylate) (PMMA) manually mixed with antibiotics, PMMA pre-loaded with antibiotics, and calcium sulfate (CaS) mixed with antibiotics. The applicant researched the average sales price (ASP) for major competitors for 5cc and 10cc of each device type and calculated a weighted average cost of $444 per 5cc and $727 per 10 cc.[929] Then the applicant converted costs to charges by weighting the operating cost-to-charge ratios for 3,315 hospitals in the FY 2021 IPPS/LTCH PPS final rule and correction notice impact file by each hospital's share of the 9,235,824 submitted bills to obtain a national average CCR of 0.2546, of which the inverse is a national-average hospital markup of 393 percent. The applicant then standardized the charges and applied an inflation factor of 13.1 percent, or the 2-year inflation factor used to update the outlier threshold in the FY 2021 IPPS/LTCH PPS final rule, to update the charges from FY 2019 to FY 2021. We note that the applicant appears to have used the FY 2021 IPPS/LTCH PPS proposed rule inflation factor rather than the 2-year inflation factor from the FY 2021 IPPS/LTCH PPS final rule of 13.2 percent (85 FR 59039), which would have resulted in a higher inflated charge figure. The applicant added charges for the new technology by multiplying the estimated average cost for 5cc and 10cc of CERAMENT® G by the 393 percent hospital charge markup.

The applicant calculated a final inflated case-weighted average standardized charge per case of $107,671 and an average case-weighted threshold of $76,791. Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the technology meets the cost criterion.

We agree with the applicant that CERAMENT® G meets the cost criterion; and therefore, subject to the technology receiving FDA marketing authorization for use as a bone-void filler as an adjunct to systemic antibiotic therapy and surgical debridement as part of the surgical treatment of osteomyelitis by July 1, 2021, we are proposing to approve CERAMENT® G for new technology add-on payments for FY 2022.

Based on preliminary information from the applicant at the time of this proposed rule, the cost of CERAMENT® G is $6,020 per procedure. Per the applicant, the amount of CERAMENT® G used per patient depends on the location and size of the bone void. The applicant expects that a typical patient will require 5–10cc per procedure, with large and more complex cases requiring higher volumes. The applicant estimated that 70 percent of patients will receive 5cc and 30 percent of patients will receive 10 cc of CERAMENT® G, resulting in a weighted average cost of $6,020 per patient. We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are proposing that the maximum new technology add-on payment for a case involving the use of the product CERAMENT® G would be $3,913 for FY 2022 (that is 65 percent of the average cost of the technology).

[929] The applicant's analysis was informed by 2019 and 2020 data for its competitors from three sources: an iData Market Research 2019 Sku Data Report, Global Data US Hospital Bone Grafts and Substitutes Q3 2019 Report, and feedback from sales representatives in the field.

We are inviting public comments on whether CERAMENT® G meets the cost criterion and our proposal to approve new technology add-on payments for CERAMENT® G for FY 2022, subject to CERAMENT® G receiving FDA marketing authorization for use as a bone-void filler as an adjunct to systemic antibiotic therapy and surgical debridement as part of the surgical treatment of osteomyelitis by July 1, 2021.

(5) EXALT™ Model D Single-Use Duodenoscope

Boston Scientific Corporation submitted an application for new technology-add on payments for EXALT™ Model D Single-Use Duodenoscope (EXALT™) for FY 2022. Per the applicant, EXALT™ is a single-use, flexible duodenoscope indicated for diagnostic and therapeutic treatment of the pancreaticobiliary system during endoscopic retrograde cholangiopancreatography (ERCP) procedures. According to the applicant, the scope is most commonly used to facilitate therapeutic maneuvers such as removal of gallstones from the bile ducts, dilation of strictures in the bile or pancreatic ducts, or to relieve an obstruction by inserting a plastic or metal stent. The applicant states that EXALT™ is intended to eliminate the risk of patient-to-patient transmission of infection related to reprocessing of reusable duodenoscopes.

EXALT™ is designated as a Breakthrough Device, indicated for intended use with a Boston Scientific endoscopic video imaging system for endoscopy and endoscopic surgery within the duodenum, and received FDA 510(k) clearance as a Class II medical device on December 13, 2019 for the same indication. The applicant indicates that this device is the first FDA-cleared single-use duodenoscope in the U.S. According to the applicant, EXALT™ was available on the market immediately after FDA approval. The applicant listed 50 ICD–10–PCS codes that describe ERCP and other procedures in which EXALT™ and other duodenoscopes are used. The applicant submitted a request to the ICD–10 Coordination and Maintenance Committee for approval of a code to uniquely identify the technology.

With respect to the cost criterion, the applicant conducted two analyses based on 100 percent of identified claims and 76 percent of identified claims, both of which are further described later in this section. To identify potential cases where EXALT™ could be utilized, the applicant searched the FY 2019 MedPAR file for the following ICD–10–PCS codes:

BILLING CODE 4120–01–P

0F558ZZ	Destruction of right hepatic duct, via natural or artificial opening endoscopic

0FPD80Z	Removal of drainage device from pancreatic duct, endoscopic
0FPD8DZ	Removal of intraluminal device from pancreatic duct, endoscopic

BILLING CODE 4120–01–C

For the analysis using 100 percent of cases, the applicant identified a total of 59,966 cases spanning 440 MS–DRGs. The applicant then removed 100 percent of charges associated with the service Medical/Surgical Supplies and Devices for the prior technology. The applicant stated that it does not believe use of EXALT™ will replace any other medical supplies but removed 100 percent of charges associated with service category Medical/Surgical Supply Charge Amount, which included the revenue center code 027x, to be as conservative as possible. The applicant then standardized the charges and applied an inflation factor of 13.2 percent, which is the same inflation factor used by CMS to update the outlier threshold in the FY 2021 IPPS/LTCH PPS final rule, to update the charges

from FY 2019 to FY 2021 (85 FR 59039). The applicant added charges for the new technology by multiplying the cost of the technology by the national CCR for implantable devices from the FY 2021 IPPS/LTCH PPS final rule. Under the analysis based on 100 percent of claims, the applicant determined an average case-weighted threshold amount of $66,588 and a final inflated case weighted average standardized charge per case of $96,079.

For the analysis using 76 percent of cases, which the applicant conducted due to these cases mapping to just 14 MS–DRGs, the applicant used the same methodology, which identified 45,530 cases across 14 MS–DRGs. The applicant determined an average case-weighted threshold amount of $63,762 and a final inflated case weighted average standardized charge per case of $84,631. Because the final inflated case-weighted average standardized charge per case exceeded the average case-weighted threshold amount for both analyses, the applicant asserted that the technology meets the cost criterion.

We are concerned that the applicant used the national CCR for implantable devices from the FY 2021 IPPS/LTCH PPS final rule, as a duodenoscope is not an implantable device. We note that the cost analysis for another duodenoscope that is the subject of an application for new technology add-on payments for FY 2022, the aScope™ Duodeno, used the national CCR for supplies and equipment to convert the cost of the technology to charges, and we believe that the same CCR should apply for purposes of the cost analysis for EXALT™ Model D Single-Use Duodenoscope.

We agree with the applicant that EXALT™ Model D Single-Use Duodenoscope meets the cost criterion and therefore are proposing to approve EXALT™ Model D Single-Use Duodenoscope for new technology add on payments for FY 2022.

As discussed previously, based on the information available at the time of this proposed rule, it appears that both aScope™ Duodeno and EXALT™ Model D will be identified by the same ICD–10–PCS code and share the same indication for endoscopy and endoscopic surgery within the duodenum. Thus, as we are unable to separately identify these cases to apply two separate payment amounts for these technologies, we are proposing to use a case-weighted average to calculate a single cost that would be used to determine the new technology add-on payment amount for both technologies. To compute the weighted average cost, we summed the total number of projected cases for each of the applicants, which equaled 12,064 (3,750 plus 8,314). Then we divided the number of projected cases for each of the applicants by the total number of cases, which resulted in the following case-weighted percentages: 31 percent for aScope™ Duodeno and 69 percent for EXALT™ Model D. We then multiplied the cost per case for the manufacturer specific technology by the case-weighted percentage (0.31 * $1,995 = $620.13 for aScope™ Duodeno and 0.69 * $2,930 = $2,019.23 for EXALT™ Model D). This resulted in a case-weighted average cost of $2,639.36 for both technologies. We are inviting public comments on this proposed case-weighted average, as well as any alternative approaches for determining and applying the new technology add-on payment amount for cases involving these technologies, for FY 2022.

We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are proposing that the maximum new technology add-on payment for a case involving the use of the product EXALT™ Model D Single-Use Duodenoscope or aScope™ Duodeno would be $1,715.59 for FY 2022 (that is 65 percent of the case-weighted average cost of both technologies).

We are inviting public comments on whether EXALT™ Model D Single-Use Duodenoscope meets the cost criterion and our proposal to approve new technology add-on payments for EXALT™ Model D Single-Use Duodenoscope for FY 2022. We are further inviting public comments on our calculation of the maximum new technology add-on payment amount for the EXALT™ Model D.

(6) FUJIFILM EP–7000X System

Fujifilm Corporation submitted an application for new technology-add on payments for FUJIFILM EP–7000X System for FY 2022. The FUJIFILM EP–7000X system is an endoscopic video imaging system used for endoscopic observation, diagnosis, treatment, and image recording in minimally invasive surgeries of abdominal gynecologic and thoracic areas. Per the applicant, this system allows for the visualization of hemoglobin oxygen saturation levels of blood in superficial tissue under a 2D endoscopic image, which helps physicians identify tissue that is not appropriately oxygenated and thus potentially ischemic. The applicant further explains that the technology consists of four components: Video Laparoscope EL–R740M, Processor VP–7000, Light Source BL–7000X, and Image Processing Unit EX–0.

The FUJIFILM EP–7000X system received Breakthrough Device designation for endoscopic observation, diagnosis, treatment, and image recording in patients requiring such procedures on September 17, 2020 and has not yet been granted FDA approval. According to the applicant, there are currently no unique ICD–10–PCS codes describing the system. The applicant submitted a request to the ICD–10 Coordination and Maintenance Committee for approval of a unique code for FY 2022 to identify the technology.

With respect to the cost criterion, the applicant searched the FY 2019 MedPAR claims data file to identify potential cases representing patients who may be eligible for treatment with the EP–7000X System. The applicant identified claims that reported an ICD–10–PCS procedure code for gastrointestinal bypass or hernia repair, which the applicant listed in the following table:

BILLING CODE 4120–01–P

0D11476	Bypass upper esophagus to stomach with autologous tissue substitute, percutaneous endoscopic approach
0D11479	Bypass upper esophagus to duodenum with autologous tissue substitute, percutaneous endoscopic approach

BILLING CODE 4120–01–C

Per the applicant, oxygen saturation endoscopic imaging would not be necessary, as both imaging procedures are used to evaluate vascular perfusion and therefore the applicant excluded cases with the ICD–10–PCS procedure code 4A1BXSH (Monitoring of Gastrointestinal Vascular Perfusion using Indocyanine Green Dye, External Approach). In addition, the applicant compared cases with procedure code 4A1BXSH to cases without procedure code 4A1BXSH and found that cases with the procedure code have higher total standardized charges. The applicant further limited the cases to MS–DRGs with at least one percent of case volume, leaving 12,020 cases spread across 16 MS–DRGs, or 83 percent of the 14,522 cases initially identified. The applicant standardized the charges and applied an inflation factor of 13.2 percent, which is the same inflation factor used by CMS to update the outlier threshold in the FY 2021 IPPS/LTCH PPS final rule, to update the charges from FY 2019 to FY 2021 (85 FR 59039). The applicant did not remove charges for the current technology as the applicant believed the use of EP–87000X System would not replace any other therapies except for the vascular perfusion monitoring procedure for which cases were already excluded.

The applicant then added charges for the new technology. The applicant explained that the total cost of the EP–87000X System consists of the capital equipment as well as a service contract for the equipment and a calibration fee required to perform a calibration between a video laparoscope and light source every 6 months. The applicant stated that it calculated the equipment cost per minute using the Medicare physician fee schedule formula used for calculating practice expense relative value units (RVUs). The applicant stated that it also assumed a 3 percent usage rate, a 5.5 percent interest rate, a 0 percent maintenance factor (as the maintenance fee is built into the cost of the equipment), and a 5-year useful life. The applicant multiplied the machine cost per minute by the number of minutes of procedure time, which the applicant estimated to be 4.5 hours or 270 minutes, to obtain the per patient cost. The applicant then converted the cost to charges by dividing the cost per patient by the national average cost-to-charge ratio for supplies and equipment (0.297).

Based on the cost information, the applicant calculated a final inflated case-weighted average standardized charge per case of $106,603 and an average case-weighted threshold of $80,392. Because the final inflated case-weighted average standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the technology meets the cost criterion.

As noted previously, because section 1886(d)(5)(K)(i) of the Act requires that the Secretary establish a mechanism to recognize the costs of new medical services or technologies under the payment system established under that subsection, which establishes the system for paying for the operating costs of inpatient hospital services, we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add-on payments under the IPPS for capital-related costs. Based on preliminary information from the applicant, it appears that the costs of the FUJIFILM EP–7000X System do not include any operating costs. Therefore, even if the technology meets the cost criterion, it appears that no new technology add-on payment would be made for the FUJIFILM EP–7000X System because, as discussed in prior rulemaking and noted previously, we only make new technology add-on payments for operating costs (72 FR 47307 through 47308). However, we are inviting public comments on whether the FUJIFILM EP–7000X System has any operating costs. If the FUJIFILM EP–7000X System does have operating costs, since it appears to meet the cost criterion as previously noted, we are proposing to approve new technology add-on payments for only the operating costs of the FUJIFILM EP–7000X System for FY 2022, subject to the technology receiving FDA marketing authorization for endoscopic observation, diagnosis, treatment, and image recording in patients requiring such procedures by July 1, 2021.

(7) Harmony™ Transcatheter Pulmonary Valve (TPV) System

Medtronic submitted an application for new technology-add on payments for Harmony™ Transcatheter Pulmonary Valve (TPV) System (''Harmony™'') for FY 2022. The system consists of a bioprosthetic heart valve developed from porcine pericardial tissue mounted on self-expanding nitinol struts sewn to a polyester fabric. According to the applicant, Harmony™ is implanted in the patient's heart between the right ventricle and the bifurcation of the pulmonary arteries to treat patients with congenital heart disease who are indicated for a pulmonary valve replacement. The applicant states that Harmony™ is the first transcatheter pulmonary valve that is designed to treat the patient's condition at the native site of the pulmonary valve without a pre-existing valve conduit or pre-existing bioprosthetic valve.

The Harmony™ TPV System received designation as a Breakthrough Device on

May 1, 2019, with the indication for the treatment of symptomatic severe pulmonary regurgitation in patients with a surgically-repaired right ventricular outflow tract. The applicant anticipates receiving 510(k) clearance for Class III medical device by June 2021. Additionally, the applicant noted that the proposed indication for the pending FDA marketing authorization is more expansive than the indication for the FDA Breakthrough Device status, to include patients who have had a prior transcatheter intervention. We note that under the eligibility criteria for approval under the alternative pathway for certain transformative new devices, only the use of the Harmony™ TPV System for the treatment of symptomatic severe pulmonary regurgitation in patients with a surgically-repaired right ventricular outflow tract, and the FDA Breakthrough Device designation it received for that use, are relevant for purposes of the new technology add-on payment application for FY 2022.

According to the applicant, there are currently no unique ICD–10–PCS codes describing the Harmony™ Transcatheter Pulmonary Valve (TPV). The applicant noted that the Harmony™ TPV System is currently reported within table 02R of the ICD–10 PCS tabular list (body part value Pulmonary Valve, approach value Percutaneous, device value as appropriate, and qualifier value No Qualifier). Per the applicant, this same code also applies to existing technology for transcatheter valve replacement within a conduit or a pre-existing prosthetic valve. The applicant submitted a request to the ICD–10 Coordination and Maintenance Committee for approval of a unique code for FY 2022 to identify the technology.

With respect to the cost criterion, the applicant searched the FY 2019 MedPAR dataset for claims representing patients with congenital diagnoses who received a surgical valve or a transcatheter procedure. The applicant identified claims across five MS–DRGs after excluding cases with outlier payments. Per the applicant, 6 percent of cases were in MS–DRG 216, 24 percent of cases were in MS–DRG 219, 12 percent of cases were in MS–DRG 220, 26 percent of cases were in MS–DRG 266, and 32 percent of cases were in MS–DRG 267. The applicant did not provide case counts because the volume in each MS–DRG was fewer than 11 cases.

Next, the applicant removed charges for the prior technology and standardized the charges. The applicant described the charges for the technology that would be replaced as ''the sum of the medical-surgical pacemaker amount, the intraocular lens amount, the other implants amount, and the investigational device amount.'' The applicant also removed charges related to the prior technology, which it described as ''the sum of the medical surgical supplies amount, the durable medical equipment amount, and the used durable medical amount minus the prior technology charges.'' The applicant then applied an inflation factor of 13.1 percent, which per the applicant is the same inflation factor used by CMS to update the outlier threshold in the FY 2021 IPPS/LTCH PPS final rule, to update the charges from FY 2019 to FY 2021. We note that the applicant appears to have used the FY 2021 IPPS/LTCH PPS proposed rule inflation factor rather than the 2-year inflation factor from the FY 2021 IPPS/LTCH PPS final rule of 13.2 percent (85 FR 59039), which would have resulted in a higher inflated charge figure. The applicant added charges for the new technology by dividing the cost of the Harmony™ TPV by the national CCR for implantable devices, which is 0.293 (85 FR 58601). The applicant also added charges related to the new technology, which the applicant estimated to be similar to the charges related to transcatheter procedures within MS–DRGs 266–267.

The applicant calculated a final inflated case-weighted average standardized charge per case of $257,970 and an average case-weighted threshold of $202,037. Because the final inflated case-weighted average standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the technology meets the cost criterion.

We are concerned that the applicant's charge threshold analysis utilized a small sample of 55 cases, given that the applicant projected a case volume of over 1,000 cases for FY 2022. Subject to the applicant adequately addressing this concern, we would agree that the technology meets the cost criterion and therefore are proposing to approve Harmony™ Transcatheter Pulmonary Valve (TPV) System for new technology add-on payments for FY 2022, subject to the technology receiving FDA marketing authorization for the treatment of symptomatic severe pulmonary regurgitation in patients with a surgically-repaired right ventricular outflow tract by July 1, 2021. As noted previously, only the use of the Harmony™ TPV System for the treatment of symptomatic severe pulmonary regurgitation in patients with a surgically-repaired right ventricular outflow tract, and the FDA Breakthrough Device designation it received for that use, are relevant for purposes of the new technology add-on payment application for FY 2022.

Based on preliminary information from the applicant at the time of this proposed rule, the cost of the Harmony™ Transcatheter Pulmonary Valve (TPV) System is $41,500. Per the applicant, this cost is comprised of $33,000 for the Harmony™ TPV and $8,500 for the Harmony™ transcatheter pulmonary valve delivery and loading system. It is not clear to us whether these costs reflect the use of capital equipment. We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, if both components of the Harmony™ Transcatheter Pulmonary Valve (TPV) System are operating costs, we are proposing that the maximum new technology add-on payment for a case involving the use of the Harmony™ Transcatheter Pulmonary Valve (TPV) System would be $26,975 for FY 2022 (that is 65 percent of the average cost of the technology).

We are inviting public comments on whether the Harmony™ Transcatheter Pulmonary Valve (TPV) System meets the cost criterion and our proposal to approve new technology add-on payments for Harmony™ Transcatheter Pulmonary Valve (TPV) System for FY 2022, subject to FDA marketing authorization of Harmony™ Transcatheter Pulmonary Valve (TPV) System by July 1, 2021 for the treatment of patients with severe pulmonary regurgitation who have had prior intervention on the right ventricular outflow tract and are clinically indicated for a pulmonary valve replacement. We are also inviting public comment on whether the costs of the Harmony™ TPV and Harmony™ transcatheter pulmonary valve delivery and loading system reflect use of capital equipment.

(8) Neovasc Reducer™

Neovasc Inc. submitted an application for new technology-add on payments for the Neovasc Reducer™ System for FY 2022. The Neovasc Reducer™ System is a permanent implant inserted percutaneously into the coronary sinus and indicated for relief of angina symptoms in patients with refractory

angina. According to the applicant, the device creates a permanent and controlled narrowing of the coronary sinus to improve perfusion to ischemic myocardium with its hourglass shape. Per the applicant, the focal narrowing works to generate a pressure gradient and redistribute blood flow to ischemic areas of the heart.

The Neovasc Reducer™ System was designated as a Breakthrough Device on October 10, 2018, indicated for use in patients with refractory angina pectoris despite guideline-directed medical therapy who are unsuitable for revascularization by coronary artery bypass grafting (CABG) or by percutaneous coronary intervention (PCI), and anticipates receiving Pre-Market Approval as a Class III medical device in the first half of 2021.

According to the applicant, there are no unique ICD–10–PCS procedure codes to report the implantation of the device; however, the applicant noted that facilities could report the insertion of the Reducer™ System with ICD–10–PCS code 02H43DZ (Insertion of intraluminal device into coronary vein, percutaneous approach). Similarly, the applicant indicated that there are no unique ICD–10–CM diagnosis codes to report refractory angina; however, facilities might use ICD–10–CM diagnosis codes I20.8 'Other forms of angina pectoris' or I20.9 'Angina pectoris, unspecified' to report refractory angina. The applicant submitted a request to the ICD–10 Coordination and Maintenance Committee for approval for a new ICD–10–PCS procedure code for the implantation of the device and a new ICD–10–CM diagnosis code for refractory angina for FY 2022 to identify the technology.

With respect to the cost criterion, the applicant searched the FY 2019 MedPAR dataset for claims with an ICD–10–PCS procedure code of 02L73DK (Occlusion of left atrial appendage with intraluminal device, percutaneous approach) and 027034Z (Dilation of coronary artery, one artery with drug-eluting intraluminal device, percutaneous approach).

The applicant explained that patients who may be eligible for the Neovasc Reducer would be those diagnosed with refractory angina. The applicant further explained that because there is by definition no treatment for refractory angina, cases admitted to an inpatient hospital with a diagnosis of refractory angina were almost exclusively assigned to medical MS–DRGs that do not resemble a cardiac procedure in terms of clinical or resource use.

Per the applicant, Left Atrial Appendage (LAA) Occlusion is most closely related to the new technology, as it is a venous procedure using a permanent implant that is generally performed on a stable patient and requires a 1- to 2-day hospital stay. The applicant used the refractory angina cases to establish the eligible case count and the ratio between cases ''with complication and comorbidity (CC)'' and ''with major complication and comorbidity (MCC)'' versus cases ''without CC/MCC''. The applicant stated that it used this ratio to weight the MS–DRGs to which the LAA procedure cases mapped, as the refractory angina patient population differs in terms of comorbidities and severity of illness compared to the patient population receiving LAA.

The applicant identified a total of 16,182 LAA cases mapping to MS–DRGs 273 or 274. The applicant then removed the implantable device charges for the prior technology. The applicant also removed charges for cardiac catheterization, the operating room, and supplies and equipment. The applicant then standardized the charges and applied an inflation factor of 13.2 percent, which is the same inflation factor used by CMS to update the outlier threshold in the FY 2021 IPPS/LTCH PPS final rule (85 FR 89039), to update the charges from FY 2019 to FY 2021. The applicant added charges for the new technology, which it calculated by dividing the cost of the Reducer device by the national cost-to-charge ratio for implantable devices (0.239). The applicant noted that the charges for the new technology were not inflated.

As noted previously, the refractory angina patient population differs in terms of comorbidities and severity of illness compared to the patient population receiving LAA. Therefore, the applicant adjusted the volume weights for MS–DRGs 274/273 to reflect the refractory angina population. The applicant extracted cases with an ICD–10–CM diagnosis code I20.8 (Other forms of angina pectoris) and I20.9 (Angina pectoris, unspecified) from the FY 2019 MedPAR dataset. The applicant identified 9,548 cases with a refractory angina diagnosis spread across 513 MS–DRGs. The applicant divided cases into two groups—those mapping to an MS–DRG with a CC or MCC designation and those mapping to an MS–DRG without CC or MCC. The applicant found that the ratio of cases with CC/MCC to cases without CC/MCC was 61/39. The applicant applied this ratio to the refractory angina cases assigned to MS–DRGs with no CC/MCC designation and filled in the volumes by MS–DRG (39 percent of refractory angina cases were assigned to MS–DRG 274 and 61 percent to MS–DRG 273).

The applicant calculated a final inflated case-weighted average standardized charge per case of $141,304 and an average case-weighted threshold of $127,659. Because the final inflated case-weighted average standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the technology meets the cost criterion.

We agree with the applicant that the Neovasc Reducer™ System meets the cost criterion and therefore are proposing to approve the Neovasc Reducer™ System for new technology add-on payments for FY 2022, subject to the technology receiving FDA marketing authorization for use in patients with refractory angina pectoris despite guideline-directed medical therapy who are unsuitable for revascularization by CABG or by PCI by July 1, 2021.

Based on preliminary information from the applicant at the time of this proposed rule, the cost of the Neovasc Reducer™ System is $15,000. We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are proposing that the maximum new technology add-on payment for a case involving the use of the Neovasc Reducer™ System would be $9,750 for FY 2022 (that is 65 percent of the average cost of the technology).

We are inviting public comments on whether the Neovasc Reducer™ System meets the cost criterion and our proposal to approve new technology add-on payments for Neovasc Reducer™ System for FY 2022, subject to the Neovasc Reducer™ receiving FDA marketing authorization by July 1, 2021 for use in patients with refractory angina pectoris despite guideline-directed medical therapy who are unsuitable for revascularization by coronary artery bypass grafting (CABG) or by percutaneous coronary intervention (PCI).

(9) Phagenyx® System

Phagenesis Ltd. submitted an application for new technology-add on payments for Phagenyx® System for FY 2022. The Phagenyx® system (Phagenyx®) is a neurostimulation device for the treatment of neurogenic dysphagia, which is often seen after

stroke, traumatic brain injury, or prolonged mechanical ventilation. Per the applicant, the system is comprised of a sterile single-use per patient catheter, introduced nasally and extending as far as the patient's stomach; and a base station, described as a touch screen user interface that facilitates the optimization of stimulation levels and stores patient and treatment information. Per the applicant, treatment involves the use of electric pulses to stimulate sensory nerves in the oropharynx.

The Phagenyx® system received Breakthrough Device designation on December 4, 2019 and anticipates receiving De Novo FDA clearance by the second quarter of CY 2021. Per the applicant, the FDA granted Breakthrough Device designation for use in treating neurogenic dysphagia in adult tracheotomized patients weaned from ventilation. The applicant noted that their De Novo application to FDA has a broader proposed indication, which states that it is intended for the treatment of non-progressive neurogenic dysphagia in adult patients, and explained that there are current plans to request an expanded Breakthrough Designation to align with this broader labelling. We note that, under the eligibility criteria for approval under the alternative pathway for certain transformative new devices, only the use of the Phagenyx® system for the treatment of neurogenic dysphagia in adult tracheotomized patients weaned from ventilation, and the FDA Breakthrough Device designation it received for that use, are relevant for purposes of the new technology add-on payment application for FY 2022, unless an expanded Breakthrough Designation that aligns with FDA labelling is also granted by the FDA marketing authorization deadline.

According to the applicant, there are currently no unique ICD–10–PCS codes describing the Phagenyx® system. The applicant submitted a request to the ICD–10 Coordination and Maintenance Committee for approval of a unique code for FY 2022 to identify the technology.

With respect to the cost criterion, the applicant performed two analyses based on its Breakthrough Designation indication and the broader proposed indication. For both scenarios, the applicant used the FY 2019 MedPAR dataset to assess the MS–DRGs to which potential cases representing patients who may be eligible for the Phagenyx® System would most likely map. Under the first analysis based on the applicant's Breakthrough designation indication, the applicant searched for claims reporting an ICD–10–PCS procedure code for tracheostomy in combination with an ICD–10–CM diagnosis code for dysphagia.

Tracheostomy ICD-10-PCS Codes	
0B110F4	Bypass trachea to cutaneous with tracheostomy device, open approach
0B113F4	Bypass trachea to cutaneous with tracheostomy device, percutaneous approach
0B114F4	Bypass trachea to cutaneous with tracheostomy device, percutaneous endoscopic approach
0BW10FZ	Revision of tracheostomy device in trachea, open approach
0BW13FZ	Revision of tracheostomy device in trachea, percutaneous approach
0BW14FZ	Revision of tracheostomy device in trachea, percutaneous endoscopic approach
0BW17FZ	Revision of tracheostomy device in trachea, via natural or artificial opening
0BW18FZ	Revision of tracheostomy device in trachea, via natural or artificial opening endoscopic
0BW1XFZ	Revision of tracheostomy device in trachea, external approach
0B21XFZ	Change tracheostomy device in trachea, external approach

Dysphagia ICD-10-CM Codes	
R13.10	Unspecified
R13.12	Oropharyngeal phase
R13.13	Pharyngeal phase
R13.14	Pharyngoesophageal phase
R13.19	Other dysphagia

The applicant identified 8,181 cases spanning 170 MS–DRGs. Per the applicant, 69 percent of the discharges were in MS–DRGs 003 and 004, which is consistent with the applicant's assertion that cases involving tracheostomized patients typically map to these MS–DRGs.

Under the second analysis, based on the applicant's proposed broader indication, the applicant searched for claims reporting an ICD–10–CM diagnosis code for dysphagia, then excluded claims reporting an ICD–10–CM code for CNS disease. The applicant identified 390,328 cases spanning 722 MS–DRGs.

Dysphagia ICD-10-PCS Codes	Description
R13.10	Unspecified
R13.12	Oropharyngeal phase
R13.13	Pharyngeal phase
R13.14	Pharyngoesophageal phase
R13.19	Other dysphagia

CNS Disease ICD-10-CM Codes	Description
G10.x	Huntington's disease
G11.1x	Friedreich's ataxia
G12.x	Spinal muscular atrophy and related syndromes
G20.x	Parkinson's disease
G30xx	Alzheimer's disease
G31.83x	Lewy body disease
G35xx	Multiple sclerosis

Under both analyses, the applicant did not remove any charges for prior technology. The applicant standardized the charges and applied an inflation factor of 13.2 percent, or the 2-year inflation factor used to update the outlier threshold in the FY 2021 IPPS/LTCH final rule (85 FR 89039), to update the charges from FY 2019 to FY 2021. The applicant then added charges for the Phagenyx® System by dividing the cost by the national cost-to-charge ratio for supplies and equipment of 0.297 (85 FR 58601).

Under the analysis based on the applicant's Breakthrough Designation indication, the applicant calculated a final inflated case-weighted average standardized charge per case of $331,860 and an average case-weighted threshold of $276,624. Under the analysis based on the applicant's broader proposed indication, the applicant calculated a final inflated case-weighted average standardized charge per case of $104,346 and an average case-weighted threshold of $68,799. Because the final inflated case-weighted average standardized charge per case exceeded the average case-weighted threshold amount under both analyses, the applicant asserted that the technology meets the cost criterion.

We agree with the applicant that Phagenyx® System meets the cost criterion and therefore are proposing to approve Phagenyx® System for new technology add-on payments for FY 2022, subject to the technology receiving FDA marketing authorization for the indication corresponding to the Breakthrough Device designation by July 1, 2021. As noted previously, only the use of the Phagenyx® System for the treatment of neurogenic dysphagia in adult tracheotomized patients weaned from ventilation, and the FDA Breakthrough Device designation it received for that use, are relevant for purposes of the new technology add-on payment application for FY 2022.

Based on preliminary information from the applicant at the time of this proposed rule, the cost of the Phagenyx® System is $5,000. We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are proposing that the maximum new technology add-on payment for a case involving the use of the Phagenyx® System would be $3,250 for FY 2022 (that is, 65 percent of the average cost of the technology).

We are inviting public comments on whether the Phagenyx® System meets the cost criterion and our proposal to approve new technology add-on payments for the Phagenyx® System for FY 2022 for the indication corresponding to the Breakthrough Device designation, subject to the Phagenyx® System receiving FDA marketing authorization for that indication by July 1, 2021.

(10) PRCFC

Cerus Corporation submitted an application for new technology-add on payments for FY 2022. PRCFC (pathogen reduced cryoprecipitated fibrinogen complex) is a blood product indicated for the treatment for fibrinogen deficiency-related bleeding, including massive hemorrhage. Per the applicant, this blood product is useful in emergency departments and operating rooms due to its 5-day shelf life at room temperature. The applicant stated that the 5-day shelf life of the blood product makes it immediately available in a ready-to-transfuse form as a fibrinogen source and thereby provides a significant benefit for patients with massive hemorrhage in a real time-critical fashion that is not achievable with other existing fibrinogen replacement products.

PRCFC is designated as a Breakthrough Device, indicated for control of massive bleeding associated with fibrinogen (Fg) deficiency, and received FDA premarket approval (PMA) on November 24, 2020 for the following indications: (1) Treatment and control of bleeding, including massive hemorrhage, associated with fibrinogen deficiency; (2) control of bleeding when recombinant and/or specific virally inactivated preparations of factor XIII or von Willebrand factor (vWF) are not available; (3) second-line therapy for von Willebrand disease (vWD); and (4) control of uremic bleeding after other treatment modalities have failed. The applicant stated that the product will not be available for sale until the second quarter of CY 2021 due to manufacturing lead time for system components as well as validations and quality control analyses that must be completed by the manufacturing facilities. We note that, under the eligibility criteria for approval under the alternative pathway for certain

transformative new devices, only the use of PRCFC for the control of massive bleeding associated with fibrinogen (Fg) deficiency, and the FDA Breakthrough Device designation it received for that use, are relevant for purposes of the new technology add-on payment application for FY 2022.

According to the applicant, there are currently no unique ICD–10–PCS codes that accurately identify the transfusion of this product. The applicant stated while there are many ICD–10–PCS codes to describe the transfusion of traditional nonautologous plasma cryoprecipitate, these codes do not apply to this product. The applicant submitted a request to the ICD–10 Coordination and Maintenance Committee for approval of a unique code for FY 2022 to identify the technology.

With respect to the cost criterion, the applicant searched the FY 2019 MedPAR dataset for cases reporting an ICD–10–PCS procedure code for nonautologous plasma cryoprecipitate. The applicant identified 8,553 cases spanning over 369 MS–DRGs.

30230M1	Transfusion of nonautologous plasma cryoprecipitate into Peripheral vein, open approach
30233M1	Transfusion of nonautologous plasma cryoprecipitate into peripheral vein, percutaneous approach
30240M1	Transfusion of nonautologous plasma cryoprecipitate into central vein, open approach
30243M1	Transfusion of nonautologous plasma cryoprecipitate into Central vein, percutaneous approach
30250M1	Transfusion of nonautologous plasma cryoprecipitate into peripheral artery, open approach
30253M1	Transfusion of nonautologous plasma cryoprecipitate into peripheral artery, percutaneous approach
30260M1	Transfusion of nonautologous plasma cryoprecipitate into central artery, open approach
30263M1	Transfusion of nonautologous plasma cryoprecipitate into central artery, percutaneous approach
30273M1	Transfusion of nonautologous plasma cryoprecipitate into products of conception, circulatory, percutaneous approach
30277M1	Transfusion of nonautologous plasma cryoprecipitate into products of conception, circulatory, via natural or artificial open approach

Per the applicant, the top 5 MS–DRGs were 219 (Cardiac Valve and Other Major Cardiothoracic Procedures Without Cardiac Catheterization with MCC), 220 (Cardiac Valve and Other Major Cardiothoracic Procedures Without Cardiac Catheterization with CC), 871 (Septicemia or Severe Sepsis Without Mv >96 Hours with MCC), 003 (ECMO or Tracheostomy with Mv >96 Hours Or Principal Diagnosis Except Face, Mouth And Neck With Major O.R. Procedure), and 216 (Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC) and accounted for 34 percent of all cases. The applicant then removed charges for the technology being replaced. Per the applicant, PRCFC would replace the current nonautologous plasma cryoprecipitate billed with a blood revenue code. The applicant explained that it could not separate nonautologous plasma cryoprecipitate from other blood charges and therefore removed all charges from the blood department. The applicant then standardized the charges and applied the 2-year outlier inflation factor of 13.2 percent used to update the outlier threshold in the FY 2021 IPPS/LTCH final rule (85 FR 59039). To estimate the cost of the technology, the applicant multiplied the sale price of PRCFC by an average of 12.9 units of cryoprecipitate required per patient, which the applicant asserted as equivalent to 5.2 grams of fibrinogen based on a recent study in adult cardiac surgery patients with clinically significant bleeding and fibrinogen deficiency.[930] The applicant estimated an average per-patient cost of $3,900, which the applicant converted to charges using the national cost-to-charge ratio for blood and blood products (0.271) from the FY 2021 IPPS/LTCH PPS final rule (85 FR 58601). The applicant indicated that the outlier inflation factor was not applied to charges for PRCFC.

The applicant calculated a final inflated case-weighted average standardized charge per case of $299,895 and an average case-weighted threshold of $183,897. Because the final inflated case-weighted average standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the technology meets the cost criterion.

We agree with the applicant that PRCFC meets the cost criterion and therefore are proposing to approve PRCFC for new technology add-on payments for FY 2022 when used for the control of massive bleeding associated with fibrinogen (Fg) deficiency. Based on preliminary information from the applicant at the time of this proposed rule, the cost of PRCFC is $750 per gram × 5.2 grams for the amount of $3,900 per patient. We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are proposing that the maximum new technology add-on payment for a case involving the use of PRCFC would be $2,535 per patient for FY 2022 (that is, 65 percent of the average cost of the technology).

We are inviting public comments on whether PRCFC meets the cost criterion and our proposal to approve new technology add-on payments for PRCFC for FY 2022 when used for the control of massive bleeding associated with fibrinogen (Fg) deficiency.

(11) RECELL® Autologous Cell Harvesting Device

Avita Medical submitted an application for new technology-add on payments for RECELL® Autologous Cell Harvesting Device (RECELL®). The device is a standalone, single-use, battery-powered device used to process an autologous skin cell suspension for the treatment of acute thermal burn wounds. Per the applicant, the purpose of the device is to assist with harvesting a small graft from the patient's healthy skin and immediate processing into an autologous skin cell suspension which is then immediately applied to the patient's burn wound following surgical preparation of the acute thermal burn wound. The applicant describes the device components as including a mechanical scraping tray, wells for incubating the donor graft with a proprietary enzyme solution, a rinsing well, a cell strainer, a spray applicator as well as buttons for ''self-test'', and ''run.''

RECELL® was granted Expedited Access Pathway (EAP) by FDA (and is therefore considered part of the Breakthrough Devices Program by

[930] Callum J. et al. (2019). Effect of fibrinogen concentrate vs cryoprecipitate on blood component transfusion after cardiac surgery: The FIBRES randomized clinical trial. *JAMA, 322*(20), 1–11.

FDA [931]) on December 10, 2015 with the indication for use at the patient's point-of care for preparation of an autologous epithelial cell suspension to be applied to a prepared wound bed; under the supervision of a healthcare professional, the suspension is used to achieve epithelial regeneration for definitive closure of burn injuries, particularly in patients having limited availability of donor skin for autografting. RECELL® received FDA premarket approval (PMA) on September 20, 2018 with the indication for use listed as indicated for the treatment of acute thermal burn wounds in patients 18 years of age and older. Since the narrower indication for which the technology received PMA is included within the scope of the EAP indication, it appears that the PMA indication is appropriate for new technology add-on payment under the alternative pathway criteria. Per the applicant, RECELL® was available for sale upon FDA approval, albeit on a very limited basis primarily to burn centers involved with the clinical trials. According to the applicant, new ICD–10–PCS codes that are specific to RECELL® were created effective October 1, 2019. Per the applicant, the first three characters of these codes are ''0HR,'' followed by a fourth character signifying which body part is impacted, then ''X72'' for the final three characters.

With regard to the newness criterion, we believe that the beginning of the newness period for RECELL® commences from the date of approval by the FDA on September 20, 2018, as the applicant indicated the technology was available for sale from that date. Because the 3-year anniversary date of the entry of RECELL® onto the U.S. market (September 20, 2021) will occur in FY 2021, we do not believe that the device is eligible for new technology add on payments for FY 2022. Accordingly, we are proposing to disapprove RECELL® Autologous Cell Harvesting Device for new technology add on payments for FY 2022. We are inviting public comments on our proposal to disapprove new technology add-on payments for the RECELL Autologous Cell Harvesting Device for FY 2022, including on whether the technology meets the newness criterion.

We also present the applicant's analysis of the cost criterion for this application. With regard to the cost criterion, the applicant searched the FY 2019 MedPAR dataset for cases representing patients who may be eligible for treatment with RECELL®. The applicant noted that the FY 2019 MedPAR dataset did not contain the ICD–10–PCS code 0HR__X72 (Skin Replacement on the _____, Autologous Tissue Substitute, using Cell Suspension Technique) that identify RECELL® procedures because the code was first effective on October 1, 2019 after the closing date for the FY 2019 file. For purposes of this application, the applicant searched for cases reporting ICD–10–PCS codes 0HR_X73 (Skin Replacement on the _____, Autologous Tissue Substitute, Full Thickness) and 0HR__X74 (Skin Replacement on the _____, Autologous Tissue Substitute, Partial Thickness) which describe skin graft procedures used to treat burn injuries. The applicant highlighted the potential codes in between using the following table:

Character 1: O Medical and Surgical ***Character 2: H Skin and Breast*** ***Character 3: R Operation***			
Body Part	**Approach**	**Device**	**Qualifier**
0 Skin, Scalp 1 Skin, Face 2 Skin, Right Ear 3 Skin, Left Ear 4 Skin, Neck 5 Skin, Chest 6 Skin, Back 7 Skin, Abdomen 8 Skin, Buttock 9 Skin, Perineum A Skin, Inguinal B Skin, Right Upper Arm C Skin, Left Upper Arm D Skin, Right Lower Arm E Skin, Left Lower Arm F Skin, Right Hand G Skin, Left Hand H Skin, Right Upper Leg J Skin, Left Upper Leg K Skin, Right Lower Leg L Skin, Left Lower Leg M Skin, Right Foot N Skin, Left Foot	X External	7 Autologous Tissue Substitute	**2 Cell Suspension Technique** **3** Full Thickness **4** Partial Thickness

[931] *https://www.fda.gov/regulatory-information/search-fda-guidance-documents/breakthrough-devices-program.*

Per the applicant, skin grafts for burn diagnoses, including RECELL® procedures, are assigned to MS–DRGs 927, 928, and 929 in Major Diagnostic Category (MDC) 22 (Burns). No other MS–DRGs or MDCs were considered because RECELL® is only indicated for acute thermal burns. The applicant presented four analyses based on patient cases with increasingly conservative inputs to demonstrate that RECELL® meets the cost criterion. The applicant indicated that it varied the combination of the 2-year inflation factor from the FY 2021 IPPS/LTCH PPS final rule and charges for the new technology in each analysis.

For all four scenarios, the applicant calculated the average charge per case for each MS–DRG and then standardized the charges. The applicant did not remove any charges for the technology being replaced, as the applicant asserted that RECELL® is not replacing a technology. However, the applicant removed charges to account for a reduced length of stay because of utilizing RECELL®. The applicant applied the 2-year outlier inflation factor of 13.2 percent from the FY 2021 IPPS/LTCH PPS final rule (85 FR 59039), to update the charges from FY 2019 to FY 2021 for two analyses. To provide a conservative calculation, the applicant submitted two additional analyses that did not apply an inflation factor to standardized charges.

The applicant added charges for the new technology after dividing the cost of RECELL® by the national average cost-to-charge ratio for supplies and equipment (0.297). Per the applicant, the anticipated charges for RECELL® vary depending on the size and extent of the burn wound. The applicant noted that one RECELL® system covers up to 1,920 square centimeters of body surface area, which equals approximately 10 percent of the total body surface area (TBSA) of an average-sized adult. The applicant also noted the ICD–10–CM T21 diagnosis code category (Burn and corrosion of trunk) to describe the extent of a burn wound in 10 percent TBSA increments and provide an objective, claims-based index for the approximate number of RECELL® systems needed per patient. Per the applicant, more than one RECELL® system may be required to provide full coverage of the patient's burn wounds as indicated by the T31 diagnosis code category (Burns classified according to extent of body surface involved).

Burn Wound, % of Body Surface	Percent of Third-Degree Burn	ICD-10-CM Code	RECELL System Units Needed	Hospital Charge per Patient
Less than 10%	0-9%	T31.00XX	1	$25,252.53 ((1*$7,500)/0.297)
10% - 19%	0-9%	T31.10XX	2	$50,505.05 ((2*$7,500)/0.297)
	10-19%	T31.11XX	2	
20% - 29%	0-9%	T31.20XX	3	$75,757.58 ((3*$7,500)/0.297)
	10-19%	T31.21XX	3	
	20-29%	T31.22XX	3	
30% - 39%	0-9%	T31.30XX	4	$101,010.10 ((4*$7,500)/0.297)
	10-19%	T31.31XX	4	
	20-29%	T31.32XX	4	
	30-39%	T31.33XX	4	
40% - 50%	0-9%	T31.40XX	5	$126,262.63 ((5*$7,500)/0.297)
	10-19%	T31.41XX	5	
	20-29%	T31.42XX	5	
	30-39%	T31.43XX	5	
	40-49%	T31.44XX	5	
	50%	T31.50XX	5	

Under the first analysis, which involved a case with a 27 percent TBSA burn injury requiring three RECELL® systems and a 13.2 percent charge inflation factor, the applicant calculated a final inflated case-weighted average standardized charge per case of $268,119.

Under the second analysis, which involved the same case with a 27 percent TBSA burn injury requiring three RECELL® systems and no charge inflation factor, the applicant calculated a final inflated case-weighted average standardized charge per case of $245,824.

Under the third analysis, which involved a case with a 9 percent TBSA injury requiring one RECELL® system and a 13.2 percent charge inflation factor, the applicant calculated a final inflated case-weighted average standardized charge per case of $217,614.

Under the fourth analysis, which involved the same case with a 9 percent TBSA burn injury requiring one RECELL® system and no charge inflation factor, the applicant calculated a final inflated case-weighted average standardized charge per case of $195,319.

The applicant calculated a case-weighted threshold of $166,916 under all four analyses.

Because the final inflated case-weighted average standardized charge per case exceeded the average case-weighted threshold amount under all four analyses, the applicant asserted that the technology meets the cost criterion.

We agree with the applicant that RECELL® meets the cost criterion. As stated previously, because the 3-year anniversary date of the entry of RECELL® onto the U.S. market (September 20, 2021) will occur in FY

2021, we do not believe that the device is eligible for new technology add-on payments for FY 2022. Therefore, we are proposing to disapprove RECELL® for new technology add-on payments for FY 2022. However, in the event we receive updated information to establish that RECELL® meets the newness criterion, we are providing the following information regarding the new technology add-on payment amount.

Based on preliminary information from the applicant at the time of this proposed rule, the cost per patient of RECELL® is $15,000 or an estimated average cost of $7,500 per device multiplied by 2, which, per the applicant, is the average number of RECELL® units used per procedure. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. In the event we receive supplemental information to establish that the technology is still within the newness period, and we were to approve new technology add-on payments for RECELL® in the final rule, the maximum new technology add-on payment for RECELL® would be $9,570 for FY 2022 (that is, 65 percent of the average cost of the technology).

(12) Shockwave C2 Intravascular Lithotripsy (IVL) System

Shockwave Medical Inc. submitted an application for new technology-add on payments for Shockwave C2 Intravascular Lithotripsy (IVL) System for FY 2022. Per the applicant, the IVL Catheter is intended for lithotripsy-enabled, low-pressure dilation of calcified, stenotic de novo coronary arteries prior to stenting. The applicant explained that the device is delivered through the coronary arterial system, and it generates intermittent sonic waves within the target treatment site that disrupt calcium within the lesion, allowing subsequent dilation of a coronary artery stenosis using low balloon pressure. The applicant also noted that the procedure can be used for otherwise difficult to treat calcified stenosis, including calcified stenosis that are anticipated to exhibit resistance to full balloon dilation or subsequent uniform coronary stent expansion.

Shockwave C2 Intravascular Lithotripsy (IVL) System was designated as a Breakthrough Device in August 2019, indicated for lithotripsy-enabled, low-pressure dilation of calcified, stenotic de novo coronary arteries prior to stenting. The applicant stated that it anticipates receiving Pre-Market Approval as a Class III device from the FDA by March 2021 for the same proposed indication. The applicant stated that they expect to be shipping product within 1 month of FDA approval and state that they therefore estimate market availability by April 2021. According to the applicant, there are currently no unique ICD–10–PCS codes describing the device. The applicant has submitted a request to the ICD–10 Coordination and Maintenance Committee for approval of a unique code for FY 2022 to identify the technology.

With regard to the cost criterion, the applicant conducted two analyses based on 100 percent of identified claims and 81 percent of identified claims. To identify potential cases where Coronary IVL could be utilized, the applicant searched the FY 2019 MedPAR file for ICD–10–PCS codes for the placement of a coronary stent, consistent with the anticipated FDA indication for Shockwave C2 Intravascular Lithotripsy (IVL). The applicant included all codes beginning with ''027'' and ending with ''6'' or ''Z'' in its search. The applicant highlighted the potential codes in between using the table that follows:

Section: 0 Medical and Surgical *Body System: 2 Heart and Great Vessels* *Operation: 7 Dilation: expanding an orifice or the lumen of a tubular body part*			
Body Part	**Approach**	**Device**	**Qualifier**
0 Coronary Artery, One Artery **1 Coronary Artery, Two Arteries** **2 Coronary Artery, Three Arteries** **3 Coronary Artery, Four or More Arteries**	0 Open **3 Percutaneous** 4 Percutaneous Endoscopic	**4 Intraluminal Device, Drug-eluting** **5 Intraluminal Device, Drug-eluting, Two** **6 Intraluminal Device, Drug-eluting, Three** **7 Intraluminal Device, Drug-eluting, Four or More** **D Intraluminal Device** **E Intraluminal Device, Two** **F Intraluminal Device, Three** **G Intraluminal Device, Four or More** T Intraluminal Device, Radioactive Z No Device	**8 Bifurcation** **9** Z No Qualifier

For the analysis using 100 percent of cases, the applicant identified 160,901 cases mapping to 209 MS–DRGs. Per the applicant, Shockwave C2 Intravascular Lithotripsy (IVL) does not replace any current devices used for indicated patients. However, to be conservative, the applicant removed 50 percent of charges associated with revenue center 0278—other implants. The applicant then standardized the charges and applied the 2-year outlier inflation factor of 13.2 percent used to update the outlier threshold in the FY 2021 IPPS/LTCH final rule (85 FR 59039), to update the charges from FY 2019 to FY 2021. The applicant added charges for the new technology by multiplying the cost of the technology by the estimated number of devices per patient and then dividing by the national CCR for implantable devices (0.293) from the FY 2021 IPPS/LTCH PPS final rule. Under the analysis based on 100 percent of identified claims, the applicant calculated a final inflated case-weighted average standardized charge per case of $143,805 and an average case-weighted threshold of $115,693.

For the analysis using 81 percent of cases, the applicant identified 130,907 cases mapping to MS–DRGs 246 and 247. The applicant conducted the same analysis noted previously and determined a final inflated case-weighted average standardized charge per case of $122,020 and an average case-weighted threshold of $104,783. Because the final inflated case-weighted average standardized charge per case exceeded the average case-weighted threshold amount under both analyses, the applicant asserted that the technology meets the cost criterion.

We agree with the applicant that Shockwave C2 Intravascular Lithotripsy (IVL) System meets the cost criterion and therefore are proposing to approve Shockwave C2 Intravascular Lithotripsy (IVL) System for new technology add on payments for FY 2022, subject to the technology receiving FDA marketing authorization for lithotripsy-enabled, low-pressure dilation of calcified, stenotic de novo coronary arteries prior to stenting by July 1, 2021.

Based on preliminary information from the applicant at the time of this proposed rule, the cost of the Shockwave C2 Intravascular Lithotripsy (IVL) System is $4,700 per device x 1.2 devices required per case for an amount of $5,640. We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are proposing that the maximum new technology add-on payment for a case involving the use of the Shockwave C2 Intravascular Lithotripsy (IVL) System would be $3,666 for FY 2022 (that is, 65 percent of the average cost of the technology).

We are inviting public comments on whether the Shockwave C2 Intravascular Lithotripsy (IVL) System meets the cost criterion and our proposal to approve new technology add-on payments for the Shockwave C2 Intravascular Lithotripsy (IVL) System for FY 2022, subject to Shockwave C2 Intravascular Lithotripsy (IVL) System receiving FDA marketing authorization by July 1, 2021 for lithotripsy-enabled, low-pressure dilation of calcified, stenotic de novo coronary arteries prior to stenting.

(13) Thoraflex™ Hybrid Device

Terumo Aortic submitted an application for new technology-add on payments for the Thoraflex™ Hybrid Device (Thoraflex™) for FY 2022. Per the applicant, the device is a sterile single-use, gelatin sealed Frozen Elephant Trunk (FET) surgical medical device. The applicant explained that the device is deployed through an opened aortic arch and then positioned into the descending thoracic aorta. The applicant further explained that, once it is completely deployed, the collar is sutured to the aorta, and graft anastomoses are then performed in a manner depending upon the chosen product design (which the applicant specified as either the Plexus or the Ante-Flo). The device includes a proximal crimped polyester surgical graft, central polyester collar, and distal nitinol ring stents supported by thin-wall polyester fabric. The applicant also noted that the device has a unique gelatin sealant that acts as a seal, preventing blood loss through the polyester fabric product wall.

Thoraflex™ Hybrid Device received Breakthrough Device designation on March 20, 2020 with an indication for the open surgical repair or replacement of damaged or diseased vessels of the aortic arch and descending aorta, with or without involvement of the ascending aorta, in cases of aneurysm and/or dissection. The applicant is seeking Pre-Market Approval for the device under a Class III device designation. The applicant stated there are currently no unique ICD–10–PCS codes that describe the Thoraflex™ Hybrid Device, but the following codes may be currently utilized: 02RX08Z (Replacement of thoracic aorta, ascending/arch with zooplastic tissue, open approach); 02RX0JZ (Replacement of thoracic aorta, ascending/arch with synthetic tissue, open approach); and 02RX0KZ (Replacement of thoracic aorta, ascending/arch with nonautologous tissue substitute, open approach). The applicant submitted a request to the ICD–10 Coordination and Maintenance Committee for approval of a unique code for FY 2022 to identify the technology.

With regard to the cost criterion, the applicant conducted two analyses based on 100 percent of identified claims and 74 percent of identified claims. To identify potential cases where the Thoraflex™ Hybrid Device could be utilized, the applicant searched the FY 2019 MedPAR file for claims reporting the ICD–10–PCS codes for thoracic aortic replacement procedures noted previously. For the analysis using 100 percent of cases, the applicant identified 5,374 cases mapping to 21 MS–DRGs. The applicant then removed charges for the technology being replaced. Per the applicant, the use of the Thoraflex™ Hybrid device is expected to replace a portion of prior technologies. The applicant explained that because an estimate of the percentage of these total charges that would be replaced could not be determined, it removed 100 percent of charges associated with medical/surgical supplies and devices (revenue centers 027x and 0624). The applicant then standardized the charges and applied the 2-year outlier inflation factor of 13.2 percent used to update the outlier threshold in the FY 2021 IPPS/LTCH PPS final rule (85 FR 59039), to update the charges from FY 2019 to FY 2021. As the average sales price of the Thoraflex™ has yet to be determined, the applicant did not add charges for the new technology. The applicant indicated that, once the price is determined, it will utilize the national cost-to-charge ratio for implantable devices from the FY 2021 IPPS/LTCH PPS final rule (0.293) to calculate estimated average hospital charges associated with the device. Under this analysis, based on 100 percent of identified claims, the applicant calculated a final inflated case-weighted average standardized charge per case of $298,047 and an average case-weighted threshold of $230,079.

Under the analysis based on 74 percent of cases, the applicant used the same methodology, which identified 3,978 cases across MS–DRGs 219 and 220. The applicant determined the average case-weighted threshold of $210,585 and a final inflated average standardized charge per case of $254,795. Because the final inflated case-weighted average standardized charge per case exceeded the average case-weighted threshold amount under both analyses, the applicant asserted that the technology meets the cost criterion.

We agree with the applicant that the Thoraflex™ Hybrid Device meets the cost criterion and therefore are proposing to approve the Thoraflex™ Hybrid Device for new technology add-on payments for FY 2022, subject to the technology receiving FDA marketing authorization for the open surgical repair or replacement of damaged or diseased vessels of the aortic arch and descending aorta, with or without involvement of the ascending aorta, in cases of aneurysm and/or dissection by July 1, 2021.

The applicant has not provided an estimate for the cost of the Thoraflex™ Hybrid Device at the time of this proposed rule. We expect the applicant to submit cost information prior to the final rule, and we will provide an update regarding the new technology add-on payment amount for the technology, if approved, in the final rule. Any new technology add on payment for the Thoraflex™ Hybrid Device would be subject to our policy under § 412.88(a)(2) where we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case.

We are inviting public comments on whether the Thoraflex™ Hybrid Device meets the cost criterion and our proposal to approve new technology add-on payments for the Thoraflex™ Hybrid Device for FY 2022, subject to Thoraflex™ Hybrid Device receiving FDA marketing authorization by July 1, 2021 for the open surgical repair or replacement of damaged or diseased vessels of the aortic arch and descending aorta, with or without involvement of the ascending aorta, in cases of aneurysm and/or dissection.

b. Alternative Pathways for Qualified Infectious Disease Products (QIDPs)

(1) CONTEPO™ (fosfomycin)

Nabriva Therapeutics US, Inc. submitted an application for new technology-add on payments for CONTEPO™ (fosfomycin) for FY 2022. CONTEPO™ is an intravenously administered epoxide antibiotic intended for the treatment of complicated urinary tract infections (cUTI) including acute pyelonephritis (AP) caused by designated susceptible bacteria. Per the applicant, the drug inhibits cell wall synthesis at an earlier stage and provides new treatment for patients with cUTIs including acute pyelonephritis caused by *Escherichia coli* and *Klebsiella pneumonia* that have failed to respond to other first-line therapies.

CONTEPO™ is designated as a QIDP. The applicant initially applied for FDA approval when submitting a New Drug Application (NDA) in October 2018 seeking marketing approval of IV fosfomycin for injection (ZTI–01) for the treatment of patients 18 years and older with cUTI including acute pyelonephritis caused by designated susceptible bacteria. According to the applicant, on June 19, 2020, the FDA rejected the applicant's resubmitted NDA due to unresolved manufacturing issues that required an in-person inspection, which the FDA was not able to conduct due to travel restrictions. The applicant plans to resubmit an NDA

after discussing next steps with the FDA and hopes to receive FDA approval prior to July 1, 2021.

The applicant previously applied for a new technology add-on payment for the same indication for FY 2021 and received conditional approval for new technology add-on payments for FY 2021, subject to CONTEPO™ receiving FDA marketing authorization before July 1, 2021 (85 FR 58724). If CONTEPO™ receives FDA marketing authorization before July 1, 2021, the new technology add-on payment for cases involving the use of this technology would be made effective for discharges beginning in the first quarter after FDA marketing authorization is granted. If the FDA marketing authorization is received on or after July 1, 2021, no new technology add-on payments will be made for cases involving the use of CONTEPO™ for FY 2021.

If CONTEPO™ receives FDA marketing authorization before July 1, 2021, the applicant has indicated that it would withdraw its application for FY 2022 and would instead seek new technology add-on payments for CONTEPO™ for FY 2022 as a continuation of the conditional approval for FY 2021. The applicant requested in its application for FY 2022 that if the technology does not receive FDA marketing authorization by July 1, 2021, CMS conditionally approve CONTEPO™ for new technology add-on payments for FY 2022.

The applicant applied for and received a unique ICD–10–PCS procedure code to identify cases involving the administration of CONTEPO™ in 2019. Effective October 1, 2019, CONTEPO™ administration can be identified by ICD–10–PCS procedure codes XW033K5 (Introduction of fosfomycin anti-infective into peripheral vein, percutaneous approach, new technology group 5) and XW043K5 (Introduction of fosfomycin anti-infective into central vein, percutaneous approach, new technology group 5), which the applicant states are unique to CONTEPO™ administration.

With regard to the cost criterion, the applicant used the FY 2019 MedPAR Limited Data Set (LDS) to assess the MS–DRGs to which potential cases representing hospitalized patients who may be eligible for treatment involving CONTEPO™ would most likely be mapped. According to the applicant, CONTEPO™ is anticipated to be indicated for the treatment of hospitalized patients who have been diagnosed with complicated urinary tract infections (cUTIs). The applicant identified 199 ICD–10–CM diagnosis code combinations that identify hospitalized patients who have been diagnosed with a cUTI. Searching the FY 2019 MedPAR data file for these ICD–10–CM diagnosis codes resulted in a total of 525,876 potential cases that span 507 unique MS–DRGs. The applicant noted that the cases identified are fewer than in the FY 2021 new technology add-on payment application. Per the applicant, this change occurred because the applicant excluded additional claims for Medicare Advantage and inpatient ''full-encounter'' claims from all cohorts. The applicant maintained that while cohorts are smaller, the effects on the results were minimal.

The applicant examined associated charges per MS–DRG and removed charges for potential antibiotics that may be replaced by the use of CONTEPO™. Specifically, the applicant identified 5 antibiotics currently used for the treatment of patients who have been diagnosed with a cUTI and calculated the cost of each of these drugs for administration over 14-day inpatient hospitalization. Because patients who have been diagnosed with a cUTI would typically only be treated with one of these antibiotics at a time, the applicant estimated an average of the 14-day cost for the 5 antibiotics. The applicant then converted the cost to charges by dividing the costs by the national average CCR of 0.187 for drugs from the FY 2021 IPPS/LTCH PPS final rule (85 FR 58601). The applicant then standardized the charges for each case and inflated each case's charges by applying the FY 2021 IPPS/LTCH PPS final rule outlier charge inflation factor of 13.2 percent (85 FR 59039).

The applicant then added the charges for the new technology by calculating the per-day cost per patient. The applicant noted that the duration of therapy of up to 14 days (patients that had a cUTI with concurrent bacteremia) is consistent with the prospective prescribing information, and that it used this 14-day duration of therapy to calculate total inpatient cost. The applicant then converted these costs to charges by dividing the costs per patient by the national average cost-to charge ratio of 0.187 for drugs from the FY 2021 IPPS/LTCH PPS final rule (85 FR 58601). The applicant calculated a final inflated case-weighted average standardized charge per case of $79,619 and a case weighted threshold of $59,237. Because the final inflated case-weighted average standardized charge per case for CONTEPO™ exceeded the average case-weighted threshold amount, the applicant maintained it meets the cost criterion.

As summarized, the applicant used a 14-day duration of therapy to calculate total inpatient cost for purposes of its cost analysis. However, the applicant noted that the average number of days a patient would be administered CONTEPO™ will most likely fall between 10 to 14 days of therapy given the current guideline recommendations. Of these treatment days, the applicant noted that nearly all would occur during the inpatient hospital stay. Consistent with our historical practice, and as stated in the FY 2021 IPPS/LTCH PPS final rule, we believe the new technology add-on payment for CONTEPO™, if approved, would be based on the average cost of the technology and not the maximum (85 FR 58724). Without further information from the applicant regarding the average number of days CONTEPO™ is administered, we continue to believe using the middle ground of 12.5 days, based on the 10–14 day period indicated by the applicant, is appropriate for this analysis to determine the average number of days CONTEPO™ is administered in the hospital. To assess whether the technology would meet the cost criterion using an average cost for the technology based on this 12.5-day period for CONTEPO™ administration, we converted the costs to charges by dividing the costs per patient by the national average cost-to charge ratio of 0.187 for drugs from the FY 2021 IPPS/LTCH PPS final rule (85 FR 58601). Based on data from the applicant, this resulted in a final inflated average case-weighted standardized charge per case of $77,613, which exceeds the case weighted threshold of $59,237.

Because of the large number of cases included in this cost analysis, the applicant supplemented the analysis as described previously with additional sensitivity analyses. In these analyses, the previous cost analysis was repeated using only the top 75 percent of cases and the top 20 MS–DRGs. In these two additional sensitivity analyses, the final inflated case-weighted average standardized charge per case for CONTEPO™ of $70,718 and $70,046 exceeded the average case-weighted threshold amount of $55,388 and $55,468, respectively. Because the final inflated case-weighted average standardized charge per case for CONTEPO™ exceeded the average case-weighted threshold amount, the applicant asserts that CONTEPO™ meets the cost criterion.

We agree with the applicant that CONTEPO™ (fosfomycin) meets the cost criterion.

Therefore, if CONTEPO™ does not receive FDA approval by July 1, 2021 to

receive new technology add on payments beginning with FY 2021, for FY 2022, per the policy finalized in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58739 through 58742), we are proposing to conditionally approve CONTEPO™ for new technology add-on payments, subject to the technology receiving FDA marketing authorization by July 1, 2022 (that is, by July 1 of the fiscal year for which the applicant applied for new technology add-on payments (2022)). If CONTEPO™ receives FDA marketing authorization before July 1, 2022, the new technology add-on payment for cases involving the use of this technology would be made effective for discharges beginning in the first quarter after FDA marketing authorization is granted. If the FDA marketing authorization is received on or after July 1, 2022, no new technology add-on payments would be made for cases involving the use of CONTEPO™ for FY 2022. As previously noted, the applicant has received a unique ICD–10–PCS procedure code to identify cases involving the administration of CONTEPO™. If CONTEPO™ receives FDA marketing authorization prior to July 1, 2021, we are proposing to continue making new technology add-on payments for CONTEPO™ in FY 2022.

As discussed previously, without further information from the applicant regarding the average number of days CONTEPO™ is administered, and consistent with our approach for the FY 2021 IPPS/LTCH PPS final rule, we believe using a 12.5-day duration of therapy is a reasonable approach for estimating the average cost of the technology. Based on preliminary information from the applicant at the time of this proposed rule, the cost of CONTEPO™ administered over 12.5 days is $3,500. We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments for QIDPs to the lesser of 75 percent of the average cost of the technology, or 75 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are proposing that if CONTEPO™ receives FDA marketing authorization prior to July 1, 2022, the maximum new technology add-on payment for a case involving the use of CONTEPO™ (fosfomycin) would be $2,625 for FY 2022 (that is, 75 percent of the average cost of the technology). Cases involving the use of CONTEPO™ that would be eligible for new technology add-on payments will be identified by ICD–10–PCS procedure codes XW033K5 (Introduction of Fosfomycin anti-infective into peripheral vein, percutaneous approach, new technology group 5) or XW043K5 (Introduction of Fosfomycin antiinfective into central vein, percutaneous approach, new technology group 5).

We are inviting public comments on whether CONTEPO™ (fosfomycin) meets the cost criterion and our proposal to approve new technology add-on payments for CONTEPO™ (fosfomycin) for FY 2022.

(2) FETROJA® (cefiderocol)

Shionogi & Co., Ltd submitted an application for new technology-add on payments for FETROJA® (cefiderocol) for FY 2022. FETROJA® is an injectable siderophore cephalosporin indicated for the treatment of hospital-acquired bacterial pneumonia (HABP)/ventilator-associated bacterial pneumonia (VABP) on September 25, 2020. Per the applicant, FETROJA® should be used to treat infections where limited or no alternative treatment options are available and where FETROJA® (cefiderocol) is likely to be an appropriate treatment option, which may include use in patients with infections caused by documented or highly suspected carbapenem-resistant and/or multidrug-resistant gram-negative (GN) pathogens. The applicant asserts that the principal antibacterial/bactericidal activity of FETROJA® occurs with inhibiting GN bacterial cell wall synthesis by binding to penicillin-binding proteins.

FETROJA® was designated as a QIDP for HABP/VABP and received FDA marketing approval for this indication on September 25, 2020. FETROJA® became available on the market for the treatment of HABP/VABP after FDA approval for this indication. FETROJA® also has a QIDP designation and is FDA approved for cUTI, and was granted a new technology add-on payment under the alternative new technology add-on payment pathway for certain antimicrobials for this indication in the FY 2021 IPPS/LTCH final rule (85 FR 58721). The current new technology add-on payment application for FY2022 is specific to the indication of HABP/VABP. According to the applicant, the ICD–10 Coordination and Maintenance Committee approved the following ICD–10–PCS codes to specifically describe the IV administration of FETROJA, effective October 1, 2020: XW033A6 (Introduction of cefiderocol anti-infective into peripheral vein, percutaneous approach, new technology group 6) and XW043A6 (Introduction of cefiderocol anti-infective into central vein, percutaneous approach, new technology group 6).

With regard to the cost criterion, the applicant conducted two analyses based on 100 percent and 75 percent of identified claims. For both scenarios, the applicant used the FY 2019 MedPAR Limited Data Set (LDS) to assess the MS–DRGs to which potential cases representing hospitalized patients who may be eligible for FETROJA® treatment would be mapped. The applicant identified eligible cases by searching the FY 2019 MedPAR for cases reporting ICD–10–CM codes for pneumonia and for resistance to antimicrobial drugs.

Under the first scenario of 100 percent of cases, the applicant identified 9,595 cases mapping to 203 MS–DRGs. Under the second scenario of 75 percent of cases, the applicant identified 7,218 cases mapping to 19 MS–DRGs. The applicant standardized the charges after calculating the average case-weighted unstandardized charge per case for both scenarios and removing 50 percent of charges associated with the drug revenue centers 025x, 026x, and 063x under both scenarios. Per the applicant, FETROJA® is expected to replace some of the drugs that would otherwise be utilized to treat these patients. The applicant stated that it believes 50 percent of these total charges to be a conservative estimate as other drugs will still be required for these patients during their hospital stay. The applicant then applied an inflation factor of 13.2 percent, which was the 2-year outlier charge inflation factor used in the FY 2021 IPPS/LTCH PPS final rule (85 FR 59039), to update the charges from FY 2019 to FY 2021. The applicant then added charges for FETROJA® by dividing the total average hospital cost of FETROJA® by the national average cost-to-charge ratio (0.187) for drugs published in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58601).

The applicant calculated a final inflated case-weighted average standardized charge per case of $164,825 for the first scenario and $148,821 for the second scenario and an average case-weighted threshold amount of $78,296 for the first scenario and $73,607 for the second scenario. Because the final inflated case-weighted average standardized charge per case for each scenario exceeds the average case-weighted threshold amount for each scenario, the applicant asserted that the technology meets the cost criterion.

We agree with the applicant that FETROJA® (cefiderocol) meets the cost criterion and therefore are proposing to approve FETROJA® for new technology

add on payments for FY 2022 when used for the treatment of HABP/VABP. Cases involving the use of FETROJA® that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure codes XW03366 or XW04366.

Based on preliminary information from the applicant at the time of this proposed rule, the cost of FETROJA® administered over an average of 10.4 days is $11,439.79. We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments for QIDPs to the lesser of 75 percent of the average cost of the technology, or 75 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are proposing that the maximum new technology add-on payment for a case involving the use of FETROJA® when used for the treatment of HABP/VABP would be $8,579.84 for FY 2022 (that is, 75 percent of the average cost of the technology).

We are inviting public comments on whether FETROJA® (cefiderocol) meets the cost criterion and our proposal to approve new technology add-on payments for FETROJA® for FY 2022 for the treatment of HABP/VABP.

(3) RECARBRIO™ (imipenem, cilastatin, and relebactam)

Merck & Co. submitted an application for new technology add-on payments for RECARBRIO™ for FY 2022. RECARBRIO™ is a fixed-dose combination of imipenem, a penem antibacterial; cilastatin, a renal dehydropeptidase inhibitor; and relebactam, a novel b-lactamase inhibitor (BLI) administered via intravenous infusion. Per the applicant, RECARBRIO™ is indicated for the treatment of hospital-acquired bacterial pneumonia (HABP) and ventilator-associated bacterial pneumonia (VABP) caused by susceptible Gram-negative bacteria. RECARBRIO™ is also indicated for complicated urinary tract infections (cUTI) and complicated intra-abdominal infections (cIAI) and was approved for new technology add-on payment for these indications in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58728).

The applicant explained that the recommended dose of RECARBRIO™ is 1.25 grams administered by intravenous infusion over 30 minutes every 6 hours in patients 18 years of age and older with creatinine clearance (CrCl) 90 mL/min or greater. Per the applicant, the recommended treatment course suggests that a patient will receive 1 vial per dose and 4 doses per day. Per RECARBRIO™'s prescribing information, the recommended duration of treatment is 4 days to 14 days.

RECARBRIO™ is designated as a QIDP indicated for the treatment of HABP/VABP and received FDA approval through a supplemental NDA on June 4, 2020 for this indication. According to the applicant, RECARBRIO™ originally submitted an NDA for the cUTI and cIAI indications and received FDA approval on July 16, 2019. The applicant previously applied for the new technology add-on payment for the cUTI and cIAI indications, which CMS approved in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58728). The application for new technology add-on payments for FY 2022 is specific to the HABP and VABP indications. The applicant noted that RECARBRIO™ can be identified with ICD–10–PCS codes XW033U5 (Introduction of imipenem-cilastatin-relebactam anti-infective into peripheral vein, percutaneous approach, new technology group 5) or XW043U5 (Introduction of imipenem-cilastatin-relebactam anti-infective into central vein, percutaneous approach, new technology group 5).

To demonstrate that the technology meets the cost criterion, the applicant searched the FY 2019 MedPAR Limited Data Set (LDS) for cases reporting ICD–10–CM diagnosis code J95.851(Ventilator assisted pneumonia) for VABP, and the following list of codes for HABP:

Group	Code	Code Type	Description
Group 1	J181	ICD-10-CM Diagnosis Code	Lobar pneumonia, unspecified organism
Group 1	J150	ICD-10-CM Diagnosis Code	Pneumonia due to Klebsiella pneumoniae
Group 1	J151	ICD-10-CM Diagnosis Code	Pneumonia due to Pseudomonas
Group 1	J14	ICD-10-CM Diagnosis Code	Pneumonia due to Hemophilus influenzae
Group 1	J158	ICD-10-CM Diagnosis Code	Pneumonia due to other specified bacteria
Group 1	J155	ICD-10-CM Diagnosis Code	Pneumonia due to Escherichia coli
Group 1	J156	ICD-10-CM Diagnosis Code	Pneumonia due to other aerobic Gram-negative bacteria
Group 1	J158	ICD-10-CM Diagnosis Code	Pneumonia due to other specified bacteria
Group 1	J159	ICD-10-CM Diagnosis Code	Unspecified bacterial pneumonia
Group 1	J168	ICD-10-CM Diagnosis Code	Pneumonia due to other specified infectious organisms
Group 1	J17	ICD-10-CM Diagnosis Code	Pneumonia in diseases classified elsewhere
Group 1	J180	ICD-10-CM Diagnosis Code	Bronchopneumonia, unspecified organism
Group 1	J189	ICD-10-CM Diagnosis Code	Pneumonia, unspecified organism
Group 1	J9600	ICD-10-CM Diagnosis Code	Acute respiratory failure, unspecified whether with hypoxia or hypercapnia
Group 1	J9690	ICD-10-CM Diagnosis Code	Respiratory failure, unspecified, whether with hypoxia or hypercapnia
Group 1	J9620	ICD-10-CM Diagnosis Code	Acute and chronic respiratory failure

Additionally, for HABP, the applicant identified cases that included present on admission indicators of N (Diagnosis was not present at time of inpatient admission), U (Documentation insufficient to determine if condition was present at the time of inpatient admission), W (Clinically undetermined), or 1 (Unreported/not used).

The applicant identified a total 106,964 cases, which were mapped to 355 unique MS–DRGs. The applicant removed 88 MS–DRGs with minimal frequencies (fewer than 11 cases), leaving 106,655 cases mapping to 267 MS–DRGs. Per the applicant, the top 10 MS–DRGs covered approximately 34.1 percent of all patients. The applicant examined associated charges per MS–DRG and removed all pharmacy charges to be replaced using RECARBRIO™. The applicant then standardized and inflated the charges by applying the FY 2021 IPPS/LTCH PPS final rule outlier

charge inflation factor of 1.13218 (85 FR 59039).

The applicant estimated an average cost of RECARBRIO™ for the treatment of HABP and VABP in the inpatient setting based on the recommended dose of 1.25 grams (imipenem 500 mg, cilastatin 500 mg, relebactam 250 mg) administered by intravenous infusion over 30 minutes every 6 hours in patients 18 years of age and older with creatinine clearance (CLcr) 90 mL/min or greater. As stated previously, according to the applicant, the recommended treatment course suggests that a patient will receive 1 vial per dose, 4 doses per day within a recommended treatment duration of 4 to 14 days. To determine the cost per patient, the applicant stated it used the FY 2019 MedPAR analysis of total cases representing hospitalized patients who may be eligible for treatment involving RECARBRIO™ to identify a percentage of total cases per indication: HABP 94.07 percent of cases and VABP 5.93 percent. According to the applicant, it next identified the average length of stay per indication: HABP 14.2 days and VABP 24.2 days. The applicant also assumed that 70 percent of patients would receive RECARBRIO™ beginning on the fourth day after admission while the remaining 30 percent of these patients would receive RECARBRIO™ beginning on the second day of their hospitalization. The applicant then multiplied the daily dose cost by the two scenarios for each HABP and VABP indication to determine the cost per stay for each indication by days of drug use. Next it multiplied the cost per stay for each indication by the share of cases by days in use (70/30 percent split) to determine the weighted cost for days in use estimation. The applicant then summed the 70/30 percent case breakdown (weighted cost) for patients initiating on day 2 and 4 to determine the average cost per indication for HABP and VABP. Finally, the applicant multiplied the average cost per indication by the percent of total cases for HABP and VABP, then summed them to get the overall average cost. The applicant converted this cost to a charge by dividing the costs by the national average cost-to-charge ratio of 0.187 for drugs published in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58601) and added the resulting charges to determine the final inflated case-weighted average standardized charge per case.

The applicant calculated a final inflated case-weighted average standardized charge per case of $258,946 and an average case-weighted threshold amount of $123,172. The applicant also calculated an average case-weighted standardized charge per case for HABP and VABP separately using the same methodology previously described and determined final inflated case-weighted average standardized charges per case of $249,992 for HABP and $394,992 for VABP and average case-weighted thresholds of $117,466 for HABP and $214,869 for VABP.

In addition, because RECARBRIO™ was previously approved for a new technology add-on payment for the cUTI and cIAI indications, the applicant modified the added amount of the charge for RECARBRIO™ based on the cost calculation of the technology using all four indications. Using the same methodology previously described, the applicant determined final inflated case-weighted average standardized charges per case of $250,209 for HABP and VABP, $241,255 for HABP, and $386,255 for VABP and average case-weighted thresholds of $123,172 for HABP and VABP, $117,466 for HABP, and $214,869 for VABP. Because the final inflated case-weighted average standardized charge per case exceeded the average case-weighted threshold amount in each scenario, the applicant maintained that the technology met the cost criterion.

We agree with the applicant that RECARBRIO™ meets the cost criterion and therefore are proposing to approve RECARBRIO™ for new technology add on payments for FY 2022 when used for treatment of HABP and VABP. Based on preliminary information from the applicant at the time of this proposed rule, the cost of RECARBRIO™ is $12,768.68 when used for the treatment of HABP and VABP. We note that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments for QIDPs to the lesser of 75 percent of the costs of the new medical service or technology, or 75 percent of the amount by which the costs of the case exceed the MS–DRG payment. As a result, we are proposing that the maximum new technology add-on payment for a case involving the use of RECARBRIO™ would be $9,576.51 for FY 2022 (that is, 75 percent of the average cost of the technology) when used for treatment of HABP and VABP.

We are inviting public comments on whether RECARBRIO™ (imipenem, cilastatin, and relebactam) meets the cost criterion and our proposal to approve new technology add-on payments for the RECARBRIO™ (imipenem, cilastatin, and relebactam) for the indications of HABP and VABP for FY 2022.

7. Comment Solicitation on the New Technology Add-On Payment Newness Period for Products Available Through an Emergency Use Authorization (EUA) for COVID–19

As noted previously, and explained in the FY 2005 IPPS final rule (69 FR 49002), the intent of section 1886(d)(5)(K) of the Act and regulations under § 412.87(b)(2) is to pay for new medical services and technologies for the first 2 to 3 years that a product comes on the market, during the period when the costs of the new technology are not yet fully reflected in the DRG weights.

As we have discussed in prior rulemaking (77 FR 53348), generally, our policy is to begin the newness period on the date of FDA approval or clearance or, if later, the date of availability of the product on the U.S. market, when data reflecting the costs of the technology begin to become available for recalibration of the DRGs. In some specific circumstances, we have recognized a date later than FDA approval as the appropriate starting point for the 2-year to 3-year newness period for new technologies approved for add-on payments (85 FR 58734).

As discussed previously, in the FY 2009 IPPS final rule (73 FR 48561 through 48563), we revised our regulations at § 412.87 to codify our longstanding practice of how CMS evaluates the eligibility criteria for new medical service or technology add-on payment applications. We stated that new technologies that have not received FDA approval do not meet the newness criterion. In addition, we stated we do not believe it is appropriate for CMS to determine whether a medical service or technology represents a substantial clinical improvement over existing technologies before the FDA makes a determination as to whether the medical service or technology is safe and effective. For these reasons, we first determine whether a new technology meets the newness criterion, and only if so, do we make a determination as to whether the technology meets the cost threshold and represents a substantial clinical improvement over existing medical services or technologies. We also finalized at 42 CFR 412.87(c) (subsequently redesignated as 412.87(e)) that all applicants for new technology add-on payments must have FDA approval or clearance by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered.

In the FY 2021 IPPS/LTCH PPS final rule, to more precisely describe the various types of FDA approvals, clearances, licensures, and classifications that we consider under our new technology add-on payment policy, we finalized a technical clarification to § 412.87(e)(2) to indicate that new technologies must receive FDA marketing authorization (for example, pre-market approval (PMA); 510(k) clearance; the granting of a De Novo classification request; approval of a New Drug Application (NDA); or Biologics License Application (BLA) licensure) by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. As noted in the FY 2021 IPPS/LTCH PPS final rule, this technical clarification did not change our longstanding policy for evaluating whether a technology is eligible for new technology add-on payment for a given fiscal year, and we continue to consider FDA marketing authorization as representing that a product has received FDA approval or clearance for purposes of eligibility for the new technology add-on payment under § 412.87(e)(2) (85 FR 58742).

An EUA by the FDA allows a product to be used for emergency use, but under our longstanding policy, we believe it would not be considered an FDA marketing authorization for the purpose of new technology add-on payments, as a product that is available only through an EUA is not considered to have an FDA approval or clearance. Therefore, under the current regulations at 42 CFR 412.87(e)(2) and consistent with our longstanding policy of not considering eligibility for new technology add-on payments prior to a product receiving FDA approval or clearance, we believe a product available only through an EUA would not be eligible for new technology add-on payments.

Although an EUA is not an FDA approval or clearance that would be considered FDA marketing authorization within the meaning of § 412.87(e)(2), data reflecting the costs of products that have received an EUA could become available as soon as the date of the EUA issuance and prior to receiving FDA approval or clearance. CMS also recognizes that the manufacturers of products with EUAs (such as some COVID–19 treatments) might further engage with FDA to seek approval or clearance, and may be eligible for new technology add-on payments in the future. We are seeking comment on how data reflecting the costs of a product with an EUA, which may become available upon authorization of the product for emergency use (but prior to FDA approval or clearance), should be considered for purposes of the 2-year to 3-year period of newness for new technology add-on payments for a product with or expected to receive an EUA, including whether the newness period should begin with the date of the EUA.

8. Proposal To Extend the New COVID–19 Treatments Add-On Payment (NCTAP) Through the End of the FY in Which the PHE Ends for Certain Products and Discontinue NCTAP for Products Approved for New Technology Add-on Payments in FY 2022

In response to the COVID–19 PHE, we established the New COVID–19 Treatments Add-on Payment (NCTAP) under the IPPS for COVID–19 cases that meet certain criteria (85 FR 71157–71158). We believe that as drugs and biological products become available and are authorized for emergency use or approved by FDA for the treatment of COVID–19 in the inpatient setting, it is appropriate to increase the current IPPS payment amounts to mitigate any potential financial disincentives for hospitals to provide new COVID–19 treatments during the PHE. Therefore, effective for discharges occurring on or after November 2, 2020 and until the end of the PHE for COVID–19, we established the NCTAP to pay hospitals the lesser of: (1) 65 percent of the operating outlier threshold for the claim; or (2) 65 percent of the amount by which the costs of the case exceed the standard DRG payment, including the adjustment to the relative weight under section 3710 of the Coronavirus Aid, Relief, and Economic Security (CARES) Act, for certain cases that include the use of a drug or biological product currently authorized for emergency use or approved for treating COVID–19.

We anticipate that there might be inpatient cases of COVID–19, beyond the end of the PHE, for which payment based on the assigned MS–DRG may not adequately reflect the additional cost of new COVID–19 treatments. In order to continue to mitigate potential financial disincentives for hospitals to provide these new treatments, and to minimize any potential payment disruption immediately following the end of the PHE, we believe that the NCTAP should remain available for cases involving eligible treatments for the remainder of the fiscal year in which the PHE ends (for example, if the PHE were to end in FY 2022, until September 30, 2022).[932] At the same time, we also believe that any new technology add-on payments that may be approved for a COVID–19 treatment would also serve to mitigate any potential financial disincentives for hospitals to provide that new COVID–19 treatment, such that the NCTAP would no longer be needed for that same product. We note that a COVID–19 treatment that is the subject of an application for FY 2022 new technology add-on payments and which receives FDA approval or clearance by July 1, 2021 would be eligible for consideration for new technology add-on payments for FY 2022.

Therefore, we are proposing to extend the NCTAP for eligible products that are not approved for new technology add-on payments through the end of the fiscal year in which the PHE ends (for example, September 30, 2022). We are also proposing to discontinue the NCTAP for discharges on or after October 1, 2021 for a product that is approved for new technology add-on payments beginning FY 2022.

We believe this proposal to extend NCTAP for eligible products would allow some form of add-on payment (that is, NCTAP or new technology add-on payment) to continue uninterrupted for some period of time following the conclusion of the COVID–19 PHE, as we anticipate that there will continue to be inpatient cases of COVID–19 after the PHE ends. For example, if a drug or biological product with an EUA to treat COVID–19 does not receive FDA approval by July 1, 2021, and the PHE ends on December 31, 2021, this proposal would allow discharges involving that product to continue to be eligible for the NCTAP through September 30, 2022 (the end of FY 2022). If that same product receives FDA approval by July 1, 2022, it would be eligible for consideration of new technology add-on payments beginning FY 2023, and new technology add-on payments, if approved, would begin on October 1, 2022 (the beginning of FY 2023).

We invite public comment on our proposals to continue the NCTAP for eligible products that are not approved for new technology add-on payments through the end of the fiscal year in which the PHE ends and to discontinue the NCTAP for products that are approved for new technology add-on payments.

[932] On January 22, 2021, former Acting HHS Secretary Norris Cochran sent a letter to governors announcing that HHS has determined that the public health emergency will likely remain in place for the entirety of 2021, and when a decision is made to terminate the declaration or let it expire, HHS will provide states with 60 days' notice prior to termination.

III. Proposed Changes to the Hospital Wage Index for Acute Care Hospitals

A. Background

1. Legislative Authority

Section 1886(d)(3)(E) of the Act requires that, as part of the methodology for determining prospective payments to hospitals, the Secretary adjust the standardized amounts for area differences in hospital wage levels by a factor (established by the Secretary) reflecting the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level. We currently define hospital labor market areas based on the delineations of statistical areas established by the Office of Management and Budget (OMB). A discussion of the proposed FY 2022 hospital wage index based on the statistical areas appears under section III.A.2. of the preamble of this proposed rule.

Section 1886(d)(3)(E) of the Act requires the Secretary to update the wage index annually and to base the update on a survey of wages and wage-related costs of short-term, acute care hospitals. (CMS collects these data on the Medicare cost report, CMS Form 2552–10, Worksheet S–3, Parts II, III, and IV. The OMB control number for approved collection of this information is 0938–0050, which expires on March 31, 2022.) This provision also requires that any updates or adjustments to the wage index be made in a manner that ensures that aggregate payments to hospitals are not affected by the change in the wage index. The proposed adjustment for FY 2022 is discussed in section II.B. of the Addendum to this proposed rule.

As discussed in section III.I. of the preamble of this proposed rule, we also take into account the geographic reclassification of hospitals in accordance with sections 1886(d)(8)(B) and 1886(d)(10) of the Act when calculating IPPS payment amounts. Under section 1886(d)(8)(D) of the Act, the Secretary is required to adjust the standardized amounts so as to ensure that aggregate payments under the IPPS after implementation of the provisions of sections 1886(d)(8)(B), 1886(d)(8)(C), and 1886(d)(10) of the Act are equal to the aggregate prospective payments that would have been made absent these provisions. The proposed budget neutrality adjustment for FY 2022 is discussed in section II.A.4.b. of the Addendum to this proposed rule.

Section 1886(d)(3)(E) of the Act also provides for the collection of data every 3 years on the occupational mix of employees for short-term, acute care hospitals participating in the Medicare program, in order to construct an occupational mix adjustment to the wage index. A discussion of the occupational mix adjustment that we are proposing to apply to the FY 2022 wage index appears under sections III.E. and F. of the preamble of this proposed rule.

2. Core-Based Statistical Areas (CBSAs) for the Proposed FY 2022 Hospital Wage Index

The wage index is calculated and assigned to hospitals on the basis of the labor market area in which the hospital is located. Under section 1886(d)(3)(E) of the Act, beginning with FY 2005, we delineate hospital labor market areas based on OMB-established Core-Based Statistical Areas (CBSAs). The current statistical areas (which were implemented beginning with FY 2015) are based on revised OMB delineations issued on February 28, 2013, in OMB Bulletin No. 13–01. OMB Bulletin No. 13–01 established revised delineations for Metropolitan Statistical Areas, Micropolitan Statistical Areas, and Combined Statistical Areas in the United States and Puerto Rico based on the 2010 Census, and provided guidance on the use of the delineations of these statistical areas using standards published in the June 28, 2010 **Federal Register** (75 FR 37246 through 37252). We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 49951 through 49963 and 49973 through 49982)) for a full discussion of our implementation of the OMB statistical area delineations beginning with the FY 2015 wage index.

Generally, OMB issues major revisions to statistical areas every 10 years, based on the results of the decennial census. However, OMB occasionally issues minor updates and revisions to statistical areas in the years between the decennial censuses through OMB Bulletins. On July 15, 2015, OMB issued OMB Bulletin No. 15–01, which provided updates to and superseded OMB Bulletin No. 13–01 that was issued on February 28, 2013. The attachment to OMB Bulletin No. 15–01 provided detailed information on the update to statistical areas since February 28, 2013. The updates provided in OMB Bulletin No. 15–01 were based on the application of the 2010 Standards for Delineating Metropolitan and Micropolitan Statistical Areas to Census Bureau population estimates for July 1, 2012 and July 1, 2013. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56913), we adopted the updates set forth in OMB Bulletin No. 15–01 effective October 1, 2016, beginning with the FY 2017 wage index. For a complete discussion of the adoption of the updates set forth in OMB Bulletin No. 15–01, we refer readers to the FY 2017 IPPS/LTCH PPS final rule. In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38130), we continued to use the OMB delineations that were adopted beginning with FY 2015 to calculate the area wage indexes, with updates as reflected in OMB Bulletin No. 15–01 specified in the FY 2017 IPPS/LTCH PPS final rule.

On August 15, 2017, OMB issued OMB Bulletin No. 17–01, which provided updates to and superseded OMB Bulletin No. 15–01 that was issued on July 15, 2015. The attachments to OMB Bulletin No. 17–01 provided detailed information on the update to statistical areas since July 15, 2015, and were based on the application of the 2010 Standards for Delineating Metropolitan and Micropolitan Statistical Areas to Census Bureau population estimates for July 1, 2014 and July 1, 2015. In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41362 through 41363), we adopted the updates set forth in OMB Bulletin No. 17–01 effective October 1, 2018, beginning with the FY 2019 wage index. For a complete discussion of the adoption of the updates set forth in OMB Bulletin No. 17–01, we refer readers to the FY 2019 IPPS/LTCH PPS final rule. In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42300 through 42301), we continued to use the OMB delineations that were adopted beginning with FY 2015 (based on the revised delineations issued in OMB Bulletin No. 13–01) to calculate the area wage indexes, with updates as reflected in OMB Bulletin Nos. 15–01 and 17–01.

On April 10, 2018 OMB issued OMB Bulletin No. 18–03 which superseded the August 15, 2017 OMB Bulletin No. 17–01. On September 14, 2018, OMB issued OMB Bulletin No. 18–04 which superseded the April 10, 2018 OMB Bulletin No. 18–03. Typically, interim OMB bulletins (those issued between decennial censuses) have only contained minor modifications to labor market delineations. However, the April 10, 2018 OMB Bulletin No. 18–03 and the September 14, 2018 OMB Bulletin No. 18–04 included more modifications to the labor market areas than are typical for OMB bulletins issued between decennial censuses, including some material modifications that had a number of downstream effects, such as reclassification changes. These bulletins established revised delineations for Metropolitan Statistical Areas, Micropolitan Statistical Areas, and

Combined Statistical Areas, and provided guidance on the use of the delineations of these statistical areas. In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58743 through 58755) we adopted the updates set forth in OMB Bulletin No. 18–04 effective October 1, 2018, beginning with the FY 2021 wage index. For a complete discussion of the adoption of the updates set forth in OMB Bulletin No. 18–04, we refer readers to the FY 2021 IPPS/LTCH PPS final rule.

On March 6, 2020, OMB issued Bulletin No. 20–01, which provided updates to and superseded OMB Bulletin No. 18–04 that was issued on September 14, 2018. The attachments to OMB Bulletin No. 20–01 provided detailed information on the update to statistical areas since September 14, 2018, and were based on the application of the 2010 Standards for Delineating Metropolitan and Micropolitan Statistical Areas to Census Bureau population estimates for July 1, 2017 and July 1, 2018. (For a copy of this bulletin, we refer readers to the following website: *https://www.whitehouse.gov/wp-content/uploads/2020/03/Bulletin-20-01.pdf*). In OMB Bulletin No. 20–01, OMB announced one new Micropolitan Statistical Area, one new component of an existing Combined Statistical Area and changes to New England City and Town Area (NECTA) delineations. In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58744), we stated that if appropriate, we would propose any updates from OMB Bulletin No. 20–01 in the FY 2022 IPPS/LTCH PPS proposed rule. After reviewing OMB Bulletin No. 20–01, we have determined that the changes in Bulletin 20–01 encompassed delineation changes that would not affect the Medicare wage index for FY 2022. Specifically, the updates consisted of changes to NECTA delineations and the creation of a new Micropolitan Statistical Area which was then added as a new component to an existing Micropolitan Statistical Area. The Medicare wage index does not utilize NECTA definitions, and, as most recently discussed in FY 2021 IPPS/LTCH PPS final rule (85 FR 58746), we include hospitals located in Micropolitan Statistical areas in each State's rural wage index. Therefore, while we are proposing to adopt the updates set forth in OMB Bulletin No. 20–01 consistent with our longstanding policy of adopting OMB delineation updates, we note that specific wage index updates would not be necessary for FY 2022 as a result of adopting these OMB updates. In other words, these OMB updates would not affect any hospital's geographic area for purposes of the wage index calculation for FY 2022.

For FY 2022, we would continue to use the OMB delineations that were adopted beginning with FY 2015 (based on the revised delineations issued in OMB Bulletin No. 13–01) to calculate the area wage indexes, with updates as reflected in OMB Bulletin Nos. 15–01, 17–01 and 18–04.

We note that, in connection with our adoption in FY 2021 of the updates in OMB Bulletin 18–04, we adopted a policy to place a 5 percent cap, for FY 2021, on any decrease in a hospital's wage index from the hospital's final wage index in FY 2020 so that a hospital's final wage index for FY 2021 would not be less than 95 percent of its final wage index for FY 2020. We refer the reader to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58753 through 58755) for a complete discussion of this transition. As finalized in the FY 2021 IPPS/LTCH PPS final rule, this transition is set to expire at the end of FY 2021. However, given the unprecedented nature of the ongoing COVID–19 PHE, we also seek comment on whether it would be appropriate to continue to apply a transition to the FY 2022 wage index for hospitals negatively impacted by our adoption of the updates in OMB Bulletin 18–04. For example, such an extended transition could potentially take the form of holding the FY 2022 wage index for those hospitals harmless from any reduction relative to their FY 2021 wage index. If we were to apply a transition to the FY 2022 wage index for hospitals negatively impacted by our adoption of the updates in OMB Bulletin 18–04, we also seek comment on making this transition budget neutral, as is our usual practice, in the same manner that the FY 2021 transition was made budget neutral as discussed in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58755).

3. Codes for Constituent Counties in CBSAs

CBSAs are made up of one or more constituent counties. Each CBSA and constituent county has its own unique identifying codes. There are two different lists of codes associated with counties: Social Security Administration (SSA) codes and Federal Information Processing Standard (FIPS) codes. Historically, CMS has listed and used SSA and FIPS county codes to identify and crosswalk counties to CBSA codes for purposes of the hospital wage index. As we discussed in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38129 through 38130), we have learned that SSA county codes are no longer being maintained and updated. However, the FIPS codes continue to be maintained by the U.S. Census Bureau. We believe that using the latest FIPS codes will allow us to maintain a more accurate and up-to-date payment system that reflects the reality of population shifts and labor market conditions.

The Census Bureau's most current statistical area information is derived from ongoing census data received since 2010; the most recent data are from 2020. The Census Bureau maintains a complete list of changes to counties or county equivalent entities on the website at: *https://www.census.gov/programs-surveys/geography/technical-documentation/county-changes.html*. We believe that it is important to use the latest counties or county equivalent entities in order to properly crosswalk hospitals from a county to a CBSA for purposes of the hospital wage index used under the IPPS.

In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38129 through 38130), we adopted a policy to discontinue the use of the SSA county codes and began using only the FIPS county codes for purposes of crosswalking counties to CBSAs. In addition, in the same rule, we implemented the latest FIPS code updates, which were effective October 1, 2017, beginning with the FY 2018 wage indexes. These updates have been used to calculate the wage indexes in a manner generally consistent with the CBSA-based methodologies finalized in the FY 2005 IPPS final rule and the FY 2015 IPPS/LTCH PPS final rule.

For FY 2022, we are continuing to use only the FIPS county codes for purposes of crosswalking counties to CBSAs. For FY 2022, Tables 2 and 3 associated with this proposed rule and the County to CBSA Crosswalk File and Urban CBSAs and Constituent Counties for Acute Care Hospitals File posted on the CMS website reflect the latest FIPS code updates.

B. Worksheet S–3 Wage Data for the Proposed FY 2022 Wage Index

The proposed FY 2022 wage index values are based on the data collected from the Medicare cost reports submitted by hospitals for cost reporting periods beginning in FY 2018 (the FY 2021 wage indexes were based on data from cost reporting periods beginning during FY 2017).

1. Included Categories of Costs

The proposed FY 2022 wage index includes all of the following categories of data associated with costs paid under the IPPS (as well as outpatient costs):

- Salaries and hours from short-term, acute care hospitals (including paid lunch hours and hours associated with military leave and jury duty);
- Home office costs and hours;
- Certain contract labor costs and hours, which include direct patient care, certain top management, pharmacy, laboratory, and nonteaching physician Part A services, and certain contract indirect patient care services (as discussed in the FY 2008 final rule with comment period (72 FR 47315 through 47317)); and
- Wage-related costs, including pension costs (based on policies adopted in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51586 through 51590)) and other deferred compensation costs.

2. Excluded Categories of Costs

Consistent with the wage index methodology for FY 2021, the proposed wage index for FY 2022 also excludes the direct and overhead salaries and hours for services not subject to IPPS payment, such as skilled nursing facility (SNF) services, home health services, costs related to GME (teaching physicians and residents) and certified registered nurse anesthetists (CRNAs), and other subprovider components that are not paid under the IPPS. The proposed FY 2022 wage index also excludes the salaries, hours, and wage-related costs of hospital-based rural health clinics (RHCs), and Federally qualified health centers (FQHCs) because Medicare pays for these costs outside of the IPPS (68 FR 45395). In addition, salaries, hours, and wage-related costs of CAHs are excluded from the wage index for the reasons explained in the FY 2004 IPPS final rule (68 FR 45397 through 45398). For FY 2020 and subsequent years, other wage-related costs are also excluded from the calculation of the wage index. As discussed in the FY 2019 IPPS/LTCH final rule (83 FR 41365 through 41369), other wage-related costs reported on Worksheet S–3, Part II, Line 18 and Worksheet S–3, Part IV, Line 25 and subscripts, as well as all other wage-related costs, such as contract labor costs, are excluded from the calculation of the wage index.

3. Use of Wage Index Data by Suppliers and Providers Other Than Acute Care Hospitals Under the IPPS

Data collected for the IPPS wage index also are currently used to calculate wage indexes applicable to suppliers and other providers, such as SNFs, home health agencies (HHAs), ambulatory surgical centers (ASCs), and hospices. In addition, they are used for prospective payments to IRFs, IPFs, and LTCHs, and for hospital outpatient services. We note that, in the IPPS rules, we do not address comments pertaining to the wage indexes of any supplier or provider except IPPS providers and LTCHs. Such comments should be made in response to separate proposed rules for those suppliers and providers.

C. Verification of Worksheet S–3 Wage Data

The wage data for the proposed FY 2022 wage index were obtained from Worksheet S–3, Parts II and III of the Medicare cost report (Form CMS–2552–10, OMB Control Number 0938–0050 with expiration date March 31, 2022) for cost reporting periods beginning on or after October 1, 2017, and before October 1, 2018. For wage index purposes, we refer to cost reports during this period as the ''FY 2018 cost report,'' the ''FY 2018 wage data,'' or the ''FY 2018 data.'' Instructions for completing the wage index sections of Worksheet S–3 are included in the Provider Reimbursement Manual (PRM), Part 2 (Pub. 15–2), Chapter 40, Sections 4005.2 through 4005.4. The data file used to construct the proposed final FY 2022 wage index includes FY 2018 data submitted to us as of February 5, 2021. As in past years, we performed an extensive review of the wage data, mostly through the use of edits designed to identify aberrant data.

We asked our MACs to revise or verify data elements that result in specific edit failures. For the proposed FY 2022 wage index, we identified and excluded 86 providers with aberrant data that should not be included in the wage index. If data elements for some of these providers are corrected, we intend to include data from those providers in the final FY 2022 wage index. We also adjusted certain aberrant data and included these data in the wage index. For example, in situations where a hospital did not have documentable salaries, wages, and hours for housekeeping and dietary services, we imputed estimates, in accordance with policies established in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49965 through 49967). We instructed MACs to complete their data verification of questionable data elements and to transmit any changes to the wage data no later than March 19, 2021.

In constructing the proposed FY 2022 wage index, we included the wage data for facilities that were IPPS hospitals in FY 2018, inclusive of those facilities that have since terminated their participation in the program as hospitals, as long as those data did not fail any of our edits for reasonableness. We believe including the wage data for these hospitals is, in general, appropriate to reflect the economic conditions in the various labor market areas during the relevant past period and to ensure that the current wage index represents the labor market area's current wages as compared to the national average of wages. However, we excluded the wage data for CAHs as discussed in the FY 2004 IPPS final rule (68 FR 45397 through 45398); that is, any hospital that is designated as a CAH by 7 days prior to the publication of the preliminary wage index public use file (PUF) is excluded from the calculation of the wage index. For the proposed rule, we removed 3 hospitals that converted to CAH status on or after January 24, 2020, the cut-off date for CAH exclusion from the FY 2021 wage index, and through and including January 24, 2021, the cut-off date for CAH exclusion from the FY 2022 wage index. In summary, we calculated the proposed FY 2021 wage index using the Worksheet S–3, Parts II and III wage data of 3,159 hospitals.

For the proposed FY 2022 wage index, we allotted the wages and hours data for a multicampus hospital among the different labor market areas where its campuses are located using campus full-time equivalent (FTE) percentages as originally finalized in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51591). Table 2, which contains the proposed FY 2022 wage index associated with this proposed rule (available via the internet on the CMS website), includes separate wage data for the campuses of 16 multicampus hospitals. The following chart lists the multicampus hospitals by CSA certification number (CCN) and the FTE percentages on which the wages and hours of each campus were allotted to their respective labor market areas:

BILLING CODE 4120–01–P

CCN of Multicampus Hospital	Full-Time Equivalent (FTE) Percentages
050121	0.85
05B121	0.15
070022	0.99
07B022	0.01
070033	0.93
07B033	0.07
100029	0.55
10B029	0.45
100167	0.55
10B167	0.45

CCN of Multicampus Hospital	Full-Time Equivalent (FTE) Percentages
140010	0.82
14B010	0.18
220074	0.89
22B074	0.11
330195	0.89
33B195	0.11
330234	0.75
33B234	0.25
340115	0.95
34B115	0.05
360020	0.97
36B020	0.03
390006	0.94
39B006	0.06
390115	0.86
39B115	0.14
390142	0.83
39B142	0.17
450330	0.98
45B330	0.02
460051	0.81
46B051	0.19
510022	0.94
51B022	0.06
520009	0.71
52B009	0.29
670062	0.66
67B062	0.34

BILLING CODE 4120–01–C

We note that, in past years, in Table 2, we have placed a ''B'' to designate the subordinate campus in the fourth position of the hospital CCN. However, for the FY 2019 IPPS/LTCH PPS proposed and final rules and subsequent rules, we have moved the ''B'' to the third position of the CCN. Because all IPPS hospitals have a ''0'' in the third position of the CCN, we believe that placement of the ''B'' in this third

position, instead of the ''0'' for the subordinate campus, is the most efficient method of identification and interferes the least with the other, variable, digits in the CCN.

D. Method for Computing the Proposed FY 2022 Unadjusted Wage Index

The method used to compute the proposed FY 2022 wage index without an occupational mix adjustment follows the same methodology that we used to compute the wage indexes without an occupational mix adjustment in the FY 2021 IPPS/LTCH PPS final rule (see 85 FR 58758 through 58761, September 18, 2020), and we are not proposing any changes to this methodology. We have restated our methodology in this section of this rule.

Step 1.—We gathered data from each of the non-Federal, short-term, acute care hospitals for which data were reported on the Worksheet S–3, Parts II and III of the Medicare cost report for the hospital's cost reporting period relevant to the proposed wage index (in this case, for FY 2022, these were data from cost reports for cost reporting periods beginning on or after October 1, 2017, and before October 1, 2018). In addition, we included data from some hospitals that had cost reporting periods beginning before October 2017 and reported a cost reporting period covering all of FY 2018. These data were included because no other data from these hospitals would be available for the cost reporting period as previously described, and because particular labor market areas might be affected due to the omission of these hospitals. However, we generally describe these wage data as FY 2018 data. We note that, if a hospital had more than one cost reporting period beginning during FY 2018 (for example, a hospital had two short cost reporting periods beginning on or after October 1, 2017, and before October 1, 2018), we include wage data from only one of the cost reporting periods, the longer, in the wage index calculation. If there was more than one cost reporting period and the periods were equal in length, we included the wage data from the later period in the wage index calculation.

Step 2.—Salaries.—The method used to compute a hospital's average hourly wage excludes certain costs that are not paid under the IPPS. (We note that, beginning with FY 2008 (72 FR 47315), we included what were then Lines 22.01, 26.01, and 27.01 of Worksheet S–3, Part II of CMS Form 2552–96 for overhead services in the wage index. Currently, these lines are lines 28, 33, and 35 on CMS Form 2552–10. However, we note that the wages and hours on these lines are not incorporated into Line 101, Column 1 of Worksheet A, which, through the electronic cost reporting software, flows directly to Line 1 of Worksheet S–3, Part II. Therefore, the first step in the wage index calculation is to compute a ''revised'' Line 1, by adding to the Line 1 on Worksheet S–3, Part II (for wages and hours respectively) the amounts on Lines 28, 33, and 35.) In calculating a hospital's Net Salaries (we note that we previously used the term ''average'' salaries in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51592), but we now use the term ''net'' salaries) plus wage-related costs, we first compute the following: Subtract from Line 1 (total salaries) the GME and CRNA costs reported on CMS Form 2552–10, Lines 2, 4.01, 7, and 7.01, the Part B salaries reported on Lines 3, 5 and 6, home office salaries reported on Line 8, and exclude salaries reported on Lines 9 and 10 (that is, direct salaries attributable to SNF services, home health services, and other subprovider components not subject to the IPPS). We also subtract from Line 1 the salaries for which no hours were reported. Therefore, the formula for Net Salaries (from Worksheet S–3, Part II) is the following:

((Line 1 + Line 28 + Line 33 + Line 35) − (Line 2 + Line 3 + Line 4.01 + Line 5 + Line 6 + Line 7 + Line 7.01 + Line 8 + Line 9 + Line 10)).

To determine Total Salaries plus Wage-Related Costs, we add to the Net Salaries the costs of contract labor for direct patient care, certain top management, pharmacy, laboratory, and nonteaching physician Part A services (Lines 11, 12 and 13), home office salaries and wage-related costs reported by the hospital on Lines 14.01, 14.02, and 15, and nonexcluded area wage-related costs (Lines 17, 22, 25.50, 25.51, and 25.52). We note that contract labor and home office salaries for which no corresponding hours are reported are not included. In addition, wage-related costs for nonteaching physician Part A employees (Line 22) are excluded if no corresponding salaries are reported for those employees on Line 4. The formula for Total Salaries plus Wage-Related Costs (from Worksheet S–3, Part II) is the following:

((Line 1 + Line 28 + Line 33 + Line 35) − (Line 2 + Line 3 + Line 4.01 + Line 5 + Line 6 + Line 7 + Line 7.01 + Line 8 + Line 9 + Line 10)) + (Line 11 + Line 12 + Line 13 + Line 14.01 + 14.02 + Line 15) + (Line 17 + Line 22 + 25.50 + 25.51 + 25.52).

Step 3.—Hours.—With the exception of wage-related costs, for which there are no associated hours, we compute total hours using the same methods as described for salaries in Step 2. The formula for Total Hours (from Worksheet S–3, Part II) is the following:

((Line 1 + Line 28 + Line 33 + Line 35) − (Line 2 + Line 3 + Line 4.01 + Line 5 + Line 6 + Line 7 + Line 7.01 + Line 8 + Line 9 + Line 10)) + (Line 11 + Line 12 + Line 13 + Line 14.01 + 14.02 + Line 15).

Step 4.—For each hospital reporting both total overhead salaries and total overhead hours greater than zero, we then allocate overhead costs to areas of the hospital excluded from the wage index calculation. First, we determine the ''excluded rate'', which is the ratio of excluded area hours to Revised Total Hours (from Worksheet S–3, Part II) with the following formula: (Line 9 + Line 10)/(Line 1 + Line 28 + Line 33 + Line 35) − (Lines 2, 3, 4.01, 5, 6, 7, 7.01, and 8 and Lines 26 through 43). We then compute the amounts of overhead salaries and hours to be allocated to the excluded areas by multiplying the above ratio by the total overhead salaries and hours reported on Lines 26 through 43 of Worksheet S–3, Part II. Next, we compute the amounts of overhead wage-related costs to be allocated to the excluded areas using three steps:

- We determine the ''overhead rate'' (from Worksheet S–3, Part II), which is the ratio of overhead hours (Lines 26 through 43 minus the sum of Lines 28, 33, and 35) to revised hours excluding the sum of lines 28, 33, and 35 (Line 1 minus the sum of Lines 2, 3, 4.01, 5, 6, 7, 7.01, 8, 9, 10, 28, 33, and 35). We note that, for the FY 2008 and subsequent wage index calculations, we have been excluding the overhead contract labor (Lines 28, 33, and 35) from the determination of the ratio of overhead hours to revised hours because hospitals typically do not provide fringe benefits (wage-related costs) to contract personnel. Therefore, it is not necessary for the wage index calculation to exclude overhead wage-related costs for contract personnel. Further, if a hospital does contribute to wage-related costs for contracted personnel, the instructions for Lines 28, 33, and 35 require that associated wage-related costs be combined with wages on the respective contract labor lines. The formula for the Overhead Rate (from Worksheet S–3, Part II) is the following:

(Lines 26 through 43 − Lines 28, 33 and 35)/((((Line 1 + Lines 28, 33, 35) − (Lines 2, 3, 4.01, 5, 6, 7, 7.01, 8, and 26 through 43)) − (Lines 9 and 10)) + (Lines 26 through 43 − Lines 28, 33, and 35)).

- We compute overhead wage-related costs by multiplying the overhead hours

ratio by wage-related costs reported on Part II, Lines 17, 22, 25.50, 25.51, and 25.52.

• We multiply the computed overhead wage-related costs by the previously described excluded area hours ratio.

Finally, we subtract the computed overhead salaries, wage-related costs, and hours associated with excluded areas from the total salaries (plus wage-related costs) and hours derived in Steps 2 and 3.

Step 5.—For each hospital, we adjust the total salaries plus wage-related costs to a common period to determine total adjusted salaries plus wage-related costs. To make the wage adjustment, we estimate the percentage change in the employment cost index (ECI) for compensation for each 30-day increment from October 14, 2017 through April 15, 2019, for private industry hospital workers from the BLS' Compensation and Working Conditions. We use the ECI because it reflects the price increase associated with total compensation (salaries plus fringes) rather than just the increase in salaries. In addition, the ECI includes managers as well as other hospital workers. This methodology to compute the monthly update factors uses actual quarterly ECI data and assures that the update factors match the actual quarterly and annual percent changes. We also note that, since April 2006 with the publication of March 2006 data, the BLS' ECI uses a different classification system, the North American Industrial Classification System (NAICS), instead of the Standard Industrial Codes (SICs), which no longer exist. We have consistently used the ECI as the data source for our wages and salaries and other price proxies in the IPPS market basket, and we are not proposing to make any changes to the usage of the ECI for FY 2022. The factors used to adjust the hospital's data are based on the midpoint of the cost reporting period, as indicated in this rule.

Step 6.—Each hospital is assigned to its appropriate urban or rural labor market area before any reclassifications under section 1886(d)(8)(B), 1886(d)(8)(E), or 1886(d)(10) of the Act. Within each urban or rural labor market area, we add the total adjusted salaries plus wage-related costs obtained in Step 5 for all hospitals in that area to determine the total adjusted salaries plus wage-related costs for the labor market area.

Step 7.—We divide the total adjusted salaries plus wage-related costs obtained under Step 6 by the sum of the corresponding total hours (from Step 4) for all hospitals in each labor market area to determine an average hourly wage for the area.

Step 8.—We add the total adjusted salaries plus wage-related costs obtained in Step 5 for all hospitals in the Nation and then divide the sum by the national sum of total hours from Step 4 to arrive at a national average hourly wage.

Step 9.—For each urban or rural labor market area, we calculate the hospital wage index value, unadjusted for occupational mix, by dividing the area average hourly wage obtained in Step 7 by the national average hourly wage computed in Step 8.

Step 10.—For each urban labor market area for which we do not have any hospital wage data (either because there are no IPPS hospitals in that labor market area, or there are IPPS hospitals in that area but their data are either too new to be reflected in the current year's wage index calculation, or their data are aberrant and are deleted from the wage index), we finalized in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42305) that, for FY 2020 and subsequent years' wage index calculations, such CBSA's wage index would be equal to total urban salaries plus wage-related costs (from Step 5) in the State, divided by the total urban hours (from Step 4) in the State, divided by the national average hourly wage from Step 8 (see 84 FR 42305 and 42306) August 16, 2019). We stated that we believe that, in the absence of wage data for an urban labor market area, it is reasonable to use a statewide urban average, which is based on actual, acceptable wage data of hospitals in that State, rather than impute some other type of value using a different methodology. For calculation of the proposed FY 2022 wage index, we note there is one urban CBSA for which we do not have IPPS hospital wage data. In Table 3 (which is available via the internet on the CMS website) which contains the area wage indexes, we include a footnote to indicate to which CBSAs this policy applies. These CBSAs' wage indexes would be equal to total urban salaries plus wage-related costs (from Step 5) in the respective State, divided by the total urban hours (from Step 4) in the respective State, divided by the national average hourly wage (from Step 8) (see 84 FR 42305 and 42306) August 16, 2019). Under this step, we also apply our policy with regard to how dollar amounts, hours, and other numerical values in the wage index calculations are rounded, as discussed in this section of this rule.

We refer readers to section II. of the Appendix of the proposed rule for the policy regarding rural areas that do not have IPPS hospitals.

Step 11.—Section 4410 of Pub. L. 105–33 provides that, for discharges on or after October 1, 1997, the area wage index applicable to any hospital that is located in an urban area of a State may not be less than the area wage index applicable to hospitals located in rural areas in that State. The areas affected by this provision are identified in Table 2 listed in section VI. of the Addendum to the proposed rule and available via the internet on the CMS website.

Following is our policy with regard to rounding of the wage data (dollar amounts, hours, and other numerical values) in the calculation of the unadjusted and adjusted wage index, as finalized in the FY 2020 IPPS/LTCH final rule (84 FR 42306; August 16, 2019). For data that we consider to be ''raw data,'' such as the cost report data on Worksheets S–3, Parts II and III, and the occupational mix survey data, we use such data ''as is,'' and do not round any of the individual line items or fields. However, for any dollar amounts within the wage index calculations, including any type of summed wage amount, average hourly wages, and the national average hourly wage (both the unadjusted and adjusted for occupational mix), we round the dollar amounts to 2 decimals. For any hour amounts within the wage index calculations, we round such hour amounts to the nearest whole number. For any numbers not expressed as dollars or hours within the wage index calculations, which could include ratios, percentages, or inflation factors, we round such numbers to 5 decimals. However, we continue rounding the actual unadjusted and adjusted wage indexes to 4 decimals, as we have done historically.

As discussed in the FY 2012 IPPS/LTCH PPS final rule, in ''Step 5,'' for each hospital, we adjust the total salaries plus wage-related costs to a common period to determine total adjusted salaries plus wage-related costs. To make the wage adjustment, we estimate the percentage change in the employment cost index (ECI) for compensation for each 30-day increment from October 14, 2017, through April 15, 2019, for private industry hospital workers from the BLS' *Compensation and Working Conditions.* We have consistently used the ECI as the data source for our wages and salaries and other price proxies in the IPPS market basket, and we are not proposing any changes to the usage of the ECI for FY 2022. The factors used to adjust the hospital's data were based on the midpoint of the cost reporting period, as indicated in the following table.

MIDPOINT OF COST REPORTING PERIOD

After	Before	Adjustment Factor
10/14/2017	11/15/2017	1.03317
11/14/2017	12/15/2017	1.03154
12/14/2017	01/15/2017	1.02988
01/14/2018	02/15/2018	1.02816
02/14/2018	03/15/2018	1.02638
03/14/2018	04/15/2018	1.02447
04/14/2018	05/15/2018	1.02238
05/14/2018	06/15/2018	1.02011
06/14/2018	07/15/2018	1.01780
07/14/2018	08/15/2018	1.01560
08/14/2018	09/15/2018	1.01350
09/14/2018	10/15/2018	1.01140
10/14/2018	11/15/2018	1.00920
11/14/2018	12/15/2018	1.00690
12/14/2018	01/15/2019	1.00456
01/14/2019	02/15/2019	1.00226
02/14/2019	03/15/2019	1.00000
03/14/2019	04/15/2019	0.99781

For example, the midpoint of a cost reporting period beginning January 1, 2018, and ending December 31, 2018, is June 30, 2018. An adjustment factor of 1.01780 was applied to the wages of a hospital with such a cost reporting period.

Previously, we also would provide a Puerto Rico overall average hourly wage. As discussed in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56915), prior to January 1, 2017, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, we calculated a Puerto Rico specific wage index that was applied to the labor-related share of the Puerto Rico-specific standardized amount. Section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. As we stated in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56915 through 56916), because Puerto Rico hospitals are no longer paid with a Puerto Rico specific standardized amount as of January 1, 2016, under section 1886(d)(9)(E) of the Act, as amended by section 601 of the Consolidated Appropriations Act, 2016, there is no longer a need to calculate a Puerto Rico specific average hourly wage and wage index. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the national average hourly wage (unadjusted for occupational mix) and the national wage index, which is applied to the national labor-related share of the national standardized amount. Therefore, for FY 2022, there is no Puerto Rico-specific overall average hourly wage or wage index.

Based on the methodology, as previously discussed, the proposed FY 2022 unadjusted national average hourly wage is the following:

Proposed FY 2022 Unadjusted National Average Hourly Wage	$46.42

E. Proposed Occupational Mix Adjustment to the FY 2022 Wage Index

As stated earlier, section 1886(d)(3)(E) of the Act provides for the collection of data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program, in order to construct an occupational mix adjustment to the wage index, for application beginning October 1, 2004 (the FY 2005 wage index). The purpose of the occupational mix adjustment is to control for the effect of hospitals' employment choices on the wage index. For example, hospitals may choose to employ different combinations of registered nurses, licensed practical nurses, nursing aides, and medical assistants for the purpose of providing nursing care to their patients. The varying labor costs associated with these choices reflect hospital management decisions rather than geographic differences in the costs of labor.

1. Use of 2019 Medicare Wage Index Occupational Mix Survey for the FY 2022 Wage Index

Section 304(c) of the Consolidated Appropriations Act, 2001 (Pub. L. 106–554) amended section 1886(d)(3)(E) of the Act to require CMS to collect data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program. As discussed in the FY 2018 IPPS/LTCH PPS proposed rule (82 FR 19903) and final rule (82 FR 38137), we collected data in 2016 to

compute the occupational mix adjustment for the FY 2019, FY 2020, and FY 2021 wage indexes. A new measurement of occupational mix is required for FY 2022.

The FY 2022 occupational mix adjustment is based on a new calendar year (CY) 2019 survey. Hospitals were required to submit their completed 2019 surveys (Form CMS–10079, OMB number 0938–0907, expiration date September 31, 2022) to their MACs by September 3, 2020. The preliminary, unaudited CY 2019 survey data were posted on the CMS website on September 8, 2020. As with the Worksheet S–3, Parts II and III cost report wage data, as part of the FY 2022 desk review process, the MACs revised or verified data elements in hospitals' occupational mix surveys that resulted in certain edit failures.

2. Calculation of the Occupational Mix Adjustment for FY 2022

For FY 2022, we are proposing to calculate the occupational mix adjustment factor using the same methodology that we have used since the FY 2012 wage index (76 FR 51582 through 51586) and to apply the occupational mix adjustment to 100 percent of the proposed FY 2022 wage index. In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42308), we modified our methodology with regard to how dollar amounts, hours, and other numerical values in the unadjusted and adjusted wage index calculation are rounded, in order to ensure consistency in the calculation. According to the policy finalized in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42308 and 42309), for data that we consider to be ''raw data,'' such as the cost report data on Worksheets S–3, Parts II and III, and the occupational mix survey data, we continue to use these data ''as is'', and not round any of the individual line items or fields. However, for any dollar amounts within the wage index calculations, including any type of summed wage amount, average hourly wages, and the national average hourly wage (both the unadjusted and adjusted for occupational mix), we round such dollar amounts to 2 decimals. We round any hour amounts within the wage index calculations to the nearest whole number. We round any numbers not expressed as dollars or hours in the wage index calculations, which could include ratios, percentages, or inflation factors, to 5 decimals. However, we continue rounding the actual unadjusted and adjusted wage indexes to 4 decimals, as we have done historically.

Similar to the method we use for the calculation of the wage index without occupational mix, salaries and hours for a multicampus hospital are allotted among the different labor market areas where its campuses are located. Table 2 associated with this proposed rule (which is available via the internet on the CMS website), which contains the proposed FY 2022 occupational mix adjusted wage index, includes separate wage data for the campuses of multicampus hospitals. We refer readers to section III.C. of the preamble of this proposed rule for a chart listing the multicampus hospitals and the FTE percentages used to allot their occupational mix data.

Because the statute requires that the Secretary measure the earnings and paid hours of employment by occupational category not less than once every 3 years, all hospitals that are subject to payments under the IPPS, or any hospital that would be subject to the IPPS if not granted a waiver, must complete the occupational mix survey, unless the hospital has no associated cost report wage data that are included in the proposed FY 2022 wage index. For the proposed FY 2022 wage index, we are using the Worksheet S–3, Parts II and III wage data of 3,159 hospitals, and we used the occupational mix surveys of 2,955 hospitals for which we also had Worksheet S–3 wage data, which represented a ''response'' rate of 94 percent (2,955/3,159). For the proposed FY 2022 wage index, we are applying proxy data for noncompliant hospitals, new hospitals, or hospitals that submitted erroneous or aberrant data in the same manner that we applied proxy data for such hospitals in the FY 2012 wage index occupational mix adjustment (76 FR 51586). As a result of applying this methodology, the proposed FY 2022 occupational mix adjusted national average hourly wage is the following:

Proposed FY 2022 Occupational Mix Adjusted National Average Hourly Wage	$46.37

F. Analysis and Implementation of the Proposed Occupational Mix Adjustment and the Proposed FY 2022 Occupational Mix Adjusted Wage Index

As discussed in section III.E. of the preamble of this proposed rule, for FY 2022, we are applying the occupational mix adjustment to 100 percent of the FY 2022 wage index. We calculated the occupational mix adjustment using data from the 2019 occupational mix survey data, using the methodology described in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51582 through 51586).

The FY 2022 national average hourly wages for each occupational mix nursing subcategory as calculated in Step 2 of the occupational mix calculation are as follows:

Occupational Mix Nursing Subcategory	Average Hourly Wage
National RN	$44.29
National LPN and Surgical Technician	$26.80
National Nurse Aide, Orderly, and Attendant	$18.49
National Medical Assistant	$19.52
National Nurse Category	$37.34

The proposed national average hourly wage for the entire nurse category is computed in Step 5 of the occupational mix calculation. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of greater than the

national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of less than 1.0. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of less than the national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of greater than 1.0.

Based on the 2019 occupational mix survey data, we determined (in Step 7 of the occupational mix calculation) the following:

National Percentage of Hospital Employees in the Nurse Category	42%
National Percentage of Hospital Employees in the All Other Occupations Category	58%
Range of Percentage of Hospital Employees in the Nurse Category (CBSA Level)	Low of 20 Percent in one CBSA to a high of 66 percent in another CBSA

We compared the proposed FY 2022 occupational mix adjusted wage indexes for each CBSA to the proposed unadjusted wage indexes for each CBSA. Applying the occupational mix adjustment to the wage data resulted in the following:

Comparison of the FY 2022 Proposed Occupational Mix Adjusted Wage Indexes to the Proposed Unadjusted Wage Indexes by CBSA	
Number of Urban Areas Wage Index Increasing	226 (54.9%)
Number of Rural Areas Wage Index Increasing	27 (57.4%)
Number of Urban Areas Wage Index Increasing by Greater Than or Equal to 1 Percent But Less Than 5 Percent	122 (29.6 %)
Number of Urban Areas Wage Index Increasing by 5 percent or More	2 (0.5 %)
Number of Rural Areas Wage Index Increasing by Greater Than or Equal to 1 Percent But Less Than 5 percent	11 (23.4%)
Number of Rural Areas Wage Index Increasing by 5 Percent or More	0 (0 %)
Number of Urban Areas Wage Index Decreasing	185 (44.9 %)
Number of Rural Areas Wage Index Decreasing	20 (42.6 %)
Number of Urban Areas Wage Index Decreasing by Greater Than or Equal to 1 Percent But Less Than 5 percent	73 (17.7 %)
Number of Urban Areas Wage Index Decreasing by 5 Percent or More	2 (0.5 %)
Number of Rural Areas Wage Index Decreasing by Greater Than or Equal to 1 Percent But Less than 5 Percent	8(17 %)
Number of Rural Areas Wage Index Decreasing by 5 Percent or More	0 (0 %)
Largest Positive Impact for an Urban Area	5.8 %
Largest Positive Impact for a Rural Area	4.3 %
Largest Negative Impact for an Urban Area	5.4 %
Largest Negative Impact for a Rural Area	2.5 %
Urban Areas Unchanged by Application of the Occupational Mix Adjustment	1
Rural Areas Unchanged by Application of the Occupational Mix Adjustment	0

These results indicate that a smaller percentage of urban areas (54.9 percent) would benefit from the occupational mix adjustment than would rural areas (57.4 percent).

We also compared the FY 2022 wage data adjusted for occupational mix from the 2019 survey to the FY 2022 wage data adjusted for occupational mix from the 2016 survey. This analysis illustrates the effect on area wage indexes of using the 2019 survey data compared to the 2016 survey data; that is, it shows whether hospitals' wage indexes will increase or decrease under the 2019 survey data as compared to the prior 2016 survey data. Applying the occupational mix adjustment to the wage data, based on the 2019 survey, resulted in the following:

Comparison of the FY 2022 Proposed Occupational Mix Adjusted Wage Indexes: 2016 Survey to 2019 Survey	
Number of Urban Areas Wage Index Increasing	208 (50.5%)
Number of Rural Areas Wage Index Increasing	19 (40.4%)
Number of Urban Areas Wage Index Increasing by Greater Than or Equal to 1 Percent But Less Than 5 Percent	121 (29.4 %)
Number of Urban Areas Wage Index Increasing by 5 percent or More	18 (4.4 %)
Number of Rural Areas Wage Index Increasing by Greater Than or Equal to 1 Percent But Less Than 5 percent	9 (19.1%)
Number of Rural Areas Wage Index Increasing by 5 Percent or More	6 (6.4 %)
Number of Urban Areas Wage Index Decreasing	203 (49.3 %)
Number of Rural Areas Wage Index Decreasing	28 (59.6 %)
Number of Urban Areas Wage Index Decreasing by Greater Than or Equal to 1 Percent But Less Than 5 percent	110 (26.7 %)
Number of Urban Areas Wage Index Decreasing by 5 Percent or More	19 (4.6 %)
Number of Rural Areas Wage Index Decreasing by Greater Than or Equal to 1 Percent But Less than 5 Percent	19 (40.4 %)
Number of Rural Areas Wage Index Decreasing by 5 Percent or More	1 (2.1 %)
Largest Positive Impact for an Urban Area	14.9 %
Largest Positive Impact for a Rural Area	6.4 %
Largest Negative Impact for an Urban Area	10.7 %
Largest Negative Impact for a Rural Area	5.8 %
Urban Areas Unchanged by Application of the Occupational Mix Adjustment	0
Rural Areas Unchanged by Application of the Occupational Mix Adjustment	0

These results indicate that the wage indexes of 49.3 percent of CBSAs overall will decrease due to application of the 2019 occupational mix survey data as compared to the 2016 occupational mix survey data. Further, a larger percentage of urban areas (50.5 percent) will benefit from the use of the 2019 occupational mix survey data as compared to the 2016 occupational mix survey data than will rural areas (40.4 percent).

G. Application of the Rural Floor, Application of the State Frontier Floor, Continuation of the Low Wage Index Hospital Policy, and Proposed Budget Neutrality Adjustment

1. Rural Floor

Section 4410(a) of Public Law 105–33 provides that, for discharges on or after October 1, 1997, the area wage index applicable to any hospital that is located in an urban area of a State may not be less than the area wage index applicable to hospitals located in rural areas in that State. This provision is referred to as the rural floor. Section 3141 of Public Law 111–148 also requires that a national budget neutrality adjustment be applied in implementing the rural floor.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42332 through 42336), we removed urban to rural reclassifications from the calculation of the rural floor to prevent inappropriate payment increases under the rural floor due to rural reclassifications, such that, beginning in FY 2020, the rural floor is calculated without including the wage data of hospitals that have reclassified as rural under section 1886(d)(8)(E) of the Act (as implemented in the regulations at § 412.103). The rural floor for this FY 2022 proposed rule continues to be calculated without the wage data of hospitals that have reclassified as rural under § 412.103. We are not proposing any changes to the rural floor policy for FY 2022. Also, for the purposes of applying the provisions of section 1886(d)(8)(C)(iii) of the Act, effective beginning in FY 2020, we remove the data of hospitals reclassified from urban to rural under section 1886(d)(8)(E) of the Act (as implemented in the regulations at § 412.103) from the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act. We are not proposing any changes to this policy for FY 2022.

Based on the FY 2022 wage index associated with this proposed rule (which is available via the internet on the CMS website) and based on the calculation of the rural floor without the wage data of hospitals that have reclassified as rural under § 412.103, we estimate that 287 hospitals would receive an increase in their FY 2022 proposed wage index due to the application of the rural floor.

2. Imputed Floor

In the FY 2005 IPPS final rule (69 FR 49109 through 49111), we adopted the imputed floor policy as a temporary 3-year regulatory measure to address concerns from hospitals in all-urban States that have argued that they are disadvantaged by the absence of rural hospitals to set a wage index floor for those States. We extended the imputed floor policy eight times since its initial

implementation, the last of which was adopted in the FY 2018 IPPS/LTCH PPS final rule and expired on September 30, 2018. (We refer readers to further discussions of the imputed floor in the IPPS/LTCH PPS final rules from FYs 2014 through 2019 (78 FR 50589 through 50590, 79 FR 49969 through 49971, 80 FR 49497 through 49498, 81 FR 56921 through 56922, 82 FR 38138 through 38142, and 83 FR 41376 through 41380, respectively) and to the regulations at 42 CFR 412.64(h)(4).) For FYs 2019, 2020, and 2021, hospitals in all-urban states received a wage index that was calculated without applying an imputed floor, and we no longer included the imputed floor as a factor in the national budget neutrality adjustment.

In computing the imputed floor for an all-urban State under the original methodology established beginning in FY 2005, we calculated the ratio of the lowest-to-highest CBSA wage index for each all-urban State as well as the average of the ratios of lowest-to-highest CBSA wage indexes of those all-urban States. We then compared the State's own ratio to the average ratio for all-urban States and whichever was higher was multiplied by the highest CBSA wage index value in the State—the product of which established the imputed floor for the State.

We adopted a second, alternative methodology beginning in FY 2013 (77 FR 53368 through 53369) to address the concern that the original imputed floor methodology guaranteed a benefit for one all-urban State with multiple wage indexes (New Jersey) but could not benefit another all-urban State, Rhode Island, which had only one CBSA. Under the alternative methodology, we first determined the average percentage difference between the post-reclassified, pre-floor area wage index and the post-reclassified, rural floor wage index (without rural floor budget neutrality applied) for all CBSAs receiving the rural floor. The lowest post-reclassified wage index assigned to a hospital in an all-urban State having a range of such values then was increased by this factor, the result of which established the State's alternative imputed floor. Under the updated OMB labor market area delineations adopted by CMS beginning in FY 2015, Delaware became an all-urban State, along with New Jersey and Rhode Island, and was subject to an imputed floor as well. In addition, we adopted a policy, as reflected at § 412.64(h)(4)(vi), that, for discharges on or after October 1, 2012, and before October 1, 2018, the minimum wage index value for a State is the higher of the value determined under the original methodology or the value determined under the alternative methodology. The regulations implementing the imputed floor wage index, both the original methodology and the alternative methodology, were set forth at § 412.64(h)(4).

Section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2) enacted on March 11, 2021 amended section 1886(d)(3)(E)(i) of the Act (42 U.S.C. 1395ww(d)(3)(E)(i)) and added section 1886(d)(3)(E)(iv) of the Act to establish a minimum area wage index for hospitals in all-urban States for discharges occurring on or after October 1, 2021. Specifically, section 1886(d)(3)(E)(iv)(I) and (II) of the Act provides that for discharges occurring on or after October 1, 2021, the area wage index applicable to any hospital in an all-urban State may not be less than the minimum area wage index for the fiscal year for hospitals in that State established using the methodology described in § 412.64(h)(4)(vi) as in effect for FY 2018. Thus, effective beginning October 1, 2021 (FY 2022), section 1886(d)(3)(E)(iv) of the Act reinstates the imputed floor wage index policy for all-urban States, with no expiration date, using the methodology described in 42 CFR 412.64(h)(4)(vi) as in effect for FY 2018. As discussed previously, under § 412.64(h)(4)(vi), the minimum wage index value for hospitals in an all-urban State is the higher of the value determined using the original methodology (as set forth at § 412.64(h)(4)(i) through (v)) or the value determined using alternative methodology (as set forth at § 412.64(h)(4)(vi)(A) and (B)) for calculating an imputed floor. Therefore, as provided in § 412.64(h)(vi), we would apply the higher of the value determined under original or alternative methodology for calculating a minimum wage index, or imputed floor, for all-urban States effective beginning with FY 2022. We note that the rural floor values used in the alternative methodology at § 412.64(h)(4)(vi)(A) and (B) would not include the wage data of hospitals reclassified under § 412.103, because we currently calculate the rural floor without the wage data of such hospitals.

Unlike the imputed floor that was in effect from FYs 2005 through 2018, section 1886(d)(3)(E)(iv)(III) of the Act provides that the imputed floor wage index shall not be applied in a budget neutral manner. Specifically, section 9831(b) of Public Law 117–2 amends section 1886(d)(3)(E)(i) of the Act to exclude the imputed floor from the budget neutrality requirement under section 1886(d)(3)(E)(i) of the Act. In other words, the budget neutrality requirement under section 1886(d)(3)(E)(i) of the Act, as amended, must be applied without taking into account the imputed floor adjustment under section 1886(d)(3)(E)(iv) of the Act. When the imputed floor was in effect from FY 2005 through FY 2018, to budget neutralize the increase in payments resulting from application of the imputed floor, we calculated the increase in payments resulting from the imputed floor together with the increase in payments resulting from the rural floor and applied an adjustment to reduce the wage index. By contrast, for FY 2022 and subsequent years, we are proposing to apply the imputed floor after the application of the rural floor and to apply no reductions to the standardized amount or to the wage index to fund the increase in payments to hospitals in all-urban States resulting from the application of the imputed floor required under section 1886(d)(3)(E)(iv) of the Act.

We note, given the recent enactment of section 9831 of Public Law 117–2 on March 11, 2021, there was not sufficient time available to incorporate the changes required by this statutory provision (which provides for the application of the imputed floor adjustment in a non-budget neutral manner beginning in FY 2022) into the calculation of the provider wage index for this proposed rule. We will include the imputed floor adjustment in the calculation of the provider wage index in the FY 2022 final rule. We note that CMS has posted, concurrent with the issuance of this proposed rule, estimated imputed floor values by state in a separate data file on the FY 2022 IPPS Proposed Rule web page on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index,* and an aggregate payment impact for the imputed floor in the Appendix to this proposed rule.

The imputed floor under section 1886(d)(3)(E)(iv) of the Act applies to all-urban States, as defined in new subclause (IV). Section 1886(d)(3)(E)(iv)(IV) provides that, for purposes of the imputed floor wage index under clause (iv), the term all-urban State means a State in which there are no rural areas (as defined in section 1886(d)(2)(D) of the Act) or a State in which there are no hospitals classified as rural under section 1886 of the Act. Under this definition, given that it applies for purposes of the imputed floor wage index, we believe it would be appropriate to consider a hospital to be classified as rural under section 1886 of the Act if it is assigned the State's rural area wage index value.

Therefore, under the definition at section 1886(d)(3)(E)(iv)(IV) of the Act, ''a State in which there are no hospitals classified as rural under this section'' would include a State that has a rural area but no hospitals that receive the rural area wage index under section 1886(d) of the Act. For purposes of this definition, hospitals redesignated as rural under section 1886(d)(8)(E) of the Act (412.103 rural reclassifications) would be considered classified as rural if they receive the rural wage index; however, hospitals that are deemed urban under section 1886(d)(8)(B) of the Act (in Lugar counties), or are reclassified to an urban area under section 1886(d)(10) of the Act (MGCRB reclassifications) would not be considered classified as rural because they do not receive the rural wage index. In contrast, we note that in the imputed floor policy in effect from FY 2005 through FY 2018, we did not consider a State to qualify for ''all urban status'' if there were one or more hospitals geographically located in the rural area of the State, even if all such hospitals subsequently reclassified to receive an urban area wage index. There is currently one State, Connecticut, that would be eligible for the imputed floor under this qualification in this proposed rule because there are currently no hospitals in Connecticut that are classified as rural under section 1886(d) for purposes of the wage index—in other words, there are no hospitals that receive the rural wage index value. There is one rural county in Connecticut. All hospitals in this county are either deemed urban under section 1886(d)(8)(B) of the Act or receive an MGCRB reclassification under section 1886(d)(10) of the Act. While several Connecticut hospitals were approved for rural reclassification under section 1886(d)(8)(E) of the Act, at this point in time, all have received a subsequent urban reclassification under section 1886(d)(10) of the Act.

Additionally, under section 1861(x) of the Act, the term State has the meaning given to it in section 210(h) of the Act. Because section 210(h) of the Act defines the word State to also include the District of Columbia and the Commonwealth of Puerto Rico, Washington, DC and Puerto Rico may also qualify as all-urban States for purposes of the imputed floor if the requirements of section 1886(d)(3)(E)(iv)(IV) of the Act are met. Based on data available for this proposed rule, the following States would be all-urban States as defined in section 1886(d)(3)(E)(iv)(IV) of the Act, and thus hospitals in such States would be eligible to receive an increase in their wage index due to application of the imputed floor for FY 2022: New Jersey, Rhode Island, Delaware, Connecticut, and Washington, DC.

We are proposing to revise the regulations at § 412.64(e)(1) and (4) and (h)(4) and (5) to implement the imputed floor required by section 1886(d)(3)(E)(iv) of the Act for discharges occurring on or after October 1, 2021. First, we propose to make the following revisions to the regulation text to specify that the imputed floor required under section 1886(d)(3)(E)(iv) of the Act would not be applied in a budget neutral manner:

- We are proposing to revise the introductory language at § 412.64(e)(4) to state that the budget neutrality adjustment for the imputed floor under paragraph (h)(4) applies only to discharges on or after October 1, 2004 and before October 1, 2018.
- We are proposing a conforming revision to § 412.64(e)(1)(ii) to refer to § 412.64(h)(4)(vii) (proposed in this proposed rule) in the introductory phrase that excepts certain provisions from the budget neutrality requirement specified in paragraph (e)(1)(ii).
- We are proposing to revise § 412.64(h)(4) to add a new clause (vii) stating that, for discharges on or after October 1, 2021, the minimum wage index computed under this paragraph may not be applied in a budget neutral manner.

In addition, we are proposing to revise the introductory language at § 412.64(h)(4) to specify that the minimum wage index and methodology described in that paragraph also apply for discharges on or after October 1, 2021. Further, we are proposing to revise § 412.64(h)(4)(vi) to specify that this clause also applies to discharges on or after October 1, 2021.

Finally, we are proposing to make the following revisions to § 412.64(h)(5). First, we are proposing to redesignate the current language at § 412.64(h)(5) as § 412.64(h)(5)(i) and to revise this language to reflect that it applies for purposes of applying the imputed floor for discharges on or after October 1, 2004 and before October 1, 2018. Second, we are proposing to add a new clause (ii) to § 412.64(h)(5) to reflect the proposed definition of all-urban State for purposes of applying the imputed floor for discharges on or after October 1, 2021, as previously discussed. Specifically, we are proposing at § 412.64(h)(5)(ii) that, for purposes of applying the imputed floor for discharges on or after October 1, 2021, an all-urban State is a State with no rural areas, as defined in § 412.64, or a State in which there are no hospitals classified as rural under section 1886 of the Act. We are further proposing at § 412.64(h)(5)(ii) that a hospital would be considered classified as rural under section 1886 of the Act if it is assigned the State's rural area wage index value.

3. State Frontier Floor for FY 2022

Section 10324 of Public Law 111–148 requires that hospitals in frontier States cannot be assigned a wage index of less than 1.0000. (We refer readers to the regulations at 42 CFR 412.64(m) and to a discussion of the implementation of this provision in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50160 through 50161).) In this FY 2022 IPPS/LTCH PPS proposed rule, we are not proposing any changes to the frontier floor policy for FY 2022. In this proposed rule, 44 hospitals would receive the frontier floor value of 1.0000 for their FY 2022 proposed wage index. These hospitals are located in Montana, North Dakota, South Dakota, and Wyoming. We note that while Nevada meets the criteria of a frontier State, all hospitals within the State currently receive a wage index value greater than 1.0000.

The areas affected by the rural and frontier floor policies for the proposed FY 2022 wage index are identified in Table 2 associated with this proposed rule, which is available via the internet on the CMS website.

4. Continuation of the Low Wage Index Hospital Policy; Proposed Budget Neutrality Adjustment

To help mitigate wage index disparities, including those resulting from the inclusion of hospitals with rural reclassifications under 42 CFR 412.103 in the rural floor, in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42325 through 42339), we finalized policies to reduce the disparity between high and low wage index hospitals by increasing the wage index values for certain hospitals with low wage index values and doing so in a budget neutral manner through an adjustment applied to the standardized amounts for all hospitals, as well as by changing the calculation of the rural floor. We also provided for a transition in FY 2020 for hospitals experiencing significant decreases in their wage index values as compared to their final FY 2019 wage index, and made these changes in a budget neutral manner.

We increase the wage index for hospitals with a wage index value below the 25th percentile wage index value for a fiscal year by half the difference between the otherwise applicable final wage index value for a year for that

hospital and the 25th percentile wage index value for that year across all hospitals (the low wage index hospital policy). We stated in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42326 through 42328) that this policy will be effective for at least 4 years, beginning in FY 2020, in order to allow employee compensation increases implemented by these hospitals sufficient time to be reflected in the wage index calculation. Therefore, the policy will continue in FY 2022. In order to offset the estimated increase in IPPS payments to hospitals with wage index values below the 25th percentile wage index value, for FY 2022 and for subsequent fiscal years during which the low wage index hospital policy is in effect, we are proposing to apply a budget neutrality adjustment in the same manner as we applied it in FY 2021, as a uniform budget neutrality factor applied to the standardized amount. We refer readers to section II.A.4.b.of the addendum to this proposed rule for further discussion of the budget neutrality adjustment for FY 2022. For purposes of the low wage index hospital policy, based on the data for this proposed rule, the table below displays the 25th percentile wage index value across all hospitals for FY 2022.

FY 2022 Proposed 25th Percentile Wage Index Value	0.8418

H. Proposed FY 2022 Wage Index Tables

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49498 and 49807 through 49808), we finalized a proposal to streamline and consolidate the wage index tables associated with the IPPS proposed and final rules for FY 2016 and subsequent fiscal years. Effective beginning FY 2016, with the exception of Table 4E, we streamlined and consolidated 11 tables (Tables 2, 3A, 3B, 4A, 4B, 4C, 4D, 4F, 4J, 9A, and 9C) into 2 tables (Tables 2 and 3). In this FY 2022 IPPS/LTCH PPS proposed rule, as provided beginning with the FY 2021 IPPS/LTCH PPS final rule, we have included Table 4A which is titled ''List of Counties Eligible for the Out-Migration Adjustment under Section 1886(d)(13) of the Act'' and Table 4B titled ''Counties redesignated under section 1886(d)(8)(B) of the Act (Lugar Counties).'' We refer readers to section VI. of the Addendum to this proposed rule for a discussion of the wage index tables for FY 2022.

I. Proposed Revisions to the Wage Index Based on Hospital Redesignations and Reclassifications

1. General Policies and Effects of Reclassification and Redesignation

Under section 1886(d)(10) of the Act, the Medicare Geographic Classification Review Board (MGCRB) considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. Hospitals must apply to the MGCRB to reclassify not later than 13 months prior to the start of the fiscal year for which reclassification is sought (usually by September 1). We note that this deadline was extended for applications for FY 2022 reclassifications to 15 days after the public display date of the FY 2021 IPPS/LTCH final rule at the Office of the Federal Register, using our authority under Section 1135(b)(5) the Act due to the COVID–19 Public Health Emergency. Generally, hospitals must be proximate to the labor market area to which they are seeking reclassification and must demonstrate characteristics similar to hospitals located in that area. The MGCRB issues its decisions by the end of February for reclassifications that become effective for the following fiscal year (beginning October 1). The regulations applicable to reclassifications by the MGCRB are located in 42 CFR 412.230 through 412.280. (We refer readers to a discussion in the FY 2002 IPPS final rule (66 FR 39874 and 39875) regarding how the MGCRB defines mileage for purposes of the proximity requirements.) The general policies for reclassifications and redesignations and the policies for the effects of hospitals' reclassifications and redesignations on the wage index are discussed in the FY 2012 IPPS/LTCH PPS final rule for the FY 2012 final wage index (76 FR 51595 and 51596). We note that rural hospitals reclassifying under the MGCRB to another State's rural area are not eligible for the rural floor, because the rural floor may apply only to urban, not rural, hospitals.

In addition, in the FY 2012 IPPS/LTCH PPS final rule, we discussed the effects on the wage index of urban hospitals reclassifying to rural areas under 42 CFR 412.103. In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42332 through 42336), we finalized a policy to exclude the wage data of urban hospitals reclassifying to rural areas under 42 CFR 412.103 from the calculation of the rural floor. Hospitals that are geographically located in States without any rural areas are ineligible to apply for rural reclassification in accordance with the provisions of 42 CFR 412.103.

On April 21, 2016, we published an interim final rule with comment period (IFC) in the **Federal Register** (81 FR 23428 through 23438) that included provisions amending our regulations to allow hospitals nationwide to have simultaneous § 412.103 and MGCRB reclassifications. For reclassifications effective beginning FY 2018, a hospital may acquire rural status under § 412.103 and subsequently apply for a reclassification under the MGCRB using distance and average hourly wage criteria designated for rural hospitals. In addition, we provided that a hospital that has an active MGCRB reclassification and is then approved for redesignation under § 412.103 will not lose its MGCRB reclassification; such a hospital receives a reclassified urban wage index during the years of its active MGCRB reclassification and is still considered rural under section 1886(d) of the Act and for other purposes.

We discussed that when there is both a § 412.103 redesignation and an MGCRB reclassification, the MGCRB reclassification controls for wage index calculation and payment purposes. We exclude hospitals with § 412.103 redesignations from the calculation of the reclassified rural wage index if they also have an active MGCRB reclassification to another area. That is, if an application for urban reclassification through the MGCRB is approved, and is not withdrawn or terminated by the hospital within the established timelines, we consider the hospital's geographic CBSA and the urban CBSA to which the hospital is reclassified under the MGCRB for the wage index calculation. We refer readers to the April 21, 2016 IFC (81 FR 23428 through 23438) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 56922

through 56930) for a full discussion of the effect of simultaneous reclassifications under both the § 412.103 and the MGCRB processes on wage index calculations. For a discussion on the effects of reclassifications under § 412.103 on the rural area wage index and the calculation of the rural floor, we refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42332 through 42336).

We refer readers to the interim final rule with comment period (IFC) (CMS–1762–IFC) simultaneously submitted for public inspection with this proposed rule and published elsewhere in this issue of the **Federal Register** implementing the court's decision in *Bates Cnty. Mem'l Hosp.(''Bates'')* v. *Azar* for further changes to the treatment of § 412.103 hospitals reclassifying under the MGCRB.

2. MGCRB Reclassification and Redesignation Issues for FY 2022

a. FY 2022 Reclassification Application Requirements and Approvals

As previously stated, under section 1886(d)(10) of the Act, the MGCRB considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. The specific procedures and rules that apply to the geographic reclassification process are outlined in regulations under 42 CFR 412.230 through 412.280. At the time this proposed rule was drafted, the MGCRB had completed its review of FY 2022 reclassification requests. Based on such reviews, there are 496 hospitals approved for wage index reclassifications by the MGCRB starting in FY 2022. Because MGCRB wage index reclassifications are effective for 3 years, for FY 2022, hospitals reclassified beginning in FY 2020 or FY 2021 are eligible to continue to be reclassified to a particular labor market area based on such prior reclassifications for the remainder of their 3-year period. There were 245 hospitals approved for wage index reclassifications in FY 2020 that will continue for FY 2022, and 317 hospitals approved for wage index reclassifications in FY 2021 that will continue for FY 2022. Of all the hospitals approved for reclassification for FY 2020, FY 2021, and FY 2022, based upon the review at the time of this proposed rule, 1,058 hospitals are in a MGCRB reclassification status for FY 2022 (with 161 of these hospitals reclassified back to their geographic location).

Under the regulations at 42 CFR 412.273, hospitals that have been reclassified by the MGCRB are permitted to withdraw their applications if the request for withdrawal is received by the MGCRB any time before the MGCRB issues a decision on the application, or after the MGCRB issues a decision, provided the request for withdrawal is received by the MGCRB within 45 days of the date that CMS' annual notice of proposed rulemaking is issued in the **Federal Register** concerning changes to the inpatient hospital prospective payment system and proposed payment rates for the fiscal year for which the application has been filed. For information about withdrawing, terminating, or canceling a previous withdrawal or termination of a 3-year reclassification for wage index purposes, we refer readers to § 412.273, as well as the FY 2002 IPPS final rule (66 FR 39887 through 39888) and the FY 2003 IPPS final rule (67 FR 50065 through 50066). Additional discussion on withdrawals and terminations, and clarifications regarding reinstating reclassifications and ''fallback'' reclassifications were included in the FY 2008 IPPS final rule (72 FR 47333) and the FY 2018 IPPS/LTCH PPS final rule (82 FR 38148 through 38150).

Finally, we note that in the FY 2021 IPPS/LTCH final rule (85 FR 58771–58778), CMS finalized an assignment policy for hospitals reclassified to CBSAs from which one or more counties moved to a new or different urban CBSA under the revised OMB delineations based on OMB Bulletin 18–04. We provided a table in that rule (85 FR 58777 and 58778) which described the assigned CBSA for all the MGCRB cases subject to this policy. For such reclassifications that continue to be active or are reinstated for FY 2022 (and FY 2023, if applicable), the CBSAs assigned in the FY 2021 IPPS/LTCH final rule continue to be in effect.

b. Proposed Revisions to the Regulations at § 412.278 for Administrator's Review

The regulation at § 412.278(b) addresses the procedure for a hospital's request for the Administrator's review of an MGCRB decision. In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58788), we eliminated the prohibition on submitting a request by facsimile or other electronic means so that hospitals may also submit requests for Administrator review of MGCRB decisions electronically. In addition, we updated the regulation at § 412.278(b)(1) to require the hospital to submit an electronic copy of its request for review to CMS's Hospital and Ambulatory Policy Group. We specified that copies to CMS' Hospital and Ambulatory Policy Group should be submitted via email to wage *index@cms.hhs.gov*. In this proposed rule, we are proposing to further revise the regulation at § 412.278(b)(1) to specify that the hospital's request for review must be in writing and sent to the Administrator, in care of the Office of the Attorney Advisor, in the manner directed by the Office of the Attorney Advisor. We believe that this additional language would provide clarity and specificity by addressing any changes to the future technology platform for submission of the hospital's request for Administrator review. Hospitals will continue to be notified of the procedure for requesting Administrator review in the decision letters issued by the MGCRB.

The regulation at § 412.278(f)(2) addresses the timing for the Administrator's decision. Specifically, the Administrator issues a decision in writing to the party with a copy to CMS not later than 90 calendar days following the receipt of the party's request for review (§ 412.278(f)(2)(i)), or not later than 105 calendar days following issuance of the MGCRB decision in the case of review at the discretion of the Administrator (§ 412.278(f)(2)(ii)). While the regulation at § 412.278(f)(2)(i) allows the Administrator to toll the 90 day timeframe for good cause, the regulation at § 412.278(f)(2)(ii) does not expressly provide for tolling the 105 day timeframe in the case of review at the discretion of the Administrator. We believe the policy regarding tolling should be the same regardless of whether the Administrator exercises review at the request of the hospital or at her discretion. Therefore, we are proposing to also provide for tolling of the 105 day timeframe at § 412.278(f)(2)(ii). Specifically, we are proposing to revise § 412.278(f)(2)(ii) to state that the Administrator issues a decision in writing to the party with a copy to CMS not later than 105 days following issuance of the MGCRB decision in the case of review at the discretion of the Administrator, except the Administrator may, at his or her discretion, for good cause shown, toll such 105 days.

3. Redesignations Under Section 1886(d)(8)(B) of the Act (Lugar Status Determinations)

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600), we adopted the policy that, beginning with FY 2012, an eligible hospital that waives its Lugar status in order to receive the out-migration adjustment has effectively waived its deemed urban status and, thus, is rural for all purposes under the IPPS effective for the fiscal year in which the hospital receives the outmigration adjustment. In addition, in

that rule, we adopted a minor procedural change that would allow a Lugar hospital that qualifies for and accepts the out-migration adjustment (through written notification to CMS within 45 days from the publication of the proposed rule) to waive its urban status for the full 3-year period for which its out-migration adjustment is effective. By doing so, such a Lugar hospital would no longer be required during the second and third years of eligibility for the out-migration adjustment to advise us annually that it prefers to continue being treated as rural and receive the out-migration adjustment. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56930), we further clarified that if a hospital wishes to reinstate its urban status for any fiscal year within this 3-year period, it must send a request to CMS within 45 days of publication of the proposed rule for that particular fiscal year. We indicated that such reinstatement requests may be sent electronically to *wageindex@cms.hhs.gov*. In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38147 through 38148), we finalized a policy revision to require a Lugar hospital that qualifies for and accepts the out-migration adjustment, or that no longer wishes to accept the out-migration adjustment and instead elects to return to its deemed urban status, to notify CMS within 45 days from the date of public display of the proposed rule at the Office of the Federal Register. These revised notification timeframes were effective beginning October 1, 2017. In addition, in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38148), we clarified that both requests to waive and to reinstate ''Lugar'' status may be sent to *wageindex@cms.hhs.gov*. To ensure proper accounting, we request hospitals to include their CCN, and either ''waive Lugar'' or ''reinstate Lugar'', in the subject line of these requests.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42314 and 42315), we clarified that in circumstances where an eligible hospital elects to receive the outmigration adjustment within 45 days of the public display date of the proposed rule at the Office of the Federal Register in lieu of its Lugar wage index reclassification, and the county in which the hospital is located would no longer qualify for an out-migration adjustment when the final rule (or a subsequent correction notice) wage index calculations are completed, the hospital's request to accept the outmigration adjustment would be denied, and the hospital would be automatically assigned to its deemed urban status under section 1886(d)(8)(B) of the Act. We stated that final rule wage index values would be recalculated to reflect this reclassification, and in some instances, after taking into account this reclassification, the out-migration adjustment for the county in question could be restored in the final rule. However, as the hospital is assigned a Lugar reclassification under section 1886(d)(8)(B) of the Act, it would be ineligible to receive the county outmigration adjustment under section 1886(d)(13)(G) of the Act.

J. Proposed Out-Migration Adjustment Based on Commuting Patterns of Hospital Employees

In accordance with section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, beginning with FY 2005, we established a process to make adjustments to the hospital wage index based on commuting patterns of hospital employees (the ''out-migration'' adjustment). The process, outlined in the FY 2005 IPPS final rule (69 FR 49061), provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county but work in a different county (or counties) with a higher wage index.

Section 1886(d)(13)(B) of the Act requires the Secretary to use data the Secretary determines to be appropriate to establish the qualifying counties. When the provision of section 1886(d)(13) of the Act was implemented for the FY 2005 wage index, we analyzed commuting data compiled by the U.S. Census Bureau that were derived from a special tabulation of the 2000 Census journey-to-work data for all industries (CMS extracted data applicable to hospitals). These data were compiled from responses to the ''long-form'' survey, which the Census Bureau used at that time and which contained questions on where residents in each county worked (69 FR 49062). However, the 2010 Census was ''short form'' only; information on where residents in each county worked was not collected as part of the 2010 Census. The Census Bureau worked with CMS to provide an alternative dataset based on the latest available data on where residents in each county worked in 2010, for use in developing a new outmigration adjustment based on new commuting patterns developed from the 2010 Census data beginning with FY 2016.

To determine the out-migration adjustments and applicable counties for FY 2016, we analyzed commuting data compiled by the Census Bureau that were derived from a custom tabulation of the American Community Survey (ACS), an official Census Bureau survey, utilizing 2008 through 2012 (5-year) Microdata. The data were compiled from responses to the ACS questions regarding the county where workers reside and the county to which workers commute. As we discussed in prior IPPS/LTCH PPS final rules, most recently in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58787), we have applied the same policies, procedures, and computations since FY 2012. We are proposing to use them again for FY 2022, as we believe they continue to be appropriate. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49500 through 49502) for a full explanation of the revised data source.

For FY 2022, the out-migration adjustment will continue to be based on the data derived from the custom tabulation of the ACS utilizing 2008 through 2012 (5-year) Microdata. For future fiscal years, we may consider determining out-migration adjustments based on data from the next Census or other available data, as appropriate. For FY 2022, we are not proposing any changes to the methodology or data source that we used for FY 2016 (81 FR 25071). (We refer readers to a full discussion of the out-migration adjustment, including rules on deeming hospitals reclassified under section 1886(d)(8) or section 1886(d)(10) of the Act to have waived the out-migration adjustment, in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51601 through 51602).)

Table 2 associated with this proposed rule (which is available via the internet on the CMS website) includes the proposed out-migration adjustments for the FY 2022 wage index. In addition, Table 4A associated with this proposed rule, ''List of Counties Eligible for the Out-Migration Adjustment under Section 1886(d)(13) of the Act'' (also available via the internet on the CMS website) consists of the following: A list of counties that are eligible for the out-migration adjustment for FY 2022 identified by FIPS county code, the proposed FY 2022 out-migration adjustment, and the number of years the adjustment will be in effect.

K. Reclassification From Urban to Rural Under Section 1886(d)(8)(E) of the Act Implemented at 42 CFR 412.103

1. Application for Rural Status and Lock-In Date

Under section 1886(d)(8)(E) of the Act, a qualifying prospective payment hospital located in an urban area may

apply for rural status for payment purposes separate from reclassification through the MGCRB. Specifically, section 1886(d)(8)(E) of the Act provides that, not later than 60 days after the receipt of an application (in a form and manner determined by the Secretary) from a subsection (d) hospital that satisfies certain criteria, the Secretary shall treat the hospital as being located in the rural area (as defined in paragraph (2)(D)) of the State in which the hospital is located. We refer readers to the regulations at 42 CFR 412.103 for the general criteria and application requirements for a subsection (d) hospital to reclassify from urban to rural status in accordance with section 1886(d)(8)(E) of the Act. The FY 2012 IPPS/LTCH PPS final rule (76 FR 51595 through 51596) includes our policies regarding the effect of wage data from reclassified or redesignated hospitals. We refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42332 through 42336) for a discussion on our current policy to calculate the rural floor without the wage data of urban hospitals reclassifying to rural areas under 42 CFR 412.103.

Because the wage index is part of the methodology for determining the prospective payments to hospitals for each fiscal year, we stated in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56931) that we believed there should be a definitive timeframe within which a hospital must apply for rural status in order for the reclassification to be reflected in the next Federal fiscal year's wage data used for setting payment rates. Therefore, in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56931 through 56932), we revised § 412.103(b) by adding paragraph (6) to add a lock-in date by which a hospital's application for rural status must be filed in order to be treated as rural in the wage index and budget neutrality calculations for payment rates for the next Federal fiscal year. In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41384 through 41386), we changed the lock-in date to provide for additional time in the ratesetting process and to match the lock-in date with another existing deadline, the usual public comment deadline for the IPPS proposed rule. We revised § 412.103(b)(6) to specify that, in order for a hospital to be treated as rural in the wage index and budget neutrality calculations under § 412.64(e)(1)(ii), (e)(2) and (4), and (h) for payment rates for the next Federal fiscal year, the hospital's application must be approved by the CMS Regional Office in accordance with the requirements of § 412.103 no later than 60 days after the public display date at the Office of the Federal Register of the IPPS proposed rule for the next Federal fiscal year.

The lock-in date does not affect the timing of payment changes occurring at the hospital-specific level as a result of reclassification from urban to rural under § 412.103. As we discussed in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56931) and the FY 2019 IPPS/LTCH PPS final rule (83 FR 41385 through 41386), this lock-in date also does not change the current regulation that allows hospitals that qualify under § 412.103(a) to request, at any time during a cost reporting period, to reclassify from urban to rural. A hospital's rural status and claims payment reflecting its rural status continue to be effective on the filing date of its reclassification application, which is the date the CMS Regional Office receives the application, in accordance with § 412.103(d). The hospital's IPPS claims will be paid reflecting its rural status beginning on the filing date (the effective date) of the reclassification, regardless of when the hospital applies.

2. Proposed Changes to Cancellation Requirements at § 412.103(g)

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42322), we noted that if an application is approved by the CMS Regional Office after our ratesetting lock-in date, the final rule rural wage index value would most likely not include the data for this hospital in the ratesetting calculation. Therefore, we noted that this may incentivize relatively low wage index hospitals to time their applications to avoid reducing the State's rural wage index. These hospitals could then conceivably cancel their rural reclassifications (effective for next FY), and then reapply again after the 'lock-in date.' We stated in the FY 2020 IPPS/LTCH PPS final rule that we planned to monitor this situation over the course of FY 2020, and determine if it is necessary to take action to prevent this type of gaming in future rulemaking.

We stated in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58788) that hospitals in certain states were indeed timing their rural reclassifications and applications to exploit the rural reclassification process in order to obtain higher wage index values. For example, for FY 2020, at least twenty-one hospitals in one State obtained § 412.103 rural reclassifications after the FY 2020 lock-in date, effectively receiving their State's rural wage index without having their wage data included, which would have lowered their State's rural wage index. These hospitals then requested to cancel their § 412.103 rural reclassifications effective for FY 2021, in accordance with § 412.103(g)(3). Similarly, five hospitals in another State, hospitals with wage data that would have lowered their State's FY 2021 rural wage index, requested to cancel their § 412.103 rural reclassifications for FY 2021, so that the rural wage index would be set using the data of one geographically rural hospital and two hospitals reclassified under § 412.103 that withdrew their MGCRB reclassifications for FY 2021. All five of these hospitals that withdrew their rural reclassification effective October 1, 2021 have since reapplied and been approved for rural reclassification. At least a dozen additional hospitals in this State were also approved for rural reclassification during FY 2021. By timing their applications to be approved after the lock-in date, these hospitals are receiving a higher rural wage index without having their own data included in the rural wage index calculation. We believe this practice of applying for and canceling rural reclassification to manipulate a State's rural wage index is detrimental to the stability and the accuracy of the Medicare wage index system.

In the FY 2008 IPPS/LTCH final rule (72 FR 47371 through 47373), CMS addressed an issue of hospitals applying for rural reclassification and then requesting cancelation soon after approval. Certain hospitals were using rural reclassifications to obtain RRC status, then canceling their rural reclassification so they could obtain an MGCRB reclassification, and using their prior RRC status in order to benefit from favorable MGCRB reclassification rules. To address this, CMS finalized a policy that required such hospitals to maintain rural status for one full cost reporting year before their rural reclassification could be canceled (cancelation was not effective until the hospital had been paid as rural for at least one 12-month cost-reporting period, and not until the beginning of the FY following the request for cancelation and the 12-month cost reporting period (§ 412.103(g)(2)(ii)). As discussed in the FY 2008 IPPS/LTCH proposed rule (72 FR 24812), we stated that we believed this policy was reasonable, given that acquired rural status for IPPS hospitals should be a considered decision for hospitals that truly wish to be considered as rural, and not purely as a mechanism for reclassifying. In the April 21, 2016 interim final rule with comment period (81 FR 23428 through 23438)), CMS implemented provisions amending our regulations to allow

hospitals nationwide to have simultaneous § 412.103 and MGCRB reclassifications. In the FY 2020 IPPS/LTCH final rule (42320 through 42321), CMS removed the requirement that RRCs must be paid as rural for one cost reporting year before canceling rural reclassification, as there no longer was an incentive to obtain and then cancel rural reclassification status to obtain an MGCRB reclassification. However, given our observations over the past two fiscal years of a new form of wage index gaming, as described in the previous paragraph, we believe it is necessary and appropriate to adopt a similar measure to prevent rural reclassifications from being used purely as a mechanism for statewide wage index manipulation.

Specifically, we are proposing that requests to cancel rural reclassifications must be submitted to the CMS Regional Office not earlier than one calendar year after the reclassification effective date. For example, a hospital that was approved to receive a rural reclassification effective October 1, 2021 would not be eligible to request cancelation until October 1, 2022. We are also proposing an additional modification to the effective date of these cancelation requests. Currently, all rural reclassification requests must be submitted not less than 120 days before the end of a fiscal year (that is, assuming the fiscal year ends on September 30th, no cancellation requests may be submitted after June 2nd and before October 1st). This timeframe typically aligns closely with the rural reclassification lock-in date under § 412.103(b)(6) (the hospital's rural reclassification application must be approved by the CMS Regional Office no later than 60 days after the public display date of the IPPS/LTCH PPS proposed rule at the Office of the Federal Register in order for a hospital to be treated as rural in the wage index and budget neutrality calculations for the next Federal fiscal year). The lock-in date and the 120 day cancelation deadline provide timeframes within which a hospital must be approved for rural reclassification (to have its rural status included in the wage index and budget neutrality calculations for the next fiscal year) or request cancelation of rural status, respectively, and also give CMS adequate time to incorporate these changes in the wage index and budget neutrality calculations under § 412.64(e)(1)(ii), (e)(2) and (4), and (h) for payment rates for the next Federal fiscal year. Rural reclassifications are effective as of the date the application is received (§ 412.103(b)(5), (d)), and CMS Regional Offices are required to render a determination within 60 days of receipt of the application (§ 412.103(c)). We believe that even with the proposed one-year minimum reclassification period before cancelation can be requested, there still would be a possibility that hospitals could time their applications around the lock-in date and 120 day deadline to continue to manipulate the State's rural wage index calculation. For example, assuming the lock-in date for a given year was May 30th (that is, the date by which the Regional Office must approve the application in order for the rural reclassification to be included in the wage index and budget neutrality calculations for the upcoming fiscal year), a hospital may choose to apply for rural reclassification on May 25th, virtually assuring that it could not be approved in time to be considered for wage index development purposes for the upcoming fiscal year. Assuming our one-year minimum reclassification period proposal is finalized, the hospital could request cancelation on May 25th the following year. Since that date would be prior to 120 day cancelation deadline, a hospital could once again cancel its rural reclassification, then reapply for rural reclassification status, and once again receive the rural wage index for the upcoming fiscal year while excluding its own wage data from the calculation. To address this rural wage index manipulation, we are proposing to eliminate the current rule at § 412.103(g)(3) (that cancelation must be requested 120 days prior to the end of the fiscal year and is effective beginning with the next fiscal year) and replace it with a policy that ensures that a hospital approved for rural reclassification (and that does not receive an additional reclassification) would have its data included in the calculation of the rural wage index for at least one Federal fiscal year before the rural reclassification status could be canceled. Specifically, we are proposing to make cancellation requests effective for the Federal fiscal year that begins in the calendar year after the calendar year in which the cancelation request is submitted. For example, we are proposing that a cancelation request submitted on December 31, 2021 would be effective October 1, 2022. But a cancellation request submitted one day later on January 1, 2022 would not become effective until October 1, 2023.

Specifically, we are proposing to add 412.103(g)(4) to state that for all written requests submitted by hospitals on or after October, 1, 2021 to cancel rural reclassifications, a hospital may cancel its rural reclassification by submitting a written request to the CMS Regional Office not less than 1 calendar year after the effective date of the rural reclassification. The hospital's cancellation of its rural reclassification would be effective beginning the Federal fiscal year that begins in the calendar year following the calendar year in which the cancelation request is submitted. We are also proposing to make conforming revisions to § 412.103(g)(3) to reflect that the rule in § 412.103(g)(3) applies to requests for cancelation of rural reclassification submitted on or after October 1, 2019 and before October 1, 2021.

We considered an alternative policy to increase the current 120 day cancelation deadline to a sufficient number of days to ensure that hospitals could not time applications and cancelations to straddle the lock-in date. Given the floating nature of the lock-in date due to the publication of the proposed rule varying year to year, it is difficult to determine how long that period would need to be in order to ensure our policy goals of preventing rural wage index manipulation are met. We acknowledge that our proposals would increase the amount of time a hospital must retain rural reclassification before it could cancel that status. However, we do not believe these proposed changes would have an undue impact on hospitals. In the FY 2021 final rule, 81 percent of hospitals with rural reclassifications were assigned a wage index based on an MGCRB or ''Lugar'' reclassification, and would not receive a wage index based on their rural reclassification.[933] Another 11 percent received a rural wage index value that was greater than or equal to their geographically urban area. Since these hospitals are typically benefiting by maintaining rural reclassification status, we do not believe they would be negatively affected by our proposals. More than half of the remaining 9 percent of hospitals with rural reclassifications do so to maintain MDH or SCH status. These special statuses convey additional financial benefits to hospitals and are not typically or routinely canceled by hospitals. We note that in the FY 2008 IPPS/LTCH final rule (72 FR 47372), we addressed a comment that expressed concern that the proposed requirement that a hospital must maintain rural status for at least a full 12 months could adversely affect hospitals with SCH

[933] ''Lugar'' hospitals may reclassify as rural and retain the urban wage index deemed under section 1886(d)(8)(B) of the Act, as discussed in the FY 2017 IPPS/LTCH final rule (81 FR 56929).

status since the payment rate as a rural SCH may be only slightly higher than the urban Federal rate. Since the form of wage index manipulation addressed by the proposed policy in FY 2008 specifically involved hospitals acquiring rural status to become RRCs, CMS opted to limit the policy finalized in FY 2008 to RRCs only. By contrast, the form of wage index manipulation we are addressing in this proposed rule is not limited to any specific hospital type. Therefore, we believe it is appropriate to apply it to all hospitals with rural reclassification status. We believe the proposed policy of requiring that rural reclassification be in effect for at least one year before cancelation can be requested, and the proposed policy to make rural reclassification cancelations effective beginning the Federal fiscal year that begins in the calendar year after the calendar year in which the cancelation request is submitted would reduce the instances of wage index manipulation described previously, as well as reduce volatility and promote accuracy in overall wage index values by ensuring that hospitals that are being paid a State's rural wage index are eventually included, when applicable, in that rural wage index calculation. We note that this form of manipulation (hospitals canceling rural status to remove their wage data from the rural wage index calculation) resulted in the rural wage index for one state increasing by over 4 percent between the FY 2020 proposed rule and the FY 2020 final rule. Based on our analysis, that figure could have been significantly greater (as high as 10 percent) in certain States. We further believe these proposed policies provide adequate time for hospitals to review their reclassification status and make appropriate decisions for future fiscal years. Hospitals that meet the proposed one-year minimum requirement in proposed § 412.103(g)(4) would have opportunity between the publication date of the final rule (and potential correction notices) and the end of the calendar year to evaluate whether to cancel or maintain their rural status for the next fiscal year.

3. Modification of Limitations on Redesignation by the Medicare Geographic Classification Review Board Interim Final Rule (CMS–1762–IFC) to implement *Bates Co.* v. *Azar* Adverse Court Decision

In the interim final rule with comment period (IFC) (CMS–1762–IFC) simultaneously submitted for public inspection with this proposed rule and publishing elsewhere in this issue of the **Federal Register**, CMS made regulatory changes in order to align our policy with the decision in *Bates County Memorial Hospital* v. *Azar,* 464 F. Supp. 3d 43 (D.D.C. 2020). Specifically, the IFC revised the regulations at § 412.230 to allow hospitals with a rural redesignation under Section 1886(d)(8)(E) to reclassify under the MGCRB using the rural reclassified area as the geographic area in which the hospital is located effective with reclassifications beginning with fiscal year (FY) 2023. We would also apply the policy in the IFC when deciding timely appeals before the Administrator of applications for reclassifications beginning with FY 2022 that were denied by the MGCRB due to the policy in effect prior to the IFC, which did not permit hospitals with rural redesignations to use the rural area's wage data for purposes of reclassifying under the MGCRB.

L. Process for Requests for Wage Index Data Corrections

1. Process for Hospitals To Request Wage Index Data Corrections

The preliminary, unaudited Worksheet S–3 wage data files for the proposed FY 2022 wage index were made available on May 18, 2020 and the preliminary CY 2019 occupational mix data files for the proposed FY 2022 wage index were made available on September 8, 2020 through the internet on the CMS website at: *https://www.cms.gov/medicaremedicare-fee-service-paymentacuteinpatientppswage-index-files/fy-2022-wage-index-home-page*.

On January 29, 2021, we posted a public use file (PUF) at: *https://www.cms.gov/medicaremedicare-fee-service-paymentacuteinpatientppswage-index-files/fy-2022-wage-index-home-page* containing FY 2022 wage index data available as of January 28, 2021. This PUF contains a tab with the Worksheet S–3 wage data (which includes Worksheet S–3, Parts II and III wage data from cost reporting periods beginning on or after October 1, 2017 through September 30, 2018; that is, FY 2018 wage data), a tab with the occupational mix data (which includes data from the CY 2019 occupational mix survey, Form CMS–10079), a tab containing the Worksheet S–3 wage data of hospitals deleted from the January 29, 2021 wage data PUF, and a tab containing the CY 2019 occupational mix data of the hospitals deleted from the January 29, 2021 occupational mix PUF. In a memorandum dated January 22, 2021, we instructed all MACs to inform the IPPS hospitals that they service of the availability of the January 29, 2021 wage index data PUFs, and the process and timeframe for requesting revisions in accordance with the FY 2022 Wage Index Timetable.

In the interest of meeting the data needs of the public, beginning with the proposed FY 2009 wage index, we post an additional PUF on the CMS website that reflects the actual data that are used in computing the proposed wage index. The release of this file does not alter the current wage index process or schedule. We notify the hospital community of the availability of these data as we do with the current public use wage data files through our Hospital Open Door Forum. We encourage hospitals to sign up for automatic notifications of information about hospital issues and about the dates of the Hospital Open Door Forums at the CMS website at: *https://www.cms.gov/Outreach-and-Education/Outreach/OpenDoorForums*.

In a memorandum dated April 14, 2020, we instructed all MACs to inform the IPPS hospitals that they service of the availability of the preliminary wage index data files posted on May 18, 2020, the requirement to submit the new CY 2019 occupational mix surveys by August 3, 2020 and the process and timeframe for requesting revisions. Subsequently, in a memorandum dated July 31, 2020, we revised the date hospitals were required to submit the new CY 2019 occupational mix surveys from August 3, 2020 to September 3, 2020, the date the preliminary CY 2019 occupational mix survey data files were scheduled to be posted from August 6, 2020 to September 8, 2020 and the timeframe for requesting revisions to the new CY 2019 occupational mix survey data.

If a hospital wished to request a change to its data as shown in the May 18, 2020 preliminary wage data files (or September 8, 2020 preliminary CY 2019 occupational mix survey data files), the hospital had to submit corrections along with complete, detailed supporting documentation to its MAC so that the MAC received them by September 3, 2020 (or by September 10, 2020 for preliminary CY 2019 occupational mix survey data files). Hospitals were notified of these deadlines and of all other deadlines and requirements, including the requirement to review and verify their data as posted in the preliminary wage index data files on the internet, through the letters sent to them by their MACs. November 16, 2020 was the deadline for MACs to complete all desk reviews for hospital wage and occupational mix data and transmit revised Worksheet S–3 wage data and occupational mix data to CMS.

November 5, 2020 was the date by when MACs notified State hospital

associations regarding hospitals that failed to respond to issues raised during the desk reviews. Additional revisions made by the MACs were transmitted to CMS throughout January 2021. CMS published the wage index PUFs that included hospitals' revised wage index data on January 29, 2021. Hospitals had until February 16, 2021, to submit requests to the MACs to correct errors in the January 29, 2021 PUF due to CMS or MAC mishandling of the wage index data, or to revise desk review adjustments to their wage index data as included in the January 29, 2021 PUF. Hospitals also were required to submit sufficient documentation to support their requests. Hospitals' requests and supporting documentation must be received by the MAC by the February deadline (that is, by February 16, 2021 for the FY 2021 wage index).

After reviewing requested changes submitted by hospitals, MACs were required to transmit to CMS any additional revisions resulting from the hospitals' reconsideration requests by March 19, 2021. Under our current policy as adopted in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38153), the deadline for a hospital to request CMS intervention in cases where a hospital disagreed with a MAC's handling of wage data on any basis (including a policy, factual, or other dispute) was April 2, 2021. Data that were incorrect in the preliminary or January 29, 2021 wage index data PUFs, but for which no correction request was received by the February 16, 2021 deadline, are not considered for correction at this stage. In addition, April 2, 2021 was the deadline for hospitals to dispute data corrections made by CMS of which the hospital was notified after the January 29, 2021 PUF and at least 14 calendar days prior to April 2, 2021 (that is, March 19, 2021), that do not arise from a hospital's request for revisions. The hospital's request and supporting documentation must be received by CMS (and a copy received by the MAC) by the April deadline (that is, by April 2, 2021 for the FY 2022 wage index). We refer readers to the wage index timeline for complete details.

Hospitals are given the opportunity to examine Table 2 associated with this proposed rule, which is listed in section VI. of the Addendum to the proposed rule and available via the internet on the CMS website at: *https://www.cms.gov/medicare/acute-inpatient-pps/fy-2022-ipps-proposed-rule-home-page*. Table 2 associated with the proposed rule contains each hospital's proposed adjusted average hourly wage used to construct the wage index values for the past 3 years, including the proposed FY 2022 wage index which was constructed from FY 2018 data.. We note that the proposed hospital average hourly wages shown in Table 2 only reflected changes made to a hospital's data that were transmitted to CMS by early February 2021.

We plan to post the final wage index data PUFs in late April 2021 on the CMS website at: *https://www.cms.gov/medicaremedicare-fee-service-paymentacuteinpatientppswage-index-files/fy-2022-wage-index-home-page*. The April 2021 PUFs are made available solely for the limited purpose of identifying any potential errors made by CMS or the MAC in the entry of the final wage index data that resulted from the correction process previously described (the process for disputing revisions submitted to CMS by the MACs by March 19, 2021, and the process for disputing data corrections made by CMS that did not arise from a hospital's request for wage data revisions as discussed earlier).

After the release of the April 2021 wage index data PUFs, changes to the wage and occupational mix data can only be made in those very limited situations involving an error by the MAC or CMS that the hospital could not have known about before its review of the final wage index data files. Specifically, neither the MAC nor CMS will approve the following types of requests:

- Requests for wage index data corrections that were submitted too late to be included in the data transmitted to CMS by the MACs on or before March 19, 2021.
- Requests for correction of errors that were not, but could have been, identified during the hospital's review of the January 29, 2021 wage index PUFs.
- Requests to revisit factual determinations or policy interpretations made by the MAC or CMS during the wage index data correction process.

If, after reviewing the April 2021 final wage index data PUFs, a hospital believes that its wage or occupational mix data are incorrect due to a MAC or CMS error in the entry or tabulation of the final data, the hospital is given the opportunity to notify both its MAC and CMS regarding why the hospital believes an error exists and provide all supporting information, including relevant dates (for example, when it first became aware of the error). The hospital is required to send its request to CMS and to the MAC so that it is received no later than May 28, 2021. May 28, 2021 is also the deadline for hospitals to dispute data corrections made by CMS of which the hospital is notified on or after 13 calendar days prior to April 2, 2021 (that is, March 20, 2021), and at least 14 calendar days prior to May 28, 2021 (that is, May 14, 2021), that do not arise from a hospital's request for revisions. (Data corrections made by CMS of which a hospital was notified on or after 13 calendar days prior to May 28, 2021 (that is, May 15, 2021) may be appealed to the Provider Reimbursement Review Board (PRRB)). In accordance with the FY 2022 wage index timeline posted on the CMS website at: *https://www.cms.gov/files/document/fy-2022-hospital-wage-index-development-time-table.pdf*, the May appeals are required to be sent via mail and email to CMS and the MACs. We refer readers to the wage index timeline for complete details.

Verified corrections to the wage index data received timely (that is, by May 28, 2021) by CMS and the MACs will be incorporated into the final FY 2022 wage index, which will be effective October 1, 2021.

We created the processes previously described to resolve all substantive wage index data correction disputes before we finalize the wage and occupational mix data for the FY 2022 payment rates. Accordingly, hospitals that do not meet the procedural deadlines set forth earlier will not be afforded a later opportunity to submit wage index data corrections or to dispute the MAC's decision with respect to requested changes. Specifically, our policy is that hospitals that do not meet the procedural deadlines as previously set forth (requiring requests to MACs by the specified date in February and, where such requests are unsuccessful, requests for intervention by CMS by the specified date in April) will not be permitted to challenge later, before the PRRB, the failure of CMS to make a requested data revision. We refer readers also to the FY 2000 IPPS final rule (64 FR 41513) for a discussion of the parameters for appeals to the PRRB for wage index data corrections. As finalized in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38154 through 38156), this policy also applies to a hospital disputing corrections made by CMS that do not arise from a hospital's request for a wage index data revision. That is, a hospital disputing an adjustment made by CMS that did not arise from a hospital's request for a wage index data revision is required to request a correction by the first applicable deadline. Hospitals that do not meet the procedural deadlines set forth earlier will not be afforded a later opportunity to submit wage index data corrections or to dispute CMS' decision with respect to changes.

Again, we believe the wage index data correction process described earlier provides hospitals with sufficient opportunity to bring errors in their wage and occupational mix data to the MAC's attention. Moreover, because hospitals had access to the final wage index data PUFs by late April 2021, they have an opportunity to detect any data entry or tabulation errors made by the MAC or CMS before the development and publication of the final FY 2022 wage index by August 2021, and the implementation of the FY 2022 wage index on October 1, 2021. Given these processes, the wage index implemented on October 1 should be accurate. Nevertheless, in the event that errors are identified by hospitals and brought to our attention after May 28, 2021, we retain the right to make midyear changes to the wage index under very limited circumstances.

Specifically, in accordance with 42 CFR 412.64(k)(1) of our regulations, we make midyear corrections to the wage index for an area only if a hospital can show that: (1) The MAC or CMS made an error in tabulating its data; and (2) the requesting hospital could not have known about the error or did not have an opportunity to correct the error, before the beginning of the fiscal year. For purposes of this provision, ''before the beginning of the fiscal year'' means by the May deadline for making corrections to the wage data for the following fiscal year's wage index (for example, May 28, 2021 for the FY 2022 wage index). This provision is not available to a hospital seeking to revise another hospital's data that may be affecting the requesting hospital's wage index for the labor market area. As indicated earlier, because CMS makes the wage index data available to hospitals on the CMS website prior to publishing both the proposed and final IPPS rules, and the MACs notify hospitals directly of any wage index data changes after completing their desk reviews, we do not expect that midyear corrections will be necessary. However, under our current policy, if the correction of a data error changes the wage index value for an area, the revised wage index value will be effective prospectively from the date the correction is made.

In the FY 2006 IPPS final rule (70 FR 47385 through 47387 and 47485), we revised 42 CFR 412.64(k)(2) to specify that, effective on October 1, 2005, that is, beginning with the FY 2006 wage index, a change to the wage index can be made retroactive to the beginning of the Federal fiscal year only when CMS determines all of the following: (1) The MAC or CMS made an error in tabulating data used for the wage index calculation; (2) the hospital knew about the error and requested that the MAC and CMS correct the error using the established process and within the established schedule for requesting corrections to the wage index data, before the beginning of the fiscal year for the applicable IPPS update (that is, by the May 28, 2021 deadline for the FY 2022 wage index); and (3) CMS agreed before October 1 that the MAC or CMS made an error in tabulating the hospital's wage index data and the wage index should be corrected.

In those circumstances where a hospital requested a correction to its wage index data before CMS calculated the final wage index (that is, by the May 28, 2021 deadline for the FY 2022 wage index), and CMS acknowledges that the error in the hospital's wage index data was caused by CMS' or the MAC's mishandling of the data, we believe that the hospital should not be penalized by our delay in publishing or implementing the correction. As with our current policy, we indicated that the provision is not available to a hospital seeking to revise another hospital's data. In addition, the provision cannot be used to correct prior years' wage index data; it can only be used for the current Federal fiscal year. In situations where our policies would allow midyear corrections other than those specified in 42 CFR 412.64(k)(2)(ii), we continue to believe that it is appropriate to make prospective-only corrections to the wage index.

We note that, as with prospective changes to the wage index, the final retroactive correction will be made irrespective of whether the change increases or decreases a hospital's payment rate. In addition, we note that the policy of retroactive adjustment will still apply in those instances where a final judicial decision reverses a CMS denial of a hospital's wage index data revision request.

2. Process for Data Corrections by CMS After the January 29 Public Use File (PUF)

The process set forth with the wage index timeline discussed in section III.L.1. of the preamble of this proposed rule allows hospitals to request corrections to their wage index data within prescribed timeframes. In addition to hospitals' opportunity to request corrections of wage index data errors or MACs' mishandling of data, CMS has the authority under section 1886(d)(3)(E) of the Act to make corrections to hospital wage index and occupational mix data in order to ensure the accuracy of the wage index. As we explained in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49490 through 49491) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 56914), section 1886(d)(3)(E) of the Act requires the Secretary to adjust the proportion of hospitals' costs attributable to wages and wage-related costs for area differences reflecting the relative hospital wage level in the geographic areas of the hospital compared to the national average hospital wage level. We believe that, under section 1886(d)(3)(E) of the Act, we have discretion to make corrections to hospitals' data to help ensure that the costs attributable to wages and wage-related costs in fact accurately reflect the relative hospital wage level in the hospitals' geographic areas.

We have an established multistep, 15-month process for the review and correction of the hospital wage data that is used to create the IPPS wage index for the upcoming fiscal year. Since the origin of the IPPS, the wage index has been subject to its own annual review process, first by the MACs, and then by CMS. As a standard practice, after each annual desk review, CMS reviews the results of the MACs' desk reviews and focuses on items flagged during the desk review, requiring that, if necessary, hospitals provide additional documentation, adjustments, or corrections to the data. This ongoing communication with hospitals about their wage data may result in the discovery by CMS of additional items that were reported incorrectly or other data errors, even after the posting of the January 29 PUF, and throughout the remainder of the wage index development process. In addition, the fact that CMS analyzes the data from a regional and even national level, unlike the review performed by the MACs that review a limited subset of hospitals, can facilitate additional editing of the data that may not be readily apparent to the MACs. In these occasional instances, an error may be of sufficient magnitude that the wage index of an entire CBSA is affected. Accordingly, CMS uses its authority to ensure that the wage index accurately reflects the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level, by continuing to make corrections to hospital wage data upon discovering incorrect wage data, distinct from instances in which hospitals request data revisions.

We note that CMS corrects errors to hospital wage data as appropriate, regardless of whether that correction will raise or lower a hospital's average hourly wage. For example, as discussed

in section III.C. of the preamble of the FY 2019 IPPS/LTCH PPS final rule (83 FR 41364), in situations where a hospital did not have documentable salaries, wages, and hours for housekeeping and dietary services, we imputed estimates, in accordance with policies established in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49965 through 49967). Furthermore, if CMS discovers after conclusion of the desk review, for example, that a MAC inadvertently failed to incorporate positive adjustments resulting from a prior year's wage index appeal of a hospital's wage-related costs such as pension, CMS would correct that data error and the hospital's average hourly wage would likely increase as a result.

While we maintain CMS' authority to conduct additional review and make resulting corrections at any time during the wage index development process, in accordance with the policy finalized in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38154 through 38156) and as first implemented with the FY 2019 wage index (83 FR 41389), hospitals are able to request further review of a correction made by CMS that did not arise from a hospital's request for a wage index data correction. Instances where CMS makes a correction to a hospital's data after the January 29 PUF based on a different understanding than the hospital about certain reported costs, for example, could potentially be resolved using this process before the final wage index is calculated. We believe this process and the timeline for requesting review of such corrections (as described earlier and in the FY 2018 IPPS/LTCH PPS final rule) promote additional transparency to instances where CMS makes data corrections after the January 29 PUF, and provide opportunities for hospitals to request further review of CMS changes in time for the most accurate data to be reflected in the final wage index calculations. These additional appeals opportunities are described earlier and in the FY 2022 Wage Index Development Time Table, as well as in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38154 through 38156).

M. Proposed Labor-Related Share for the FY 2022 Wage Index

Section 1886(d)(3)(E) of the Act directs the Secretary to adjust the proportion of the national prospective payment system base payment rates that are attributable to wages and wage-related costs by a factor that reflects the relative differences in labor costs among geographic areas. It also directs the Secretary to estimate from time to time the proportion of hospital costs that are labor-related and to adjust the proportion (as estimated by the Secretary from time to time) of hospitals' costs that are attributable to wages and wage-related costs of the DRG prospective payment rates. We refer to the portion of hospital costs attributable to wages and wage-related costs as the labor-related share. The labor-related share of the prospective payment rate is adjusted by an index of relative labor costs, which is referred to as the wage index.

Section 403 of Public Law 108–173 amended section 1886(d)(3)(E) of the Act to provide that the Secretary must employ 62 percent as the labor-related share unless this would result in lower payments to a hospital than would otherwise be made. However, this provision of Public Law 108–173 did not change the legal requirement that the Secretary estimate from time to time the proportion of hospitals' costs that are attributable to wages and wage-related costs. Thus, hospitals receive payment based on either a 62-percent labor-related share, or the labor-related share estimated from time to time by the Secretary, depending on which labor-related share resulted in a higher payment.

In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38158 through 38175), we rebased and revised the hospital market basket. We established a 2014-based IPPS hospital market basket to replace the FY 2010-based IPPS hospital market basket, effective October 1, 2017. Using the 2014-based IPPS market basket, we finalized a labor-related share of 68.3 percent for discharges occurring on or after October 1, 2017. In addition, in FY 2018, we implemented this revised and rebased labor-related share in a budget neutral manner (82 FR 38522). However, consistent with section 1886(d)(3)(E) of the Act, we did not take into account the additional payments that would be made as a result of hospitals with a wage index less than or equal to 1.0000 being paid using a labor-related share lower than the labor-related share of hospitals with a wage index greater than 1.0000. In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58793), for FY 2021, we continued to use a labor-related share of 68.3 percent for discharges occurring on or after October 1, 2020.

As described in section IV. of the preamble of this proposed rule, effective beginning FY 2022, we are proposing to rebase and revise the IPPS market basket to reflect a 2018 base year. We also are proposing to recalculate the labor-related share for discharges occurring on or after October 1, 2021 using the proposed 2018-based IPPS market basket. As discussed in Appendix A of this proposed rule, we are proposing this rebased and revised labor -related share in a budget neutral manner. However, consistent with section 1886(d)(3)(E) of the Act, we would not take into account the additional payments that would be made as a result of hospitals with a wage index less than or equal to 1.0000 being paid using a labor-related share lower than the labor-related share of hospitals with a wage index greater than 1.0000.

The labor-related share is used to determine the proportion of the national IPPS base payment rate to which the area wage index is applied. We include a cost category in the labor-related share if the costs are labor intensive and vary with the local labor market. As described in section IV. of the preamble of this proposed rule, beginning with FY 2022, we are proposing to include in the labor-related share the national average proportion of operating costs that are attributable to the following cost categories in the proposed 2018-based IPPS market basket: Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; and All Other Labor-Related Services, as measured in the proposed 2018-based IPPS market basket. Therefore, for FY 2022, we are proposing to use a labor-related share of 67.6 percent for discharges occurring on or after October 1, 2021.

As discussed in section V.B. of the preamble of this proposed rule, prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, we applied the Puerto Rico-specific labor-related share percentage and nonlabor-related share percentage to the Puerto Rico-specific standardized amount. Section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount as of January 1, 2016, under section 1886(d)(9)(E) of the Act as amended by section 601 of the Consolidated Appropriations Act, 2016, there is no longer a need for us to calculate a Puerto Rico-specific labor-related share percentage and nonlabor-related share percentage for application

to the Puerto Rico-specific standardized amount. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the national labor-related share and nonlabor-related share percentages that are applied to the national standardized amount. Accordingly, for FY 2022, we are not proposing a Puerto Rico-specific labor-related share percentage or a nonlabor-related share percentage.

Tables 1A and 1B, which are published in section VI. of the Addendum to this FY 2022 IPPS/LTCH PPS proposed rule and available via the internet on the CMS website, reflect the proposed national labor-related share, which is also applicable to Puerto Rico hospitals. For FY 2022, for all IPPS hospitals (including Puerto Rico hospitals) whose wage indexes are less than or equal to 1.0000, we are proposing to apply the wage index to a labor-related share of 62 percent of the national standardized amount. For all IPPS hospitals (including Puerto Rico hospitals) whose wage indexes are greater than 1.000, for FY 2022, we are proposing to apply the wage index to the proposed labor-related share of 67.6 percent of the national standardized amount.

IV. Proposed Rebasing and Revising of the Hospital Market Baskets for Acute Care Hospitals

A. Background

Effective for cost reporting periods beginning on or after July 1, 1979, we developed and adopted a hospital input price index (that is, the hospital market basket for operating costs). Although ''market basket'' technically describes the mix of goods and services used in providing hospital care, this term is also commonly used to denote the input price index (that is, cost category weights and price proxies combined) derived from that market basket. Accordingly, the term ''market basket'' as used in this document refers to the hospital input price index.

The percentage change in the market basket reflects the average change in the price of goods and services hospitals purchase in order to provide inpatient care. We first used the market basket to adjust hospital cost limits by an amount that reflected the average increase in the prices of the goods and services used to provide hospital inpatient care. This approach linked the increase in the cost limits to the efficient utilization of resources.

Since the inception of the IPPS, the projected change in the hospital market basket has been the integral component of the update factor by which the prospective payment rates are updated every year. An explanation of the hospital market basket used to develop the prospective payment rates was published in the **Federal Register** on September 1, 1983 (48 FR 39764). We also refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38158 through 38175) in which we discussed the most recent previous rebasing of the hospital input price index.

The hospital market basket is a fixed-weight, Laspeyres-type price index. A Laspeyres-type price index measures the change in price, over time, of the same mix of goods and services purchased in the base period. Any changes in the quantity or mix of goods and services (that is, intensity) purchased over time are not measured.

The index itself is constructed in three steps. First, a base period is selected (in this proposed rule, we are proposing to use 2018 as the base period) and total base period expenditures are estimated for a set of mutually exclusive and exhaustive spending categories, and the proportion of total costs that each category represents are calculated. These proportions are called ''cost weights'' or ''expenditure weights.'' Second, each expenditure category is matched to an appropriate price or wage variable, referred to as a ''price proxy.'' In almost every instance, these price proxies are derived from publicly available statistical series that are published on a consistent schedule (preferably at least on a quarterly basis). Finally, the expenditure weight for each cost category is multiplied by the level of its respective price proxy. The sum of these products (that is, the expenditure weights multiplied by their price index levels) for all cost categories yields the composite index level of the market basket in a given period. Repeating this step for other periods produces a series of market basket levels over time. Dividing an index level for a given period by an index level for an earlier period produces a rate of growth in the input price index over that timeframe.

As previously noted, the market basket is described as a fixed-weight index because it represents the change in price over time of a constant mix (quantity and intensity) of goods and services needed to provide hospital services. The effects on total expenditures resulting from changes in the mix of goods and services purchased subsequent to the base period are not measured. For example, a hospital hiring more nurses to accommodate the needs of patients would increase the volume of goods and services purchased by the hospital, but would not be factored into the price change measured by a fixed-weight hospital market basket. Only when the index is rebased would changes in the quantity and intensity be captured, with those changes being reflected in the cost weights. Therefore, we rebase the market basket periodically so that the cost weights reflect recent changes in the mix of goods and services that hospitals purchase (hospital inputs) to furnish inpatient care between base periods.

We last rebased the hospital market basket cost weights effective for FY 2018 (82 FR 38158 through 38175), with 2014 data used as the base period for the construction of the market basket cost weights. For this FY 2022 IPPS/LTCH PPS proposed rule, we are proposing to rebase the IPPS operating market basket to reflect the 2018 cost structure for IPPS hospitals and to revise applicable cost categories and price proxies used to determine the IPPS market basket, as discussed in this rule. We are also proposing to rebase and revise the Capital Input Price Index (CIPI) as described in section IV.D. of the preamble of this proposed rule.

B. Rebasing and Revising the IPPS Market Basket

The terms ''rebasing'' and ''revising,'' while often used interchangeably, actually denote different activities. ''Rebasing'' means moving the base year for the structure of costs of an input price index (for example, in this proposed rule, we are proposing to shift the base year cost structure for the IPPS hospital index from 2014 to 2018). ''Revising'' means changing data sources or price proxies used in the input price index. As published in the FY 2006 IPPS final rule (70 FR 47387), in accordance with section 404 of Public Law 108–173, CMS determined a new frequency for rebasing the hospital market basket. We established a rebasing frequency of every 4 years and, therefore, for the FY 2022 IPPS update, we are proposing to rebase and revise the IPPS market basket from 2014 to 2018. We are inviting public comments on our proposed methodology.

1. Development of Cost Categories and Weights

a. Use of Medicare Cost Report Data

The major source of expenditure data for developing the proposed rebased and revised hospital market basket cost weights is the 2018 Medicare cost reports. These 2018 Medicare cost reports are for cost reporting periods beginning on and after October 1, 2017

and before October 1, 2018. We are proposing to use 2018 as the base year because we believe that the 2018 Medicare cost reports represent the most recent, complete set of Medicare cost report data available to develop cost weights for IPPS hospitals at the time of rulemaking. We believe it is important to regularly rebase and revise the IPPS market basket to reflect more recent data. Historically, the cost weights change minimally from year to year as they represent percent of total operating costs rather than cost levels; however, given the COVID–19 public health emergency we will continue to monitor the upcoming Medicare cost report data to see if a more frequent rebasing schedule is necessary than our current schedule of every 4 years. As was done in previous rebasings, these cost reports are from IPPS hospitals only (hospitals excluded from the IPPS and CAHs are not included) and are based on IPPS Medicare-allowable operating costs. IPPS Medicare-allowable operating costs are costs that are eligible to be paid under the IPPS. For example, the IPPS market basket excludes home health agency (HHA) costs as these costs would be paid under the HHA PPS and, therefore, these costs are not IPPS Medicare-allowable costs.

The current set of instructions for the Medicare cost reports for hospitals (Form 2552–10, OMB Control Number 0938–0050) can be found in Chapter 40 at the following website (*https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Paper-Based-Manuals-Items/CMS021935*, accessed February 17, 2021). As described in these instructions, effective for cost reporting periods beginning on or after October 1, 2015, Worksheet S–3, Part II was revised to add lines 14.01, 14.02, 25.50, 25.51, 25.52, and 25.53, to enhance the wage index data collection. This modification was made for Transmittal 10 and is specifically highlighted in the instructions, which can be found at the following website: (*https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/Downloads/R10P240.pdf*, accessed February 17, 2021). Therefore, as noted later in this section, for the 2018-based IPPS market basket, we are proposing to use these more detailed lines for the development of the market basket cost categories. These detailed lines were not available at the time we finalized the 2014-based IPPS market basket.

We are proposing to derive costs for eight major expenditures or cost categories for the 2018-based IPPS market basket from the CMS Medicare cost reports (Form 2552–10, OMB Control Number 0938–0050): Wages and Salaries, Employee Benefits, Contract Labor, Pharmaceuticals, Professional Liability Insurance (Malpractice), Blood and Blood Products, Home Office/Related Organization Contract Labor, and a residual ''All Other'' category. The residual ''All Other'' category reflects all remaining costs that are not captured in the other seven cost categories. These are the same major cost categories from the Medicare cost reports that were derived for the 2014-based IPPS market basket. In this rule, we describe the detailed methodology for obtaining costs for each of the seven cost categories directly determined from the Medicare cost reports.

In order to create a market basket that is representative of IPPS hospitals serving Medicare patients and to help ensure accurate major cost weights (which is the percent of total Medicare-allowable operating costs, as defined in this rule), we propose to apply edits to remove reporting errors and outliers. Specifically, the IPPS Medicare cost reports used to calculate the market basket cost weights exclude any providers that reported costs less than or equal to zero for the following categories: Total Medicare inpatient costs (Worksheet D, Part I, column 1, line 49); Medicare PPS payments (Worksheet E, Part A, column 1, line 59); Total salary costs (Worksheet S–3, Part II, column 2, line 1). We also limited our sample to providers that had a Medicare cost reporting period that was between 10 and 14 months. The final sample used included roughly 3,200 Medicare cost reports (about 94 percent of the universe of IPPS Medicare cost reports for 2018). The sample of providers is representative of the national universe of providers by ownership-type (proprietary, nonprofit, and government) and by urban/rural status.

First, we are proposing to calculate total Medicare-allowable operating costs for each hospital. We are proposing that total Medicare-allowable operating costs are equal to noncapital costs (Worksheet B, Part I, column 26 less Worksheet B, Part II, column 26) that are attributable to the Medicare-allowable cost centers of the hospital. We are proposing that Medicare-allowable cost centers are lines 30 through 35, 50 through 60, 62 through 76, 90, 91, 92.01, 93, 96 and 97. This is the same general methodology that was used for the 2014-based IPPS market basket. However, we note that for the development of the 2018-based IPPS market basket, we conducted a detailed review of the cost centers and are now proposing to include lines 52, 96, and 97 when deriving total Medicare-allowable operating costs as these reflect Medicare-allowable services that are reimbursed under the IPPS.

(1) Wages and Salaries Costs

To derive wages and salaries costs for the Medicare-allowable cost centers, we are proposing to first calculate total unadjusted wages and salaries costs as reported on Worksheet S–3, Part II, column 4, line 1. We are then proposing to remove the wages and salaries attributable to non-Medicare-allowable cost centers (that is, excluded areas) as well as a portion of overhead wages and salaries attributable to these excluded areas. This is the same general methodology that was used to derive wages and salaries costs for the 2014-based IPPS market basket. However, we note that we are proposing minor changes to the Medicare cost report lines that are used to derive excluded area wages and salaries as well as overhead wages and salaries attributable to these areas as described in this rule as we believe these represent a technical improvement to the Medicare cost report lines used for the 2014-based IPPS market basket. The description of the detailed methodology used for the 2014-based IPPS market basket was provided in the FY 2018 IPPS/LTCH final rule (82 FR 38159).

Specifically, we are proposing to calculate excluded area wages and salaries as equal to the sum of Worksheet S–3, Part II, column 4, lines 3, 4.01, 5, 6, 7, 7.01, 8, 9, and 10 less Worksheet A, column 1, lines 20 and 23. Overhead wages and salaries are attributable to the entire IPPS facility. Therefore, we are proposing to only include the proportion attributable to the Medicare-allowable cost centers. Specifically, we are proposing to estimate the proportion of overhead wages and salaries that are not attributable to Medicare-allowable costs centers (that is, excluded areas) by first calculating the ratio of total Medicare-allowable operating costs as previously defined to total facility operating costs (Worksheet B, Part I, column 26, line 202 less Worksheet B, Part I, column 0, lines 1 and 2). We then are proposing to multiply this ratio by total overhead wages and salaries (Worksheet S–3, Part II, column 4, lines 26, 27, 29 through 32, 34, and 36 through 43).

Therefore, the proposed wages and salaries costs are equal to total wages and salaries costs less: (a) Excluded area wages and salaries costs and b) overhead wages and salaries costs attributable to the excluded areas.

(2) Employee Benefits Costs

We are proposing to derive employee benefits costs using a similar methodology as the wages and salaries costs; that is, reflecting employee benefits costs attributable to the Medicare-allowable cost centers. First, we calculate total unadjusted employee benefits costs as the sum of Worksheet S–3, Part II, column 4, lines 17, 18, 20, 22, and 25.52. The 2014-based IPPS market basket used Worksheet S–3, Part II, column 4, lines 17, 18, 20 and 22 to derive the costs for this category. As described previously, line 25.52 reflects a newly added line to Worksheet S–3, Part II since the development of the 2014-based IPPS market basket.

We then exclude those employee benefits attributable to the overhead wages and salaries for the non-Medicare-allowable cost centers (that is, the excluded areas). Employee benefits attributable to the non-Medicare-allowable cost centers are derived by multiplying the ratio of total employee benefits (equal to the sum of Worksheet S–3, Part II, column 4, lines 17, 18, 19, 20, 21, 22, 22.01, 23, 24, 25, 25.50, 25.51, 25.52, and 25.53) to total wages and salaries (Worksheet S–3, Part II, column 4, line 1) by excluded overhead wages and salaries (as previously described in section IV.B.1.a.(1). of the preamble of this proposed rule for wages and salaries costs). A similar methodology was used in the 2014-based IPPS market basket.

(3) Contract Labor Costs

Contract labor costs are primarily associated with direct patient care services. Contract labor costs for services such as accounting, billing, and legal are estimated using other government data sources as described in this rule. We are proposing to derive contract labor costs for the 2018-based IPPS market basket as the sum of Worksheet S–3, Part II, column 4, lines 11, 13, and 15. A similar methodology was used in the 2014-based IPPS market basket.

(4) Professional Liability Insurance Costs

We are proposing that professional liability insurance (PLI) costs (often referred to as malpractice costs) be equal to premiums, paid losses, and self-insurance costs reported on Worksheet S–2, Part I, columns 1 through 3, line 118.01. A similar methodology was used for the 2014-based IPPS market basket.

(5) Pharmaceuticals Costs

We are proposing to calculate pharmaceuticals costs as total costs reported for the Pharmacy cost center (Worksheet B, Part I, column 0, line 15) and Drugs Charged to Patients cost center (Worksheet B, Part I, column 0, line 73) less wages and salaries attributable to these two cost centers (Worksheet S–3, Part II, column 4, line 40 and Worksheet A, column 1, line 73) less estimated employee benefits attributable to these two cost centers. We are proposing to estimate the employee benefits costs by multiplying the ratio of total employee benefits (equal to the sum of Worksheet S–3, Part II, column 4, lines 17, 18, 19, 20, 21, 22, 22.01, 23, 24, 25, 25.50, 25.51, 25.52, and 25.53) to total wages and salaries (Worksheet S–3, Part II, column 4, line 1) by total wages and salaries costs for the Pharmacy and Drugs Charged to Patients cost centers (equal to the sum of Worksheet S–3, Part II, column 4, line 40 and Worksheet A, column 1, line 73). The same general methodology was used for the 2014-based IPPS market basket. However, we note that for the 2014-based IPPS market basket, for calculating the total nonsalary costs we used Worksheet A, column 2 for each cost center instead of our proposed method of using Worksheet B, Part I, column 0, less salary costs. We are proposing to use Worksheet B, Part I, column 0 as this would reflect reclassifications and adjustments (which are made on columns subsequent to Worksheet A columns 1 and 2).

(6) Blood and Blood Products Costs

We are proposing to calculate blood and blood products costs as total costs reported for the Whole Blood & Packed Red Blood Cells cost center (Worksheet B, Part I, column 0, line 62) and the Blood Storing, Processing, & Transfusing cost center (Worksheet B, Part I, column 0, Line 63) less wages and salaries attributable to these two cost centers (Worksheet A, column 1, lines 62 and 63) less estimated employee benefits attributable to these two cost centers. We estimate these employee benefits costs by multiplying the ratio of total employee benefits (equal to the sum of Worksheet S–3, Part II, column 4, lines 17, 18, 19, 20, 21, 22, 22.01, 23, 24, 25, 25.50, 25.51, 25.52, and 25.53) to total wages and salaries (Worksheet S–3, Part II, column 4, line 1) by total wages and salaries for the Whole Blood & Packed Red Blood Cells and Blood Storing, Processing, & Transfusing cost centers (equal to the sum of Worksheet A, Column 1, lines 62 and 63). The same general methodology was used for the 2014-based IPPS market basket. However, we note that for the 2014-based IPPS market basket, for calculating the total nonsalary costs we used Worksheet A, column 2 for lines 62 and 63 instead of our proposed method of using Worksheet B, Part I, column 0, lines 62 and 63, less salary costs. Similar to our proposed method for Pharmaceuticals costs, we are proposing to use Worksheet B, Part I, column 0 as this would reflect reclassifications and adjustments (which are made on columns subsequent to Worksheet A columns 1 and 2).

(7) Home Office Contract Labor/Related Organization Costs

We are proposing to determine home office/related organization contract labor costs using data reported on Worksheet S–3, Part II, column 4, lines 14.01, 14.02, 25.50, and 25.51. Home office/related organization contract labor costs in the 2014-based IPPS market basket were calculated using a similar method except we used data reported on Worksheet S–3, Part II, column 4, line 14. As described previously, effective for cost reporting periods beginning on or after October 1, 2015 (Transmittal 10), Worksheet S–3, Part II was revised to add lines 14.01, 14.02, 25.50, 25.51, 25.52, and 25.53, to enhance the wage index data collection. Therefore, for the 2018-based IPPS market basket, we are proposing to use these more detailed lines; however, the expenses captured on these lines would be similar to the expenses originally reported on line 14, prior to the break out of the expenses on these new more detailed lines.

In addition, for the 2014-based IPPS market basket, we then multiplied the home office/related organization contract labor costs by the ratio of total Medicare-allowable operating costs to total operating costs. However, for the 2018-based IPPS market basket, we are no longer proposing to apply this adjustment since the Medicare cost report instructions effective for Transmittal 10 now state that the costs reported on these lines should reflect costs associated with Medicare-allowable cost centers. Therefore, we no longer believe this adjustment is necessary.

b. Final Major Cost Category Computation

After we derived costs for the seven major cost categories for each provider using the Medicare cost report data as previously described, we are proposing to address data outliers using the following steps. First, we divide the costs for each of the seven categories (calculated as previously described in this section) by total Medicare-allowable operating costs for the provider

(calculated as previously described in this section) to obtain cost weights for each PPS hospital.

For each of the major cost weights except the Home Office/Related Organization Contract Labor cost weight, we are proposing to trim the data to remove outliers (a standard statistical process) by: (1) Requiring that major expenses (such as Wages and Salaries costs) and total Medicare-allowable operating costs be greater than zero; and (2) excluding the top and bottom five percent of the major cost weight (for example, Wages and Salaries costs as a percent of total Medicare-allowable operating costs). We note that missing values are assumed to be zero consistent with the methodology for how missing values were treated in the 2014-based IPPS market basket. After the outliers have been removed, we sum the costs for each category across all remaining providers. We then divide this by the sum of total Medicare-allowable operating costs across all remaining providers to obtain a cost weight for the proposed 2018-based IPPS market basket for the given category.

For the Home Office/Related Organization Contract Labor cost weight, we are proposing to apply a trim that excludes those reporters above the 99th percentile. This allows all providers' Medicare-allowable costs to be included, even if their home office/related organization contract labor costs were reported to be zero. The Medicare cost report data (Worksheet S–2, Part I, line 140) indicate that not all hospitals have a home office. IPPS hospitals without a home office would report administrative costs that might typically be associated with a home office in the Wages and Salaries and Employee Benefits cost weights, or in the residual ''All Other'' cost weight if they purchased these types of services from external contractors. We believe the trimming methodology that excludes those who report a Home Office/Related Organization Contract Labor cost weight above the 99th percentile is appropriate as it removes extreme outliers while also allowing providers with zero home office/related organization contract labor costs to be included in the Home Office/Related Organization Contract Labor cost weight calculation. Next, similar to the other cost weights, after the outliers have been removed, we sum the costs across all remaining providers. We then divide this by the sum of total Medicare-allowable operating costs across all remaining providers to obtain a cost weight for the proposed 2018-based IPPS market basket.

The trimming process is done individually for each cost category so that providers excluded from one cost weight calculation are not automatically excluded from another cost weight calculation. We note that these proposed trimming methods are the same types of edits performed for the 2014-based IPPS market basket, as well as other PPS market baskets (including but not limited to SNF market basket and HHA market basket). We believe this trimming process improves the accuracy of the data used to compute the major cost weights by removing possible misreported data. We note that for each of the cost weights we evaluated the distribution of providers and costs by ownership-type, and by urban/rural status. For all of the cost weights, the trimmed sample was nationally representative.

Finally, we calculate the residual ''All Other'' cost weight that reflects all remaining costs that are not captured in the seven cost categories listed. Table IV–01 shows the major cost categories and their respective cost weights as derived from the Medicare cost reports for this proposed rule.

TABLE IV-01.—MAJOR COST CATEGORIES AS DERIVED FROM THE MEDICARE COST REPORTS

Major Cost Categories	2014-based IPPS Market Basket	Proposed 2018-based IPPS Market Basket
Wages and Salaries	42.1	39.7
Employee Benefits	12.0	11.3
Contract Labor	1.8	2.0
Professional Liability Insurance (Malpractice)	1.2	1.0
Pharmaceuticals	5.9	7.1
Blood and Blood Products	0.8	0.6
Home Office/Related Organization Contract Labor	4.2	5.9
"All Other" Residual	32.0	32.4

From 2014 to 2018, the Wages and Salaries and Employee Benefits cost weights as calculated directly from the Medicare cost reports decreased by approximately 2.4 percentage points and 0.7 percentage point, respectively, while the Contract Labor cost weight increased slightly by 0.2 percentage point.

As we did for the 2014-based IPPS market basket (82 FR 38162), we are proposing to allocate contract labor costs to the Wages and Salaries and Employee Benefits cost weights based on their relative proportions for employed labor under the assumption that contract labor costs are comprised of both wages and salaries and employee benefits. The contract labor allocation proportion for wages and salaries is equal to the Wages and Salaries cost weight as a percent of the sum of the Wages and Salaries cost weight and the Employee Benefits cost weight. Using the 2018 Medicare cost report data, this percentage is 78 percent. Therefore, we are proposing to allocate approximately 78 percent of the Contract Labor cost weight to the Wages and Salaries cost weight and 22 percent to the Employee Benefits cost weight. The 2014-based IPPS market basket also allocated 78 percent of the Contract Labor cost weight to the Wages and Salaries cost weight.

Table IV–02 shows the Wages and Salaries and Employee Benefits cost weights after contract labor allocation for the 2014-based IPPS market basket and the proposed 2018-based IPPS market basket. In aggregate, the

Compensation cost weight (calculated using more detailed decimal places) decreased from 55.8 percent to 53.0 percent, or 2.8 percentage points.

TABLE IV-02.—WAGES AND SALARIES AND EMPLOYEE BENEFITS COST WEIGHTS AFTER CONTRACT LABOR ALLOCATION

Major Cost Categories	2014-Based IPPS Market Basket	Proposed 2018-Based IPPS Market Basket
Total Compensation	**55.8**	**53.0**
Wages and Salaries	43.4	41.2
Employee Benefits	12.4	11.7

*Totals may not sum due to rounding

c. Derivation of the Detailed Cost Weights

To further divide the ''All Other'' residual cost weight estimated from the 2018 Medicare cost report data into more detailed cost categories, we are proposing to use the 2012 Benchmark I–O ''Use Tables/Before Redefinitions/Purchaser Value'' for NAICS 622000, Hospitals, published by the BEA. These data are publicly available at the following website: *http://www.bea.gov/industry/io_annual.htm.* The BEA Benchmark I–O data are generally scheduled for publication every 5 years on a lagged basis, with the most recent data available for 2012. The 2012 Benchmark I–O data are derived from the 2012 Economic Census and are the building blocks for BEA's economic accounts. Therefore, they represent the most comprehensive and complete set of data on the economic processes or mechanisms by which output is produced and distributed.[934] BEA also produces Annual I–O estimates. However, while based on a similar methodology, these estimates reflect less comprehensive and less detailed data sources and are subject to revision when benchmark data become available. Instead of using the less detailed Annual I–O data, we are proposing to inflate the detailed 2012 Benchmark I–O data forward to 2018 by applying the annual price changes from the respective price proxies to the appropriate market basket cost categories that are obtained from the 2012 Benchmark I–O data. In our calculations for this proposed rule, we repeated this practice for each year. We then calculated the cost shares that each cost category represents of the 2012 data inflated to 2018. These resulting 2018 cost shares were applied to the ''All Other'' residual cost weight to obtain the detailed cost weights for the proposed 2018-based IPPS market basket. For example, the cost for Food: Direct Purchases represents 4.8 percent of the sum of the ''All Other'' 2012 Benchmark I–O Hospital Expenditures inflated to 2018. Therefore, the Food: Direct Purchases cost weight represents 4.8 percent of the proposed 2018-based IPPS market basket's ''All Other'' cost category (32.4 percent), yielding a Food: Direct Purchases proposed cost weight of 1.6 percent in the proposed 2018-based IPPS market basket (0.048 × 32.4 percent = 1.6 percent). For the 2014-based IPPS market basket (82 FR 38162), we used the same methodology utilizing the 2007 Benchmark I–O data (aged to 2014).

Using this methodology, we are proposing to derive 17 detailed cost categories from the proposed 2018-based IPPS market basket residual cost weight (32.4 percent). These categories are: (1) Fuel: Oil and Gas; (2) Electricity and Other Non-Fuel Utilities; (3) Food: Direct Purchases; (4) Food: Contract Services; (5) Chemicals; (6) Medical Instruments; (7) Rubber and Plastics; (8) Paper and Printing Products; (9) Miscellaneous Products; (10) Professional Fees: Labor-Related; (11) Administrative and Facilities Support Services; (12) Installation, Maintenance, and Repair Services; (13) All Other: Labor-Related Services; (14) Professional Fees: Nonlabor-Related; (15) Financial Services; (16) Telephone Services; and (17) All Other: Nonlabor-Related Services.

The 2014-based IPPS market basket had a separate cost category for Water and Sewerage. Due to the size of the estimated cost weight (approximately 0.1 percent), we are proposing that these costs be included in the Electricity and Other Non-Fuel Utilities cost category.

2. Selection of Proposed Price Proxies

After computing the proposed 2018 cost weights for the IPPS market basket, it was necessary to select appropriate wage and price proxies to reflect the rate of price change for each expenditure category. With the exception of the proxy for professional liability insurance (PLI), all the proxies we are proposing are based on Bureau of Labor Statistics (BLS) data and are grouped into one of the following BLS categories:

- Producer Price Indexes—Producer Price Indexes (PPIs) measure the average change over time in the selling prices received by domestic producers for their output. The prices included in the PPI are from the first commercial transaction for many products and some services (*https://www.bls.gov/ppi/*).
- Consumer Price Indexes—Consumer Price Indexes (CPIs) measure the average change over time in the prices paid by urban consumers for a market basket of consumer goods and services (*https://www.bls.gov/cpi/*). CPIs are only used when the purchases are similar to those of retail consumers rather than purchases at the producer level, or if no appropriate PPIs are available.
- Employment Cost Indexes—Employment Cost Indexes (ECIs) measure the rate of change in employee wage rates and employer costs for employee benefits per hour worked. These indexes are fixed-weight indexes and strictly measure the change in wage rates and employee benefits per hour. ECIs are superior to Average Hourly Earnings (AHE) as price proxies for input price indexes because they are not affected by shifts in occupation or industry mix, and because they measure pure price change and are available by both occupational group and by industry. The industry ECIs are based on the NAICS and the occupational ECIs are based on the Standard Occupational Classification System (SOC).

We evaluated the price proxies using the criteria of reliability, timeliness, availability, and relevance:

- Reliability. Reliability indicates that the index is based on valid statistical

[934] *http://www.bea.gov/papers/pdf/IOmanual_092906.pdf.*

methods and has low sampling variability. Widely accepted statistical methods ensure that the data were collected and aggregated in a way that can be replicated. Low sampling variability is desirable because it indicates that the sample reflects the typical members of the population. (Sampling variability is variation that occurs by chance because only a sample was surveyed rather than the entire population.)

- Timeliness. Timeliness implies that the proxy is published regularly, preferably at least once a quarter. The market basket levels are updated quarterly, and therefore, it is important for the underlying price proxies to be up-to-date, reflecting the most recent data available. We believe that using proxies that are published regularly (at least quarterly, whenever possible) helps to ensure that we are using the most recent data available to update the market basket. We strive to use publications that are disseminated frequently, because we believe that this is an optimal way to stay abreast of the most current data available.
- Availability. Availability means that the proxy is publicly available. We prefer that our proxies are publicly available because this will help ensure that our market basket updates are as transparent to the public as possible. In addition, this enables the public to be able to obtain the price proxy data on a regular basis.
- Relevance. Relevance means that the proxy is applicable and representative of the cost category weight to which it is applied.

We believe the proposed PPIs, CPIs, and ECIs selected meet these criteria. Therefore, we believe that they continue to be the best measure of price changes for the cost categories to which they would be applied.

In this rule, we present a detailed explanation of the price proxies that we are proposing for each cost category weight. We note that many of the proxies that we are proposing to use for the proposed 2018-based IPPS market basket are the same as those used for the 2014-based IPPS market basket.

(1) Wages and Salaries

We are proposing to use the ECI for Wages and Salaries for All Civilian Workers in Hospitals (BLS series code CIU10262200000000I) to measure the price growth of this cost category. This is the same price proxy used in the 2014-based IPPS market basket.

(2) Employee Benefits

We are proposing to use the ECI for Total Benefits for All Civilian Workers in Hospitals to measure the price growth of this cost category. This ECI is calculated using the ECI for Total Compensation for All Civilian Workers in Hospitals (BLS series code CIU1016220000000I) and the relative importance of wages and salaries within total compensation. This is the same price proxy used in the 2014-based IPPS market basket.

(3) Fuel: Oil and Gas

Similar to the 2014-based IPPS market basket, we are proposing to use a blend of the PPI Industry for Petroleum Refineries and the PPI Commodity for Natural Gas. Our analysis of the Bureau of Economic Analysis' 2012 Benchmark I–O data (use table before redefinitions, purchaser's value for NAICS 622000 [Hospitals]), shows that approximately 96 percent of hospital Fuel: Oil, and Gas expenses are for Petroleum Refineries (NAICS 324110) and Natural Gas (NAICS 221200) expenses, with Petroleum Refineries expenses accounting for approximately 90 percent and Natural Gas expenses accounting for approximately 10 percent of this sum. We are proposing to create blended index of these expenses based on each NAICS' expenses as share of their sum. Therefore, we are proposing to use a blend of 90 percent of the PPI Industry for Petroleum Refineries (BLS series code PCU324110324110) and 10 percent of the PPI Commodity Index for Natural Gas (BLS series code WPU0531) as the price proxy for this cost category. The 2014-based IPPS market basket used a 70/30 blend of these price proxies, reflecting the 2007 I–O data (82 FR 38163). We believe that these two price proxies continue to be the most technically appropriate indices available to measure the price growth of the Fuel: Oil, and Gas cost category in the proposed 2018-based IPPS market basket.

(4) Electricity and Other Non-Fuel Utilities

We are proposing to use the PPI Commodity for Commercial Electric Power (BLS series code WPU0542) to measure the price growth of this cost category, as Electricity costs account for 93 percent of these expenses. This is the same price proxy used for the Electricity cost category in the 2014-based IPPS market basket. As previously noted, we are proposing to include Water and Sewerage costs within the Electricity and Other Non-Fuel Utilities cost category, and to no longer use the CPI for Water and Sewerage Maintenance as we did for the 2014-based IPPS market basket, due to the small size of this estimated cost weight (approximately 0.1 percent).

(5) Professional Liability Insurance

We are proposing to proxy price changes in hospital professional liability insurance premiums (PLI) using percentage changes as estimated by the CMS Hospital Professional Liability Index. To generate these estimates, we collect commercial insurance medical liability premiums for a fixed level of coverage while holding nonprice factors constant (such as a change in the level of coverage). This is the same price proxy used in the 2014-based IPPS market basket.

(6) Pharmaceuticals

We are proposing to use the PPI Commodity for Pharmaceuticals for Human Use, Prescription (BLS series code WPUSI07003) to measure the price growth of this cost category. This is the same price proxy used in the 2014-based IPPS market basket.

(7) Food: Direct Purchases

We are proposing to use the PPI Commodity for Processed Foods and Feeds (BLS series code WPU02) to measure the price growth of this cost category. This is the same price proxy used in the 2014-based IPPS market basket.

(8) Food: Contract Services

We are proposing to use the CPI for Food Away From Home (All Urban Consumers) (BLS series code CUUR0000SEFV) to measure the price growth of this cost category. This is the same price proxy used in the 2014-based IPPS market basket.

(9) Chemicals

Similar to the 2014-based IPPS market basket, we are proposing to use a four-part blended PPI as the proxy for the chemicals cost category in the proposed 2018-based IPPS market basket. The proposed blend is composed of the PPI Industry for Industrial Gas Manufacturing, Primary Products (BLS series code PCU325120325120P), the PPI Industry for Other Basic Inorganic Chemical Manufacturing (BLS series code PCU32518–32518–), the PPI Industry for Other Basic Organic Chemical Manufacturing (BLS series code PCU32519–32519-), and the PPI Industry for Other Miscellaneous Chemical Product Manufacturing (BLS series code PCU325998325998). We note that the four part blended PPI used in the 2014-based IPPS market basket is composed of the PPI Industry for Industrial Gas Manufacturing (BLS series code PCU325120325120P), the

PPI Industry for Other Basic Inorganic Chemical Manufacturing (BLS series code PCU32518–32518–), the PPI Industry for Other Basic Organic Chemical Manufacturing (BLS series code PCU32519–32519–), and the PPI Industry for Soap and Cleaning Compound Manufacturing (BLS series code PCU32561–32561–). For the 2018-based IPPS market basket, we are proposing to derive the weights for the PPIs using the 2012 Benchmark I–O data. The 2014-based IPPS market basket used the 2007 Benchmark I–O data to derive the weights for the four PPIs (82 FR 38164). We note that in the 2012 I–O data, the share of total chemicals expenses that the Soap and Cleaning Compound Manufacturing (NAICS 325610) represents decreased relative to the 2007 I–O data (from 5 percent to 2 percent), while the share of the total chemicals expenses that the All Other Chemical Product and Preparation manufacturing (NAICS 3259A0) categories represents increased (from 5 percent to 7 percent). As a result, we are proposing to remove the PPI Industry for Soap and Cleaning Compound Manufacturing from the proposed blend for the proposed 2018-based IPPS market basket and replace it with the PPI Industry for Other Miscellaneous Chemical Product Manufacturing (BLS series code PCU325998325998).

Table IV–03 shows the proposed weights for each of the four PPIs used to create the blended index compared to those used for the 2014-based IPPS market basket.

TABLE IV-03.—BLENDED CHEMICAL PPI WEIGHTS

NAICS	Name	2014-Based IPPS Weights	Proposed 2018-Based IPPS Weights
325120	PPI Industry for Industrial Gas Manufacturing	32%	19%
325180	PPI Industry for Other Basic Inorganic Chemical Manufacturing	17%	13%
325190	PPI Industry for Other Basic Organic Chemical Manufacturing	45%	60%
325610	PPI Industry for Soap and Cleaning Compound Manufacturing	6%	n/a
325998	PPI Industry for Other Miscellaneous Chemical Product Manufacturing	n/a	8%

(10) Blood and Blood Products

We are proposing to use the PPI Industry for Blood and Organ Banks (BLS series code PCU621991621991) to measure the price growth of this cost category. This is the same price proxy used in the 2014-based IPPS market basket.

(11) Medical Instruments

We are proposing to use a blended price proxy for the Medical Instruments category, as shown in Table IV–04. The 2012 Benchmark I–O data shows the majority of medical instruments and supply costs are for NAICS 339112—Surgical and medical instrument manufacturing costs (approximately 56 percent) and NAICS 339113—Surgical appliance and supplies manufacturing costs (approximately 43 percent). Therefore, we are proposing to use a blend of these two price proxies. To proxy the price changes associated with NAICS 339112, we propose using the PPI—Commodity—Surgical and medical instruments (BLS series code WPU1562). This is the same price proxy we used in the 2014-based IPPS market basket. To proxy the price changes associated with NAICS 339113, we are proposing to use a 50/50 blend of the PPI—Commodity—Medical and surgical appliances and supplies (BLS series code WPU1563) and the PPI—Commodity—Miscellaneous products—Personal safety equipment and clothing (BLS series code WPU1571). We are proposing to include the latter price proxy as it would reflect personal protective equipment including but not limited to face shields and protective clothing. The 2012 Benchmark I–O data does not provide specific expenses for these products; however, we recognize that this category reflects costs faced by IPPS hospitals.

TABLE IV-04.—BLENDED MEDICAL INSTRUMENTS PPI WEIGHTS

NAICS	Name	2014-Based IPPS Weights	Proposed 2018-Based IPPS Weights
339112	PPI - Commodity - Surgical and medical instruments	50%	56%
339113	PPI - Commodity - Medical and surgical appliances and supplies	50%	22%
	PPI - Commodity - Miscellaneous products-Personal safety equipment and clothing	n/a	22%

(12) Rubber and Plastics

We are proposing to use the PPI Commodity for Rubber and Plastic Products (BLS series code WPU07) to measure the price growth of this cost category. This is the same price proxy used in the 2014-based IPPS market basket.

(13) Paper and Printing Products

We are proposing to use the PPI Commodity for Converted Paper and Paperboard Products (BLS series code WPU0915) to measure the price growth of this cost category. This is the same price proxy used in the 2014-based IPPS market basket.

(14) Miscellaneous Products

We are proposing to use the PPI Commodity for Finished Goods Less Food and Energy (BLS series code WPUFD4131) to measure the price growth of this cost category. This is the same price proxy used in the 2014-based IPPS market basket.

(15) Professional Fees: Labor-Related

We are proposing to use the ECI for Total Compensation for Private Industry Workers in Professional and Related (BLS series code CIU2010000120000I) to measure the price growth of this category. It includes occupations such as legal, accounting, and engineering services. This is the same price proxy used in the 2014-based IPPS market basket.

(16) Administrative and Facilities Support Services

We are proposing to use the ECI for Total Compensation for Private Industry Workers in Office and Administrative Support (BLS series code CIU2010000220000I) to measure the price growth of this category. This is the same price proxy used in the 2014-based IPPS market basket.

(17) Installation, Maintenance, and Repair Services

We are proposing to use the ECI for Total Compensation for All Civilian Workers in Installation, Maintenance, and Repair (BLS series code CIU1010000430000I) to measure the price growth of this cost category. This is the same proxy used in the 2014-based IPPS market basket.

(18) All Other: Labor-Related Services

We are proposing to use the ECI for Total Compensation for Private Industry Workers in Service Occupations (BLS series code CIU2010000300000I) to measure the price growth of this cost category. This is the same price proxy used in the 2014-based IPPS market basket.

(19) Professional Fees: Nonlabor-Related

We are proposing to use the ECI for Total Compensation for Private Industry Workers in Professional and Related (BLS series code CIU2010000120000I) to measure the price growth of this category. This is the same price proxy that we are proposing to use for the Professional Fees: Labor-Related cost category and the same price proxy used in the 2014-based IPPS market basket.

(20) Financial Services

We are proposing to use the ECI for Total Compensation for Private Industry Workers in Financial Activities (BLS series code CIU201520A000000I) to measure the price growth of this cost category. This is the same price proxy used in the 2014-based IPPS market basket.

(21) Telephone Services

We are proposing to use the CPI for Telephone Services (BLS series code CUUR0000SEED) to measure the price growth of this cost category. This is the same price proxy used in the 2014-based IPPS market basket.

(22) All Other: Nonlabor-Related Services

We are proposing to use the CPI for All Items Less Food and Energy (BLS series code CUUR0000SA0L1E) to measure the price growth of this cost category. We believe that using the CPI for All Items Less Food and Energy avoids double counting of changes in food and energy prices as they are already captured elsewhere in the market basket. This is the same price proxy used in the 2014-based IPPS market basket.

Table IV–05 sets forth the proposed 2018-based IPPS market basket, including the cost categories and their respective weights and price proxies. For comparison purposes, the corresponding 2014-based IPPS market basket cost weights also are listed.

BILLING CODE 4120–01–P

TABLE IV-05.—PROPOSED 2018-BASED IPPS MARKET BASKET COST CATEGORIES, COST WEIGHTS, AND PRICE PROXIES COMPARED TO 2014-BASED IPPS MARKET BASKET COST WEIGHTS

Cost Categories	2014-Based IPPS Market Basket Cost Weights	Proposed 2018-Based IPPS Market Basket Cost Weights	Proposed 2018-Based IPPS Market Basket Price Proxies
1. Compensation	55.8	53.0	--
A. Wages and Salaries[1]	43.4	41.2	ECI for Wages and Salaries for All Civilian Workers in Hospitals
B. Employee Benefits[1]	12.4	11.7	ECI for Total Benefits for All Civilian Workers in Hospitals
2. Utilities	2.5	2.3	--
A. Electricity and Other Non-Fuel Utilities[2]	1.1	1.5	PPI Commodity for Commercial Electric Power
B. Fuel: Oil and Gas	1.3	0.8	Blend of PPIs for Petroleum Refineries and Natural Gas
3. Professional Liability Insurance	1.2	1.0	CMS Hospital Professional Liability Insurance Premium Index
4. All Other	40.5	43.8	--
A. All Other Products	17.4	18.4	--
(1.) Pharmaceuticals	5.9	7.1	PPI Commodity for Pharmaceuticals for Human Use, Prescription
(2.) Food: Direct Purchases	2.3	1.6	PPI Commodity for Processed Foods and Feeds
(3.) Food: Contract Services	1.3	1.8	CPI for Food Away From Home (All Urban Consumers)
(4.) Chemicals	0.9	0.6	Blend of Chemical PPIs
(5.) Blood and Blood Products	0.8	0.6	PPI Industry for Blood and Organ Banks
(6.) Medical Instruments	2.9	4.1	Blend of PPIs

Cost Categories	2014-Based IPPS Market Basket Cost Weights	Proposed 2018-Based IPPS Market Basket Cost Weights	Proposed 2018-Based IPPS Market Basket Price Proxies
(7.) Rubber and Plastics	0.8	0.6	PPI Commodity for Rubber and Plastic Products
(8.) Paper and Printing Products	1.5	0.9	PPI Commodity for Converted Paper and Paperboard Products
(9.) Miscellaneous Products	1.1	1.2	PPI Commodity for Finished Goods less Food and Energy
B. Labor-Related Services	12.5	14.7	--
(1.) Professional Fees: Labor-Related	6.8	8.6	ECI for Total Compensation for Private Industry Workers in Professional and Related
(2.) Administrative and Facilities Support Services	1.0	1.1	ECI for Total Compensation for Private Industry Workers in Office and Administrative Support
(3.) Installation, Maintenance and Repair Services	2.4	2.4	ECI for Total Compensation for Civilian Workers in Installation, Maintenance, and Repair
(4.) All Other: Labor-Related Services	2.3	2.6	ECI for Total Compensation for Private Industry Workers in Service Occupations
C. Nonlabor-Related Services	10.7	10.7	--
(1.) Professional Fees: Nonlabor-Related	5.1	7.0	ECI for Total Compensation for Private Industry Workers in Professional and Related
(2.) Financial Services	3.0	1.4	ECI for Total Compensation for Private Industry Workers in Financial Activities
(3.) Telephone Services	0.8	0.4	CPI for Telephone Services
(4.) All Other: Nonlabor-Related Services	1.7	1.8	CPI for All Items less Food and Energy
Total	100.0	100.0	--

Note: The cost weights are calculated using three decimal places. For presentational purposes, we are displaying one decimal and, therefore, the detail may not add to the total due to rounding.

[1] Contract labor is distributed to wages and salaries and employee benefits based on the share of total compensation that each category represents.

[2] We are proposing to include Water and Sewerage costs in the Electricity and Non-Fuel Utilities cost category in the proposed 2018-based IPPS market basket. These costs were broken out separately in the 2014-based IPPS market basket.

Table IV–06 compares both the historical and forecasted percent changes in the 2014-based IPPS market basket and the proposed 2018-based IPPS market basket. The forecasted growth rates in Table IV–06 are based on IHS Global Inc.'s (IGI's) fourth quarter 2020 forecast with historical data through third quarter 2020.

TABLE IV-06.--2014-BASED AND PROPOSED 2018-BASED IPPS HOSPITAL OPERATING INDEX PERCENT CHANGE, FY 2017 THROUGH FY 2024

Fiscal Year (FY)	2014-Based IPPS Market Basket Percent Change	Proposed 2018-Based IPPS Market Basket Percent Change
Historical data:		
FY 2017	2.6	2.5
FY 2018	2.5	2.5
FY 2019	2.4	2.4
FY 2020	2.0	2.0
Average FYs 2017-2020	**2.4**	**2.4**
Forecast:		
FY 2021	2.4	2.4
FY 2022	2.5	2.5
FY 2023	2.8	2.7
FY 2024	3.0	3.0
Average FYs 2021-2024	**2.7**	**2.7**

Source: IHS Global, Inc., 4th Quarter 2020 forecast.

BILLING CODE 4120–01–C

There is no difference between the average percent change in the 2014-based and the proposed 2018-based IPPS market basket over the FY 2017 through FY 2020 time period. For FY 2022, the increase is projected to be 2.5 percent for both the 2014-based and proposed 2018-based IPPS market baskets.

3. Labor-Related Share

Under section 1886(d)(3)(E) of the Act, the Secretary estimates from time to time the proportion of payments that are labor-related. Section 1886(d)(3)(E) of the Act states that the Secretary shall adjust the proportion, (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs, of the DRG prospective payment rates. We refer to the proportion of hospitals' costs that are attributable to wages and wage-related costs as the ''labor-related share.''

The labor-related share is used to determine the proportion of the national PPS base payment rate to which the area wage index is applied. We include a cost category in the labor-related share if the costs are *labor intensive* and *vary with the local labor market.* For this FY 2022 IPPS/LTCH PPS proposed rule, we are proposing to include in the labor-related share the national average proportion of operating costs that are attributable to the following cost categories in the proposed 2018-based IPPS market basket: Wages and Salaries, Employee Benefits, Professional Fees: Labor-Related, Administrative and Facilities Support Services, Installation, Maintenance, and Repair Services, and All Other: Labor-Related Services, as we did in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38167).

Similar to the 2014-based IPPS market basket, we are proposing that the Professional Fees: Labor-Related cost category includes expenses associated with advertising and a proportion of legal services, accounting and auditing, engineering, and management consulting. As was done in the 2014-based IPPS market basket rebasing, we are proposing to determine the proportion of legal, accounting and auditing, engineering, and management consulting services that meet our definition of labor-related services based on a survey of hospitals conducted by CMS in 2008. We notified the public of our intent to conduct this survey on December 9, 2005 (70 FR 73250) and received no comments (71 FR 8588).

A discussion of the composition of the survey and poststratification can be found in the FY 2010 IPPS/LTCH PPS final rule (74 FR 43850 through 43856). Based on the weighted results of the survey, we determined that hospitals purchase, on average, the following portions of contracted professional services outside of their local labor market:

- 34 percent of accounting and auditing services.
- 30 percent of engineering services.
- 33 percent of legal services.
- 42 percent of management consulting services.

We are proposing to apply each of these percentages to its respective Benchmark I–O cost category underlying the professional fees cost category. This is the methodology that we used to separate the 2014-based IPPS market basket professional fees cost category into Professional Fees: Labor-Related and Professional Fees: Nonlabor-Related cost categories. We are proposing to use the same methodology and survey results to separate the professional fees costs for the proposed 2018-based IPPS market basket into Professional Fees: Labor-Related and Professional Fees: Nonlabor-Related cost categories. We believe these survey results are appropriate to use for the proposed 2018-based IPPS market basket as they empirically determine the proportion of contracted professional services purchased by the industry that is attributable to local firms and the proportion that is purchased from national firms.

In the proposed 2018-based IPPS market basket, nonmedical professional fees that were subject to allocation based on these survey results represent approximately 6.4 percent of total operating costs (and are limited to those fees related to Accounting & Auditing, Legal, Engineering, and Management Consulting services). Based on our survey results, we are proposing to apportion 4.1 percentage points of the 6.4 percentage point figure into the

Professional Fees: Labor-Related share cost category and designate the remaining approximately 2.3 percentage points into the Professional Fees: Nonlabor-Related cost category.

In addition to the professional services listed earlier, we also classify a proportion of the Home Office/Related Organization cost weight into the Professional Fees: Labor-Related cost category as was done in the previous rebasing. We believe that many of these costs are labor-intensive and vary with the local labor market. However, data indicate that not all IPPS hospitals with home offices have home offices located in their local labor market. Therefore, we are proposing to include in the labor-related share only a proportion of the Home Office/Related Organization cost weight based on the methodology described in this rule.
